There are fertilizing marls and gypsums, brown coal or lignite in beds of six inches to eight feet, and beds of hematite. Beyond the tertiary lies a wide range of cretaceous formations, beds of limestone, sandstone, clays, marls, and beyond these, 5000 sq. m. of coal-measures, four distinct seams, of eight or nine feet in all, resting on fire-clay. There are also fine marbles, and some deposits of lead and copper. The soil is of great fertility, the coast producing the finest cotton, sugar, &c.; and the interior, wheat, Indian corn, tobacco, fruits of all kinds, with abundant pasturage—making it one of the finest cattle-countries in the world. The climate is pure, temperate, and remarkably salubrious. The thermometer ranges from an average of 84° F., the hottest month in summer, to 50°, the coldest month in winter. The eastern region is rainy; the middle, moderate; the south-western, dry. The vegetation is in the greatest variety, from the oak, cedar, and pine, to the palmetto, muskeet, and nopal, which feeds the cochineal insect, with figs, oranges, grapes, vanilla, and flowers in wonderful profusion. The prairies abound in buffalo, immense herds of wild horses, and the forest with deer. There are also the puma, jaguar, black bear, wolf, &c. The coasts, bays, and rivers abound in the finest fish, shell-fish, turtles, &c. Though the country is generally level, it is not destitute of wild and grand scenery. In some places are found gigantic animal fossils and silicified trees. There is a large trade with Mexico, and by the Red River and Gulf with New Orleans. The chief exports are cotton, sugar, tobacco, cattle, and wool. The value of these and other commodities produced in 1881–82 in T. was about £20,000,000; of this amount, about £10,000,000 was the value of the cotton produced, which was 878,854 bales. The produce of wool was 22,300,000 lbs.; of hides, 13,572,000 lbs.; and the estimated value of cattle was £3,200,000, and of horses and mules, £200,000. The state deaf and dumb, orphan, blind, and lunatic asylums have each an endowment of 100,000 acres of state lands. The state debt in 1881 was 4,491,000 dollars: the value of assessed property is over 300,000,000 dollars. In the same year there were about 6000 miles of railway in the state.

La Salle, the French explorer, erected a fort on Matagorda Bay, 1687. A Spanish settlement and mission was formed in 1690, but soon abandoned. In 1715, the country was settled by

the Spaniards, under the name of New Philippines, and several missions established; but the Comanche and Apache Indians, among the most warlike in America, and still the terror of the border settlements, hindered the progress of the country. In 1803, when Louisiana was ceded by France to the U. S., T., claimed by both Spain and the U. S., became a disputed territory. From 1806 to 1816, settlements were formed, and several attempts made to wrest the country from Spain. In one of these, in 1813, 2500 Americans and Mexicans were killed, and 700 inhabitants of San Antonia. Mina, a Spanish refugee, gained some successes, but was defeated and shot. Lafitte, a Gulf pirate, made a settlement at Galveston in 1815, but it was broken up in 1821. In 1819 the river Sabine was established as the boundary. In 1820, Moses Austin, an American, got a large grant of lands in T. from the Mexican government, and began a settlement, which rapidly increased; but many of the settlers were of so lawless a character, that in 1830, the government forbade any more Americans coming into Texas. In 1833, a convention of settlers, now 20,000 in number, made an unsuccessful attempt to form an independent Mexican state; and in 1835, a provisional government was formed, Sam Houston (q. v.) chosen commander-in-chief, and the Mexicans driven out of Texas. Santa Anna, President of Mexico, invading the country with an army of 7500, after some successes, was entirely routed at San Jacinto, April 21; and T. became an indepedent republic, acknowledged 1837 by the U. S., and in 1840 by England, France, and Belgium. In December 1845, T. was annexed to the U. S., but was invaded by Mexico, which had never acknowledged its independence, and thus originated the war with the United States. In Feb. 1861, T. joined the secession. Not till 1870 was the state re-admitted to representation in congress, and regular civil government restored. In 1876, a new constitution was adopted by the vote of the people.

TEXEL, THE, an island in the province of North Holland, separated from the Helder by a narrow strait, called the Marsdiep, contains about 35,000 acres of arable and pasture lands, and has a population of 6408. Many sheep are kept, producing fine wool. Fishing, ship-building, grinding corn, &c., are also sources of prosperity. There is much wealth in the island, but recently no steamboat communication existed with the mainland. The northern part is called Eijerland, or the egg-country, immense flocks of birds coming thither from Scandinavia to deposit their eggs.

TE'XTILE FABRICS. See WEAVING.

TEZCU'CO (i. e., 'place of detention'), an ancient and much decayed city of Mexico, stands on the east shore of the lake of the same name in the state, and 16 miles east-north-east of the city of Mexico. In former times, it was the capital of a great state, and was the second city in Mexico. During the early part of the 15th c., the city rose to its greatest splendor. It then contained ranges of stately mansions, in which the nobles resided, and a magnificent and vast pile of buildings, which served as the royal residence and as public offices. T. is now a poor place, filled with heaps of rubbish and ruins, and containing only 5000 inhabitants.

THACKERAY, WILLIAM MAKEPEACE, novelist and satirist, was born at Calcutta in 1811. He was of a good old English family, represented about the middle of last century by Dr. Thackeray, an eminent scholar, and head-master of Harrow. His father was in the civil service of the East India Company, and dying young, he left his son a fortune of £20,000. The latter, when a boy of seven year of age, was sent to England and placed in the Charterhouse School, that ancient Carthusian foundation, which he loved to commemorate in his writings. He next went to Cambridge, but left the university without taking a degree. In 1831 he was at Weimar, and saw Goethe. His ambition was to become an artist, and he traveled over most of Europe, studying at Paris and Rome. His drawings were not without merit; they were quaint, picturesque, and truthful, but somehow they missed the bright touches of a master-hand. He next took to literature, beginning with rare patience and contentment at the lowest step of the ladder. Under the characteristic name of Michael Angelo Titmarsh, or that of Fitz-Boodle, he became a constant contributor to *Fraser's Magazine*, and wrote for it two of the best of his minor works, *The Great Hoggarty Diamond* and *Barry Lyndon*. The latter is the story of an Irish sharper, and is told with a spirit, variety of adventure, and humor worthy of Le Sage or Fielding. Under the pseudonym of Titmarsh, he also published *The Paris Sketch-book* (2 vols. 1840), *The Second Funeral of Napoleon*, and *Chronicle of the Drum* (1841) and the *Irish Sketch-book* (2 vols., 1843). The greater part of T.'s fortune having been spent in foreign travel and unsuccessful speculations at home, he continued to work steadily at literature as a profession. He was never widely popular, but a few good judges appreciated his keen wit, observation, and irony, and his command of a style singularly pure, clear, and unexaggerated. The establishment of *Punch* afforded a more congenial field for T., and his *Snob Papers* and *Jeames's Diary* were hailed with delight by all readers. Their author's reputation was still more advanced by his novel of *Vanity Fair* (1846—1848), published in monthly parts in the style of *Pickwick*, and illustrated by the novelist himself, or, as he expressed it, 'illuminated with the author's own candles.'

During the progress of *Vanity Fair* appeared *Notes of a Journey from Cornhill to Grand Cairo*, being an account of a journey undertaken for the benefit of his health; also *Mrs. Perkin's Ball*, a short Christmas tale, and two works of a similar kind entitled *Our Street*, and *Dr. Birch and his Young Friends*. In 1849, he began a second serial fiction, *Pendennis*, in which much of his own history and experiences are recorded. Next followed *Rebecca and Rowena* (1850), and *The Kicklebury's on the Rhine* (1851). The latter work was sharply criticised by the *Times*, and T. replied in a caustic and humorous *Essay on Thunder and Small Beer*, prefixed to a second edition of the satirical sketch. In 1851, the indefatigable novelist delivered a course of lectures on the *English Humorists of the Eighteenth Century*—light, graceful, discriminating sketches, with passages of real power and eloquence. In 1852—1855, appeared two more novels, the most richly imaginative and highly finished of his works, *Esmond* and *The Newcomes*. These were followed by *The Virginians* (a much inferior novel), by *Lectures on the Four Georges* (first delivered in America), by *Lovel the Widower* and *Philip* (two short tales of somewhat coarse texture), and by a series of pleasant gossiping essays, entitled *Roundabout Papers*. These originally appeared in the *Cornhill Magazine*, of which T. was for a time editor; and in the same miscellany he had begun and published part of a new novel, *Dennis Duval*, which promised to be one of the most carefully elaborated and successful of his works of fiction. He contemplated also *Memoirs of the Reign of Queen Anne*, which would have served as a continuation to Macaulay's *History*. He knew that period well, from his previous studies for *Esmond*, and as a moral anatomist and master of English he stood unrivalled. But, alas! such dreams and anticipations were suddenly dispelled. To the grief of all lovers of genius and of manly and noble character, T. was cut off in the fulness of his powers in his 52d year, dying alone and unseen in his chamber before daybreak on the morning of the 24th of December 1863. His medical attendants found that death was caused by effusion on the brain, and that his brain was one of the largest, weighing no less than 58½ ounces.

In his delineation of the character and genius of Fielding, T. has drawn his own. He had the same hatred of all meanness, cant, and knavery, the same large sympathy, relish of life, thoughtful humor, keen insight, delicate irony, and wit. There was, however, one personal difference: Fielding was utterly careless as to censure of his works, whereas his successor was tremblingly alive to criticism, and was wounded to the quick by the slightest attack. His morbidly delicate organization made him exquisitely susceptible of either pain or pleasure. He had suffered much from physical maladies and from domestic calamity; and his earlier works, especially his *Vanity Fair*, were tinged with a degree of cynicism which seemed to countenance the charge of his unfriendly critics, that he delighted in representing the baser side of human nature, and was sceptical as to the existence of real virtue in the world. His strength lay in portraying character rather than inventing incidents; and in Becky Sharp, Colonel Newcome, Harry Foker, Laura Pendennis, and Paul de Florac, to say nothing of the picaroon, Barry Lyndon, he has left us a living gallery, certainly not surpassed by any modern novelist. In his later writings, the dark shades no longer preponderate. The mellowing influence of years and sickness, and calmer as well as more extensive observation of life, had sunk the merciless satirist in the genial humorist and philosophic observer. He had still ample scorn for falsehood and vice, and satire for folly and pretence; but he had also smiles and tears, and tenderness and charity, that gave a moral beauty and interest to the last decade of his brilliant career as an author. In deference to his wishes, no adequate biography of T. has yet appeared. See Trollope's *Thackeray* (1879); *English Men of Letters Series*. Besides several popular and uniform editions, a splendid *edition de luxe* of his writings, in 24 vols., appeared in 1881.—T.'s eldest and only surviving daughter, Anne Isabella (Mrs. Richmond Ritchie), is a careful and finished writer of fiction. Her novels are chiefly studies of character, within somewhat confined limits. She has issued amongst other works, *To Esther* (1869); *Old Kensington* (1873); *The Story of Elizabeth* (1876); and *Miss Williamson's Divagations* (new ed. 1882).

THA'IS, an Athenian courtesan, famous for her wit and beauty, who was in Asia along with Alexander the Great, and according to Cleitarchus—a doubtful authority—induced the Macedonian king, when excited with wine, to set fire to the palace of the Persian kings at Persepolis. After his death, she lived with Ptolemy Lagi, by whom she became the mother of several children.

THALASSIDRO'MA. See PETREL.

THALBERG, SIGISMUND, a very eminent pianist, born at Geneva in 1812, received the greater part of his musical education

at Vienna, where he was a pupil of Hummel. He made his first public appearance in 1827, and his *début* in Paris in 1835. After residing for a time in America, he returned to Europe, and died 27th April 1871. In graceful and brilliant execution, and in manual dexterity on the piano, he had hardly a rival. His compositions are principally fantasias and variations.

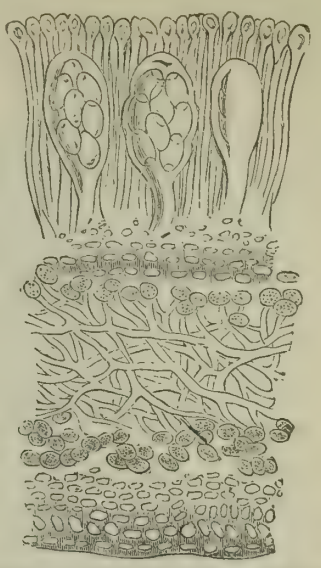
THALEI'A or THALIA (Gr. the blooming one), one of the nine Muses (q. v.), generally regarded as presiding over comedy. By Apollo, T. became the mother of the Corybantes.

THA'LÉS, an early Greek philosopher, founder of the Ionicor physical school of philosophy, and one of the Seven Wise Men (q. v.), was a native of Miletus, in Asia Minor, and flourished towards the close of the 7th c. B.C. Very little is known regarding his life. He is said to have recommended the Ionians, who were menaced by the Persians, to form a federation against their powerful enemy, and to select Teos as the capital. At a later period, we are told he induced the Milesians to withdraw from a union with Crœsus against Cyrus. He is also said to have predicted the eclipse of the sun which happened in the reign of Alyattes. His claim to the title of sage (as in the case of his compeers) was due to his practical wisdom rather than to his speculative achievements. Nevertheless, T. has a name in the history of speculative philosophy. He is even regarded by some as the *first* Greek that speculated on the constitution of the universe. According to him, the original principle of all things is water, from which everything proceeds, and into which it is again resolved. It would appear also that in connection with this doctrine he had some idea of a soul or force in water productive of all the phenomena we see. None of T.'s speculations were committed to writing, and it is only from the notices of later Greeks, such as Herodotus, Aristotle, &c., that we can gather an idea of his thinking.

THA'LLIUM (symb. Tl, equiv. 204, spec. grav. 11·9) is a metal which derives its name from the Greek word *thallos*, green, because its existence was first recognized by an intense green line appearing in the spectrum of a flame in which T. is volatilized. It was discovered by Mr. Crookes in 1861, in the seleniferous deposit of a lead chamber of a sulphuric acid factory in the Harz Mountains; and it was soon obtained in large quantities by M. Lamy. T. is slightly heavier than lead—a metal which it resembles in its physical properties. It is very soft, being readily cut with a knife, or drawn into wire; and its freshly-cut surface exhibits a brilliant metallic lustre and grayish color, somewhat between those of silver and lead. In contact with the air, it tarnishes more rapidly than lead, and becomes coated with a thin layer of oxide, which preserves the rest of the metal. It fuses at 290° C., and at a red heat becomes volatilized. It is crystalline in structure, crackles like tin when bent, but is highly malleable. The metal and its compounds give a bright green tint to colorless flames; the spectrum of T. is marked by a single sharply defined green line. It is used to produce a green light in firework displays, and is employed to render glass highly refractive. The metal can best be preserved free from oxidation by being covered with paraffin and kept below water. T. forms a number of compounds, including three oxides. Thallous oxide (Tl_2O) is the most important; it is easily soluble in water, producing a caustic alkaline solution. There was long a difference of opinion as to whether the salts of T. are or are not powerful irritant poisons. Lamy, by a series of experiments on animals, completely satisfied himself that they are, a very small quantity sufficing to destroy hens and puppies. Mr. Crookes was long inclined to an opposite opinion; but it is now agreed that the salts of T. are poisonous.—For further details regarding this metal, see Mr. Crookes's Memoirs in the *Philosophical Transactions* for 1862, and in the *Chemical News* for 1874, and Lamy's Memoir in the *Annales de Chimie et de Physique* for 1863.

THALLO'GENOUS PLANTS, are those acotyledonous plants which exhibit the greatest simplicity of structure, consisting of a mere Thallus (q. v.) with reproductive organs. Of this description are *Algæ*, *Characeæ*, *Fungi*, and *Lichens*. When apparent leaves exist in any of these, they do not exhibit the symmetry always found in true leaves; and although some of them have stems or stalks, which attain, as in some sea-weeds, both to a considerable age and to great strength, all is composed of cellular tissue without any proper woody fibre.—In the botanical system of Lindley, the T. P. form a class, under the name *Thallogens;* and in that of Endlicher, a corresponding place is assigned to them under the name *Thallophyta*.

THA'LLUS, in Botany, a structure composed of cellular tissue, without woody fibre, which in some of the lower cryptogamic orders, as *Algæ*, *Fungi*, and *Lichens*, constitutes the whole plant, except the reproductive organs, which are situated in or upon it. The T. assumes very various forms, sometimes crust-like, sometimes spread out like a leaf, simple, lobed, or branched; or, as in mushrooms, it becomes a stalk, cap, and gills.



Vertical Section of Thallus of *Parmelia parietina*, showing spores, &c

Copied from Lindsay's *British Lichens* (London: Routledge).

THAMES (Lat. Tam-*esis*; the root *tam* probably meaning broad, and *esis* or *isis*, being identical with *esk*, *ex*, *ouse*, &c., all from Cel. *uisg*, water), the most important river of Great Britain, and the longest in England, flows east-south-east across the south portion of the country. Its remotest springs—those of the upper waters of the Churn—rise on the south-east slope of the Cotswold Hills, 3 miles south of Cheltenham, and 7 miles west of the Severn at Gloucester. The springs unite about a mile from their sources, and form the Churn, which flows south-east 20 miles to Cricklade, and there receives the T., which joins it from the west after a course of 10 miles. The T., or Isis, then flows east-north-east for about 35 miles, when, curving south-east it passes Oxford, and flows on to Reading, where, after receiving the Kennet from the west, it again changes its course: and with a generally eastward course it passes Windsor, Eton, Richmond, London, Woolwich, and Gravesend, a few miles below which it expands into a wide estuary, and enters the North Sea. The length of the T. is estimated at 250 miles, the area of its basin at upwards of 6000 sq. miles. Throughout the greater part of its course, it is of importance as forming the boundary-line between several of the southern counties. Passing Cricklade, it forms part of the northern boundary of Wilts, and below this point it separates the counties of Oxford, Buckingham, Middlesex, and Essex on the north from those of Berks, Surrey, and Kent on the south, except certain outlying bits of some of these counties. Its chief affluents are the Coln, Leach, Windrush, Cherwell, Thame, Colne, Lea, and Roding, on the left; and the Kennet, Loddon, Darent, Mole, and Medway, on the right bank.

At Vauxhall Bridge, the width of the river is about 230 yards; at London Bridge, 290 yards; at Woolwich, 490 yards; at Gravesend Pier, 800 yards; three miles below Gravesend, 1290 yards; and at its mouth, between Whitstable and Foulness Point, about 8 miles below the Nore, it is 18 miles across. At the Nore Light, the commonly reputed mouth of the T., the breadth is 6 miles. The river is navigable for barges to Lechlade, upwards of 200 miles above its mouth, and it is connected with the Thames and Severn, Oxford, Wilts and Berks, Grand Junction, and several other important canals, by means of which it maintains free communication with the west and south coasts, and with all parts of the interior of the country. Vessels of 800 tons can reach St. Katharine's Docks, while those of 1400 tons can ascend to Blackwall, 6 miles below London Bridge. The part of the river immediately below London Bridge is called the *Pool;* and the part between the Bridge and Blackwall is called the *Port*. Two embankments have been formed, one on the north shore from Blackfriars Bridge to Westminster, and one on the south shore from Westminster Bridge to Vauxhall. See LONDON.

THANA'TICI is the term used by the Superintendent of the Statistical Department in the Registrar-general's Office, Dr. Farr, in his *Nosology*, to indicate 'lesions from violence tending to sudden death.' These lesions are the direct results of physical or chemical forces, acting either by the will of the sufferer or of other persons, or accidentally.

THANE, or THEGN (A.-S. *thenien*, analogous to Ger. *dienen*, to serve), a title whose use in the early feudal ages has been the subject of much discussion. In England, in Saxon times, the king's thane was a 'miles emeritus,' who, on the cessation of his actual service about the king's person, received a benefice or grant of land. The term 'miles,' when used by Bede, is uniformly rendered 'cyninges thegn' by his Saxon translator.

In the 10th c., all who would, in the feudal era, have been known as tenants *in capite*, were thanes. After the Conquest, thanes and barons are classed together; and in Henry I.'s time, the terms seem to be used synonymously. The office or dignity appears to have been attached to particular estates; thane lands are frequently mentioned in Domesday. After the reign of Henry II., the term fell into disuse. The title thane was introduced at a later period into the northern parts of Scotland, where, however, it did not express the same rank and dignity as in England; the tenure not being military, but in fee-farm.—The Scottish thane seems to have been a hereditary tenant, paying the sum at which the land stood in the king's rental, and retaining his ancient authority strengthened and legalized. The title was in occasional use in Scotland down to the end of the 15th century. Hector Boece's notion of the Scottish thanes being all made earls, which has been adopted in Shakspeare's *Macbeth*, is devoid of historical foundation.

THA'NET, ISLE OF, forms the north-eastern corner of the county of Kent (q. v.), from the mainland of which it is cut off by the river Stour and its branches, and is bounded on the N. and E. by the sea. It is 10 miles in length, and from 4 to 8 miles broad; and contains 26,500 acres, of which 23,000 are arable, and 3500 in marsh and pastures. The surface is high, but in the main, level; the soil is in general light and chalky; the island, however, is rich and fruitful—agriculture being successfully pursued. Besides the ordinary crops, canary and radish seeds are largely grown. On the shores of the island are the well-known watering-places, Ramsgate, Margate, and Broadstairs; and on the North Foreland, in the north-east, there is a light-house, 340 feet above sea-level, and visible at the distance of 22 miles. Pop. (1871) 42,129; (1881) 50,646.

The Isle of T., the British name of which was *Ruim* (a headland), was at one time separated from the mainland by a sea-passage, called the Wantsome, which in Bede's time was one-third of a mile wide, and was passable only at Sarre and Wade. The Wantsome was the general sea-passage toward London for the Danish ships, but in 1500 it became finally closed.

THANN, a town of Germany, in the province of Alsace-Lorraine, at the foot of a hill crowned by the ruins of the castle of Engelburg, 13 miles west-north-west of Mulhouse. It contains a superb Gothic church, surmounted by a spire of delicate open work, upwards of 300 feet high. Cotton cloths, chemicals, and machinery are manufactured. Pop. (1875) 7532; (1880) 7535.

THA'SOS, the most northerly island in the Ægean Sea, a few miles off the coast of Macedonia. Circumference about 40 miles; pop. about 5000, scattered over a dozen villages. T. is mountainous, and on the whole, barren. The description of it given by Archilochus is still applicable: 'An ass's backbone overspread with wild wood.' It exports some oil, honey, and timber. In ancient times, the island was famous for its gold mines, which appear to have been worked from a very remote antiquity, and which, immediately before the Persian wars, yielded upwards of 300 talents yearly; but they have long since been abandoned. Some remains of the ancient town of T. still exist.

THEA. See TEA.

THE'ATER, a place for public representations, chiefly of a dramatic or musical description. Theaters are of very ancient origin. They were found in every Greek city, both at home and in the colonies, and many very interesting specimens of the Greek theaters still exist in very good preservation. These were not built like modern theaters, with tiers of galleries rising one over the other, but were constructed with concentric rows of seats rising in regular succession one behind and above the other like the steps of stairs. These seats were frequently cut in the solid rock; and a place where the natural curve and slope of the ground rendered such excavation easy, was generally chosen. The seats, or audience department, were arranged in a semicircular form. In the center, at the lowest point, stood the orchestra; and the proscenium, or place for the dramatic representation, formed the chord of the semicircular auditorium. Behind this was the scena, closing in the building with a solid wall, generally ornamented with pillars, cornices, &c. There was no roof, but the audience was probably protected from the sun's rays by a curtain stretching across the theater. This form of theater was also that adopted by the Romans, who built or excavated large theaters in many of their important towns. The theaters of the Romans differed from their *Amphitheaters* (q. v.), the former being semicircular, the latter oval, and with seats all round. Of the theaters still remaining, that of Orange, in the south of France, is one of the finest, the auditorium being 340 feet in diameter. The illustration (fig. 1) shows the general form of these ancient theaters; and in this case the scena is more elaborate than usual. During the middle ages, theaters were unnecessary, and were never built. The few dramatic performances then in use, which were chiefly of the nature of holy mysteries, were represented in the cathedrals. From the remains still existing, however, there would seem to have been large open-air theaters at an early age in this country. Of these, Piran Round in Cornwall is the best example. It is circular, with raised platforms all round for spectators, after the manner of the Greek theaters.

With the revival of classical literature in the 16th c., the classical drama was also reproduced, and naturally along with it the classical form of theater. The first specimens of what may be called modern theaters (although founded on the old Greek model, according to Vitruvius's description) were the Theatro Olympico, erected by Palladio in Vicenza; a similar one in Venice, also by Palladio; and another in Vicenza, by Serlio. In Italy and Spain, open courtyards, with galleries round them, were at

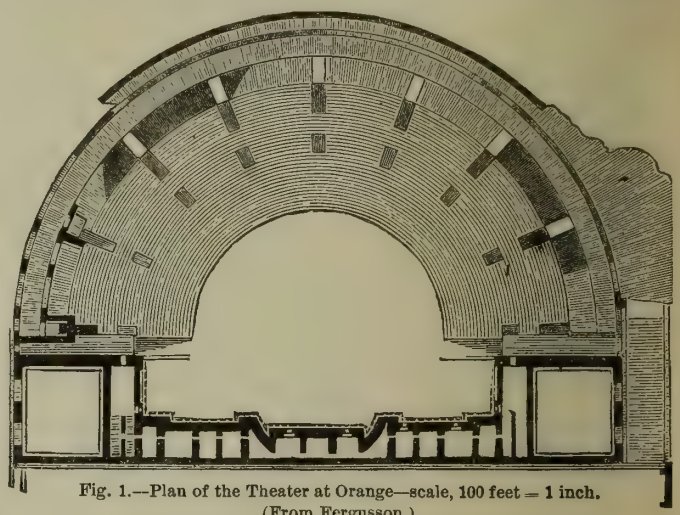


Fig. 1.—Plan of the Theater at Orange—scale, 100 feet = 1 inch. (From Fergusson.)

first the scenes of dramatic performances. In France and England, where the climate did not so readily admit of open-air representations, the first plays performed were exhibited in tennis or racket courts, in which there were usually galleries at one end; and as this accommodation was found too limited, these were afterwards carried along the sides also. But dramatic literature soon became so important that buildings had to be designed for the express purpose of its representation. Accordingly, in Paris, the theater of the Hôtel de Bourgogne was erected in the beginning of the 17th century. It was rebuilt 1645, with tiers of boxes on a square plan. In 1639, the theater of the Palais Royal was erected by Richelieu, and was long considered the best model. The present circular plan of the galleries, with pit sloping backwards, seems to have been first introduced in Venice in 1639; and the horse-shoe form of the boxes was first carried out by Fontana in the Tordinoni Theater at Rome, in 1675. The modern form of the auditorium was thus invented, and gradually improved and perfected, till in about a century similar theaters were erected all over Europe; the Scala Theater at Milan, the largest in Italy, and the great theater at Bordeaux, being built, the former in 1774, and the latter in 1777.

The annexed plan of the Scala Theater at Milan (fig. 2), will show the general disposition of all the parts of the modern theater on the largest scale. Modern theaters are all very similar in their general distribution. They are divided into two distinct departments—viz., the auditorium or audience department, and the stage or scenic department. In the former, the seats are invariably arranged on a sloping ground-floor or 'pit;' and on several tiers of galleries, extending in a semicircular or horse-shoe form round the house. On the ground-floor, the front rows of seats are generally set apart as 'dress stalls,' and the back part only is then called the 'pit.' In opera-houses, the stalls generally occupy the greater portion of the space, and the 'pit' is reduced to a minimum. In dramatic theaters, the tiers of galleries have the floors arranged in stages, rising above one another in such a manner as to enable the spectators all to see over those before them to the front of the stage. In theaters for operatic representation, the galleries have the floors laid level, and are divided all round into private boxes. The top tier is, however, sometimes left partially open, and has the seats on stages. In the larger opera-houses, there are usually retiring-rooms connected with

each of the private boxes. There is also a 'crush-room,' or large saloon, in which the audience may promenade between the acts.

In all French theaters and opera-houses, these saloons, or *foyers*, are very large, and elegantly fitted up. They are almost always over the entrance-hall. In some of the modern French theaters, there are two foyers, one over the other, for the different classes who occupy the dress circle and the upper galleries. The question has often been raised as to the best form for a theater, both for hearing and seeing. It is a most difficult question to decide theoretically as regards hearing, but it is quite clear that the old semicircular plan of the Greeks is as nearly as possible the best for seeing, as it places the seats all round at an equal distance from the center of the proscenium; and therefore we find, in cases where seeing well is all-important, as, for instance, in a *lecture theater*, this old form is usually adopted. In an oblong house, on the other hand, the seats at the center of the galleries are much further removed than those at the sides from the center of the stage, and are thus at a disadvantage as regards hearing; while the side boxes are badly placed for commanding a view of the stage. The entrances and staircases of theaters are not generally so well arranged or so spacious as they should be. In French theaters, this is especially the case. In these, there is often only one narrow wooden stair on each side of the house, leading to all the galleries. Recent accidents by fire, and the risk the audience runs in case of want of proper exits, have drawn attention to this subject, and the legislature will probably determine that there must be a separate, wide, and easy stair to each gallery—as, indeed, there usually now is in theaters recently built in this country. For large galleries, these stairs should be at least six feet wide; and a strong iron hand-rail down each side of the stair would be found useful in case of a panic, to prevent a fatal crush. Besides the main passages for the use of the public, there ought to be private passages and doors leading to every part of the house, so that the manager may pass with ease to any point in the audience where his presence may be required.

The orchestra occupies the space immediately in front of the proscenium, and this space is arranged so as to be capable of being enlarged or contracted as occasion may require. The proscenium is a small portion of the stage which projects a few feet in front of the curtain, so as to enable the actors to stand well forward, that they may be distinctly heard by the audience. The part of the house on either side of the proscenium is that on which there is usually the greatest amount of ornament. The

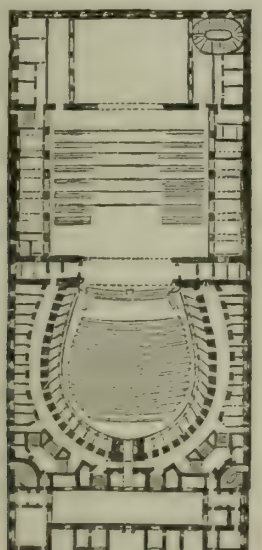

Fig. 2. —Plan of La Scala Theater at Milan—scale, 100 feet = 1 inch.
(From Fergusson.)

sides and ceiling of the proscenium form, as it were, the frame through which the picture represented on the stage is seen; and as on it every eye must rest, it is made more ornate than the rest of the auditorium. The ceiling, presenting as it does a large broad surface, and being well seen from many parts of the house, is also a place well adapted for ornament, and is generally made as handsome as possible. The same remark applies to the fronts of the dress circle and galleries. The stage extends backwards from the proscenium, and ought to be of considerable depth, so as to admit of the scenic effects, dissolving scenes, &c., now so much run upon. The great length of the stage from front to back is one of the most striking differences between the modern and the ancient theater, and arises entirely from the introduction and development of movable scenery—an invention of the architect Baldassare Peruzzi, and first used in Rome before Leo X., in 1508. The floor of the stage is not laid level like the floor of a room, but is sloped upwards from front to back, so as to elevate the performers and scenes at the back, and render them more easily seen. The inclination of the stage is generally about half an inch to every foot. The stage department of a theater not only requires to be very long, but also very lofty above, and deep below the stage, so as to allow the large frames on which the scenes are stretched to be raised or lowered in one piece.

The stage itself is a most complicated piece of mechanism, a considerable part of it being made moveable either in the form of *traps*, for raising or lowering actors, furniture, &c., or in long pieces, which slide off to each side from the center, to allow the scenes to rise or descend. There are also *bridges*, or platforms constructed for raising and lowering through similar openings, some of them the full width of the stage. The traps and bridges are almost all worked by means of balance-weights, and the slides by ropes and windlasses. Besides the large *frames* above described as containing pictures occupying the full opening of the stage, there are other scenes which are pushed from the sides to the center, each being only one half the width of the opening. These are called *flats*, and usually slide in grooves above and below. The grooves are arranged in clusters at intervals, having clear spaces between, called the *entrances*, through which the actors pass on and off the stage. But in modern French theaters and in the opera-houses—such, for instance, as Covent Garden Theater—these grooves are regarded as an encumbrance to the stage, and are entirely done away with. Their place is occupied by narrow openings or slits in the stage, below which are blocks running on wheels, and containing sockets, into which poles are dropped from above, and to these the flats are attached. Another advantage of this system is, that the gas-wings and ladders may be made movable, and slip backwards and forwards in the same manner as the flats. When occasion requires, the whole stage can thus be entirely cleared.

According to the old plan of fixed grooves, only the center of the stage can ever be cleared without unscrewing all the grooves, and the gas-wings must always remain in the same relative position. Besides the flats, there are also smaller scenes which move in the grooves. These are called *wings*, and are used to screen the entrance. Corresponding to the wings are similar narrow scenes dropped from above: these are called *borders*, and are used to hide the gas-battens. These and the scenes which are drawn up, the gas-battens, &c., are all worked by means of ropes from the *flies*, or galleries running along the sides of the stage at a high level. The ropes from these passing up into the barrel-loft (a space in the roof filled with large drums and barrels on which the ropes are coiled) and down again to the flies, form a complication which seems to the uninitiated observer an inextricable mass of confusion. While such is the usual arrangement connected with movable scenery, it is to be noted that latterly a very great change has been introduced into the higher class of theaters. This change consists in the dismissal of wings or sliding side portions of scenes with intervening gaps, and substituting for them large pieces of scenery resembling the sides and further end of a room—an arrangement every way more natural. In cases of this improved kind, the actors enter on the stage and depart by doors. In connection with the stage, it is usual to have a large space set apart for containing scenery, called the *scene-dock*.

This is frequently placed at the back of the stage, and may, on occasion, be cleared out, to give extra depth to the scene. There are also numerous apartments required in connection with the stage for the working of the theater—such as manager's room; dressing-rooms for the actors and actresses; the 'green-room,' in which they assemble when dressed, and wait till they are called; 'star-rooms,' or dressing-rooms for the stars; the wardrobe, in which the costumes are kept; furniture stores, scene stores; 'property'-maker's room; and workshops for the carpenter, gas-man, &c. There must also be a good painting-room, which must necessarily be a large apartment, from the size of the pictures which have to be painted—each being the full size of the opening of the stage. The canvas for these scenes are stretched on frames, which move up and down by means of a winch with balance-weights; and thus the painter stands comfortably on the floor, and moves his picture up or down, so as to get to any part he wishes. An interesting point on the stage is the prompt corner, from which the prompter has command of all the lights of the house, and bells to warn every man of his duty at the proper moment. He has a large brass plate, in which a number of handles are fixed, with an index to each, marking the high, low, &c., of the lights; and as each system of lights has a separate main pipe from the prompt corner, each can be managed independently. The side of the house on which the prompter is seated is called the 'prompt side,' and the other side is called the 'O. P.' or *opposite* side.

The house, or auditorium department, is generally lighted by means of a large lustre or sun-light in the center of the ceiling, and much of the effect of the building depends on how this is managed. There are also usually smaller lights round one tier of the boxes at least. The proscenium is lighted by a large lustre on each side, and by the foot-lights, which run along the whole of the front of the stage. These are sometimes provided with glasses of different colors, called mediums, which are used for throwing a red, green, or white light on the stage, as may be required. The stage is lighted by rows of gas-burners up each side and across the top at every entrance. The side-lights are called *gas-wings*, or *ladders;* and the top ones, *gas-battens*. Each of these has a main from the prompt corner. They can be pushed in and out, or up and down, like the scenery. There is also provision at each entrance for fixing flexible hose and temporary lights, so as to produce a bright effect wherever required. The mediums for producing colored light in this case are blinds of colored cloth. Another means of producing brilliant effects of light is the lime-light, by which, together with lenses of colored glass, bright lights of any color can be thrown on the stage or scenery when required.

Theaters are usually either very cold or insufferably hot. This arises from want of proper means of heating, and insufficient ventilation. The center lustre is the great cause of ventilation, the draught caused by its heat drawing off the foul air at the ceiling. The suction caused by this withdrawal of air is naturally supplied from the great body of air in the stage. The stage ought, therefore, to be moderately heated by means of hot-water pipes or otherwise, so as to prevent cold draughts. The passages and lobbies round the house should also be heated in the same way, so that any air drawn in to the house may be properly tempered.

An attempt has been made in Paris, of late years, to obviate the great heat and draught caused by the center lustre, by doing away with the lustre, and making the ceiling partly of glass, with powerful lights and reflectors behind the glass in the roof. This mode of lighting is, however, of rather a subdued character for a theater, although very appropriate to such chambers as the House of Commons, where it acts admirably. In Paris, they have also tried to supply fresh air from the gardens outside by means of a large tube, from which numerous small tubes branch. The theater built at Baireuth in 1876 for Wagner, and designed to carry out his views as to dramatic representation, has various devices for heightening the dramatic illusion; the orchestra, for example, being beneath the level of the stage, and wholly invisible to the spectators.

There is a class of theaters in Germany which have a double auditory, one at each end of the stage. One of these auditories is arranged and lighted in the usual manner, and is called the Winter Theater. The other auditory is called the Summer Theater, and is so arranged that performances may be represented in daylight during the summer season. It is lighted by large windows in the outer wall, which corresponds in form to the interior curves of the galleries, and also by windows in the roof.

The new Grand Opera of Paris, opened in 1875, is admittedly the finest theater in the world; it was built by government at a cost of upwards of 36,000.000 of francs. Its auditorium is, however, seated only for 2200 persons.

The art of *dramatic representation* has undergone great changes. In ancient Greece, partly from the character of the subjects selected, and partly from the origin of the drama itself, costume and acting were conventional, artificial, and stereotyped. On this point, we quote the words of Witzschel, who has written a Handbook for Students on the Athenian Stage (Eng. transl. by Paul; ed. by T. K. Arnold, Lond. 1850): 'There can be no doubt,' says he, 'that the somewhat fantastic costume which was handed down without any change from one generation of actors to another was closely connected with the religious character of their tragic performances. The peculiar fashion and brilliant colors of the tragic wardrobe belonged rather to the Dionysian solemnities han to the stage. That Æschylus, by whom the greater part of it was invented, kept steadily in view the original intention of tragedy, is evident from the notices which we find in ancient writers of his theatrical dresses having been worn in other religious ceremonies and processions. It is only reasonable to suppose that he would have given to the tragic stage a wardrobe of a very different description, had he not been influenced by the conviction, that theatrical performances were in some sort a religious ceremonial. Another proof of the feeling generally entertained on this subject may be found in the ridicule with which Aristophanes overwhelms Euripides for introducing his heroes, not only in pitiable situations, but in dirty, ragged, and beggarly weeds, to the great disgust of all true-hearted Athenians, and the utter annihilation of tragic ideality. In the *Acharnenses*, the whole of the tragic poet's squalid wardrobe is held up to public derision.

'The tragic costume for male characters of the highest rank consisted of an embroidered tunic with sleeves, which, in the older personages, reached to the feet (*chiton poderes*), and in the younger to the knees. Over this was thrown a green pall, or long mantle (Gr. *surma*, Lat. *palla*), which also reached to the feet, and was richly ornamented with a purple and gold border. Persons of high but not royal rank wore a shorter red mantle, embroidered with gold, which was partially covered by a richly-embroidered, high-fitting scarf. Soothsayers wore over the tunic a kind of network, composed of woollen threads. A sort of waistcoat (*kolpoma*) was also worn over the tunic. This was the costume of powerful and warlike sovereigns, such as Atreus, Agamemnon, &c. Dionysus (Bacchus) appeared in a purple tunic, which hung negligently from an embroidered shoulder-knot, and a thin, transparent, saffron-colored upper robe, with a thyrsus in his hand. Even Hercules himself was not the athletic hero of the old mythology, with a lion's skin thrown loosely round his muscular limbs, but a solemn, theatrical personage, enveloped in a long mantle. The costume of a queen was a flowing purple robe, with a white scarf; and for mourning, a black robe, and blue or dark yellow shawl. Persons in distress, especially exiles, wore dirty-white, dark-gray, dingy-yellow, or bluish garments. . . . . To increase their height, the tragic performers wore the cothurnus, a sort of buskin, with high soles and still higher heels, which compelled them to walk with a measured and sounding tread, and a top-knot of hair, or toupet (Gr. *ongkos*), suitable to the age and condition of the character represented. A corresponding breadth of figure was produced by means of padding and by a sort of glove. Thus equipped, the tragic hero seemed a giant as compared with ordinary mortals. Lastly, they had the mask, a part of the ancient theatrical costume, which seems to us so strange and unnatural. For its meaning and origin, we must go back to the Dionysian festival, at which the excited crowd were wont, in honor of the jolly god, to smear their faces with lees of wine; and at a later period, when dramatic interludes were attempted, with vermilion, or to cover their cheeks with rude masks of bark.

'In the course of time, these primitive inventions were discarded, and their place supplied by linen masks, characteristically painted. For the sake of retaining this uncouth but distinctive appendage of the Dionysian festival, the Greeks were content to forego the delicate expression of feeling and eloquent play of features which are indispensable to a modern actor; but on the other hand, when we remember the enormous size of their theaters, which scarcely permitted the assembled thousands to hear what was said by the actors, still less to distinguish their features, we are forced to acknowledge that the practice of wearing masks was rather an advantage than an inconvenience.' The above description is, in the main, applicable to the Roman as well as the Greek theaters. The only additional point which it is necessary to notice is that, among the ancients, the acting of plays was not (as it is now) a regular and daily, but only an occasional affair, at festival seasons and the like. With the fall of the Western Empire, the disappearance of classic paganism and classic tastes, and the triumph of the christianized barbarians of the north and east, theatrical performances ceased. But the liking for such things is not artificial; it is natural and irrepressible; and gradually, as the ancient culture resumed something of its former sway, efforts were made, not, indeed, to re-enact the majestic tragedy of Greece (for its language was scarcely known), or the pungent comedy of Rome, but to throw into dramatic form the 'mysteries,' 'miracles,' and 'moralities' of the Christian religion. The rudeness of these medieval plays may perhaps suggest to us what Greek performances were before the days of Thespis. In fact, they were introduced as a means of edifying, as much as of amusing the ignorant laity, were customarily the work of monks, and were performed on festive occasions in the churches. It does not, however, appear that they were accompanied by any *scenic* representations. A raised wooden stage like that which forms the front of a traveling show, was all that the untutored taste of the times demanded. Nor are we to suppose for a moment that the slightest attention was paid to propriety of costume or speech. The personages rather than the actions, the ceremony rather than the dialogue, the moral rather than the matter, were the things looked to, and hence no subtle or artistic representation of life and character was possible.

The development of the Modern Drama (q. v.) ultimately restored the art of the actor to its ancient dignity and importance; but it was long before those changes took place that gave theatrical performances their modern character. Good acting—that is to say, skilful impersonation of character and varied elocution—became quite common in England after the Restoration, and was not unknown before it; but appropriate costume and scenery were scarcely thought of until the time of Talma (q. v.), towards the close of last century. Since then, the best theaters have displayed a most creditable desire to reproduce, with something like verisimilitude, the outward 'form and pressure,' the garb, deportment, and air of the age represented.

The employment of female actors is of French origin, and

dates from the first half of the 17th c.; but they were not permitted (without molestation) to tread the English stage till 1661. Before this innovation, female parts were performed by youths; and though it ill consorts with *our* ideas of adequate representation to conceive the parts of Desdemona, Ophelia, Cordelia, &c., executed by those of another sex, it would appear that several actors obtained a wonderful success in this line.

The title of 'His Majesty's Servants,' which English actors once bore, originated in the fact that some of them were really members of the royal household. The king and particular nobles kept troops of actors for their own pleasure, whom they sometimes permitted to go about the country and perform. The first prince we read of that gave his 'servants' such permission, was Richard, Duke of Gloucester (afterwards Richard III.). In Queen Elizabeth's time (1571), the Earl of Leicester's 'servants' were licensed to open the first *public* theater in England, and it is owing to the circumstances of actors having originally formed part of the household of the king that a license from the Lord Chamberlain is still necessary to the opening of a theater.—For an anecdotical and amusing history of the English stage, see *Their Majesties' Servants*, by Dr. Doran (1865); see also Dutton Cook's *Book of the Play* (1876).

THEATERS, Laws as to. In Great Britain all theaters must be licensed, either by virtue of letters patent from Her Majesty, or by license from the Lord Chamberlain for the time being, or from justices of the peace. The Lord Chamberlain grants licenses to all theaters (not being patent theaters) within the English metropolis, and within the places where Her Majesty occasionally resides, except New Windsor and Brighton. For every license of the Lord Chamberlain, a fee not exceeding 10*s.* per month is charged. In other parts of Great Britain, the justices of the peace of the county, city, or borough must be applied to for a license; and after the usual notice, they hold a special session, for the purpose of granting licenses to theaters, the fee payable being a sum not exceeding 5*s.* per month. It is only to the actual and responsible manager of the theater that a license can be granted, and his name and place of abode must be printed on every play-bill. The manager must find sureties to observe the rules issued by the Lord Chamberlain and justices, which rules relate to the days and hours of keeping open, and the insuring of order and decency. A penalty of £10 is imposed, by statute 6 and 7 Vict. c. 68, on any actor or manager concerned in unlicensed places.

A copy of every new play, epilogue, or prologue, or alteration of the same, intended to be produced at any theater in Great Britain, must be sent to the Lord Chamberlain, by the manager, seven days before such production; and for examination of such plays and alterations of plays, he may charge fees not exceeding ten guineas, according to a scale fixed by him. He may forbid the acting of any play, whenever he considers it to be fitting to the preservation of good manners, decorum, or the public peace, to do so. To act a play not allowed or disallowed, subjects each actor and manager to a penalty of £50. It has been decided by the courts, that a booth used as a temporary or portable theater requires a license, and that any dialogue or dramatic performance by two persons is a stage-play, and therefore subject to the license. Of late, the policy of placing the theaters so entirely under the control of the Lord Chamberlain and justices has been disputed, especially as the increasing practice of introducing theatrical performances at public supper-rooms has led to some vexatious prosecutions at the instance of the licensees of regular theaters.

THE'ATINES, one of the more modern religious brotherhoods of the Roman Catholic Church, which played a very important part in the well-known internal movement for reformation which took place in central and southern Italy towards the middle of the 16th c., and which Ranke has described in his *History of the Popes*. The founders of this association were a party of friends: Cajetan di Thiene; John Peter Caraffa, at that time Bishop of *Theate* (from which the Congregation took the name *Theatine*); Paul Consiglieri; and Bonifazio di Colle. Cajetan and Caraffa, in concert with the two other friends named above, having resigned all their preferments, obtained a brief of Clement, dated June 25, 1524, formally constituting the new brotherhood, with the three usual vows, and with the privilege of electing their superior, who was to hold office for three years. One peculiarity of their vow of poverty deserves special notice: they were forbidden to possess property, and were to subsist entirely upon the alms of the faithful; and yet they were strictly forbidden to beg, or in any way to solicit charitable contributions. Their first convent was opened in Rome, and F. Caraffa was chosen as the first superior. He was succeeded in 1527 by Cajetan, and the Congregation began to extend to the provinces. After a time, however, it was thought advisable to unite it with the somewhat analogous order of the Somaschans; but this union was not of long continuance; Caraffa, who was elected pope, under the name of Paul IV., having restored the original constitution in 1555. By degrees, the T. extended themselves, first over Italy, and afterwards into Spain, Poland, and Germany, especially Bavaria. They did not find an entrance into France till the following century, when a House was founded in Paris under Cardinal Mazarin in 1644. To their activity, devotedness, and zeal, Ranke ascribes much of the success of that remarkable reaction against Protestantism which took place in the latter half of the 16th century. In later times, however, they do not appear to have played any notable part. Their most remarkable member in modern times has been the celebrated Sicilian, Father Ventura, author of the well-known work *Bellezze della Fede*, and familiar to Englishmen by the part which he took in the Italian revolution of 1849. At present, the Theatine order is confined to Italy and Sicily.

THE'BAINE. See Opium.

THEBES, the name of a celebrated Egyptian city, called by the Egyptians Taape, or Taouab; by the Hebrews, No-Amen; by the Greeks, Thebæ; and at a later period, Diospolis Magna. It lies in the broadest section of the valley of the Nile, in about lat. 26° N., and was formerly the capital of Southern or Upper Egypt. Its ruins, the most extensive in that country, comprise nine townships, the most remarkable of which are Medinat Habu, Gournah, Karnak, and Luxor. Its local and eponymous god was Amen-Ra, or Jupiter Ammon; and its foundation traditionally dated from the time of Menes, the founder of the monarchy, although no remains of so early a date have been discovered on the site. Recently, however, excavations have brought to light constructions of the 11th dynasty, who appear to have founded the original temple of the god. The Nile flows through the midst of the ancient city, and divides it into four principal quarters: Karnak and Luxor, which lie on the east bank, and Gournah and Medinat Habu, on the west bank of the river. The most flourishing period of the city was under the 18th, 19th, and 20th dynasties, or from about 1500 to 1000 B.C., when it had supplanted Memphis, the ancient capital of the Pharaohs. The more central situation of this city probably caused it to rise into importance, for it was secure against the northern enemies of Egypt; hence, under these Diospolitan dynasties, the worship of Amen-Ra arose in all its splendor; magnificent palaces and temples were built in its different quarters, to which additions were made by later monarchs, and even by the Ptolemies and Romans till the time of the Antonines, in the 2d c. A.D. Here, too, were the cemeteries of the Theban monarchs and the officers of their courts, colleges of priests, and the seat of royal government. It was enriched by the spoils of Asia and the tributes of Ethiopia, and its fame and reputation had reached the early Greeks, Homer describing it by the epithet of Hekatompylos, or City of a Hundred Gates, in allusion to its propylæa, for T. was never a fortified city. In the plentitude of its power, it sent forth an army of 20,000 war-chariots; but the Bubastite and Tanite dynasties removed the capital again to Sais and Memphis, and T. declined in importance, although retaining much of its ancient grandeur.

At the Persian conquest, Cambyses obtained a spoil of nearly £2,000,000 from the city, destroyed many of its noblest monuments, and injured its political pre-eminence. The foundation of Alexandria still further injured the city; and at the time of Strabo, T. was only a cluster of small villages; its extent being about 9½ miles in length (according to Diodorus), and its circuit about 16 miles. Its temples, tombs, and ruins were visited by Roman travelers, including Hadrian. At a later period, a considerable Christian population existed under the empire; but the inhabitants fled at the Arab invasion to Esneh; and T. is now inhabited only by a few Arab families of Fellaheen, who obtain a precarious livelihood by guiding travelers over the ruins, or rifling the tombs for antiquities. At Gournah, is to be seen the Memnoneion, built by Ramesses II.; with a colossus of that monarch, weighing 887½ tons, the largest statue in Egypt, broken. This is supposed to be the palace of Osymandyas, described by Hecataeus, and is of considerable extent. In this quarter are two palace-temples of Amenophis III., and the vocal Memnon, or celebrated colossus of that monarch, supposed by the ancients to emit a sound at sunrise. At Medinat Habu is a pile of buildings, commenced by Thothmes I., of the 18th dynasty, with courts and propylæa, built by Ramesses III. or Rhampsinitus, and sculptures representing his victories over the Philistines, the life in his harem, the riches of his treasury, and a calendar with inscriptions dated in the twelfth year of his reign. Here, 8000 feet to the north-west, are the cemeteries of sacred apes; and 3000 feet beyond, the valley of the Tombs of the Queens, consisting of 17 *syringes*, or sepulchres, supposed to be the tombs of the Pallacides of Amen, mentioned by Diodorus and Strabo. Near them are the Biban-el-Meluk, or tombs of the monarchs of the 19th and 20th dynasties, 16 in number, the most interesting of which are that of Sethos I., called Belzoni's, after its discoverer, and those of Ramesses III. and Siptah.

At Gournah itself are the tombs of functionaries and others, and this latter site has enriched the museums of Europe with antiquities of various kinds. The palaces of the Luxor quarter were founded by Amenophis III. From hence was removed the

obelisk of the Place de la Concorde in Paris. Still more magnificent than any of these is the temple of Karnak, the sanctuary of which, built by Osertesen I. of the 12th dynasty, was added to by the monarchs of the 18th dynasty. The most remarkable part of this wonderful mass of courts, propylæa, and obelisks, is the great hall, 170 feet by 329 feet, built by Sethos I. and Ramesses II., having a central avenue of 12 massive columns, 60 feet high, 12 feet in diameter; 122 other lofty columns, and 2 obelisks, 92 feet high. Here is the so-called Portico of the Bubastites, built by Shishak I., recording his expedition against Jerusalem, 971 B.C. An important discovery was made in 1881 in a rock-cut gallery in cliffs 4 miles east of T., including 39 mummies of royal and priestly persons, five perfect papyri, and thousands of mortuary statues and other objects. They may have been hidden here by the priests in the invasion by Cambyses. The mummies belong to personages from the 17th to the 21st dynasties, and amongst them are those of Thothmes III., who erected the obelisk now on the Thames Embankment, and Ramesses II. (q. v.).

THEBES, the principal city of Bœotia, in ancient Greece, was situated in the southern part of the country, on the slopes of Mount Teumessus, and between two streams, the Dirce and the Ismenus. According to the prevalent tradition, T. was founded by a colony of Phœnicians under Cadmus (q. v.), after whom the city was called Cadmeia—a name subsequently restricted to the citadel; but passing over the long series of picturesque and tragic myths that have given it its pre-historic fame (in which the central figure is (Œdipus), we first catch a quasi-authentic glimpse of Theban history in the 8th c. B.C., when one Philolaus, a Corinthian, settled in the place, and drew up a code of laws for the inhabitants.

It is not till near the end of the 6th c. B.C., however, that we reach a purely historical period—the earliest well-attested event being the dispute between T. and another Bœotian city, Platææ, which involved the former city in an unsuccessful war with Athens. Henceforth, the relations of T. and Athens were, except for brief intervals, marked by bitter enmity. During the Persian war, T. shamefully sided with the Asiatic invader, and, in consequence, lost much of her power and prestige. Athens proposed to deprive her of her supremacy over the Bœotian confederacy; but Sparta, always jealous, even to spitefulness, of her Attic rival, interfered, and positively forced the other Bœotian cities to acknowledge anew their unworthy mistress. When the Peloponnesian war broke out, T. took part with Sparta, and at its close, was eager for the destruction of Athens; but soon after, it became jealous of the overgrown power of its ally, and gave a friendly welcome and shelter to those Athenians whom the oppression of the Thirty Tyrants (q. v.) compelled to abandon their city. It was from T. that Thrasybulus and his copatriots started on their famous expedition for the deliverence of Athens, accompanied by a body of Theban citizens. A keen and bitter antagonism now sprung up between T. and Sparta, which after many vicissitudes, ended in a great military struggle (379—362 B.C.), in which the former city, under the heroic guidance of Epaminondas (q. v.), achieved a brilliant triumph, and for a time held the position of the foremost power in Greece. It was now the time for Athens to revive her ancient animosities; and for a while they had free play. At length, the eloquence of Demosthenes induced both states to unite in opposition to the encroachments of Philip of Macedon; but it was too late; and in 338 B.C., the battle of Chæroneia crushed the liberties of Greece. After Philip's death, the Thebans made a fierce but unsuccessful effort to regain their freedom. Their city was taken by Alexander, who leveled it to the ground, and sold the entire population—men, women, and children—into slavery. For 20 years it remained an utter desolation; but in 315 B.C., it was rebuilt by Cassander, who gathered into it all the Thebans he could find in Greece. It was again destroyed by the Romans, and did not recover till about the decline of the empire. During the 11th and 12 centuries, it was the seat of a considerable population, engaged in the manufacture of silk; but under the Turks it again declined, though it has still a modern representative, Thebes, or Thiva, with a pop. of 4000. Scarcely a single relic of antiquity has survived the ravages of time.

THE'CLA, a virgin saint of the early church, whose existence may be considered historical, although all, or almost all, the details regarding her are legendary. According to the legend, T. was a member of a noble family of Iconium in Lycaonia, where she was converted by the preaching of St. Paul, and having devoted herself to a life of virginity, suffered a series of persecutions from her intended bridegroom, as well as from her parents. She is styled in the Greek martyrologies the *proto-martyress*, as Stephen is the proto-martyr; while in the Roman Breviary, she is said to have died at the age of 90 in Seleucia. The apocryphal *Acts of Paul and Thecla* were edited by Tischendorf.

THEFT. See LARCENY.

THE'INE. See CAFFEINE and TEA.

THEISM is a system of belief that acknowledges the existence of God; and the term, as ordinarily used, implies recognition of the personality of God, the one God being worshiped as Creator, Preserver, and Governor. Theism is therefore not merely opposed to Atheism, but to Polytheism and Pantheism; as also to Materialism, Secularism, Positivism, and Agnosticism. (See the articles, RELIGION, GOD, PANTHEISM, MATERIALISM, SECULARISM, AGNOSTICISM; also POSITIVISM.) Further, though from its etymology it might be assumed to signify the same as Deism (Theism being from the Greek *Theos*, God; and Deism from the Latin *Deus*), Deism is ordinarily understood to signify a system which, while admitting the belief in God, denies the Trinity and Supernatural Revelation; while in Theistic systems, the emphasis is thrown on what is affirmed, not on what is denied. Christianity is accordingly ranked as a Theistic system; the other great Theistic churches being Judaism and Mohammedanism. Many of the separatists from orthodox Christianity are theists; as the Unitarians (q. v.), and the Brahmo Somaj (q. v.) of India. Some of these latter of course deny most that the Deists denied, though they lay more stress on the positive aspects of their religion than on their differences from orthodox belief. The philosophy of the younger Fichte (q. v.), and of some other modern German philosophers, is distinctively known as *Theistic* or as *Ethical Theism*.

THEISS, an important affluent of the Danube, and the chief river of Hungary, rises by two streams, the Black T. and the White T., in the Carpathian Mountains. It flows north-west, south-west, and finally southward, joining the Danube, after running parallel to it for 300 miles. The T. has several large and navigable affluents, as the Maros and Bodrog. The lower part of its course is sluggish, and it has often inundated the plains, flooding the cities on its banks, such as Szegedin (overwhelmed in 1879). The T. is extraordinarily rich in fish, and has been described as 'two-thirds water and one-third fish.' Its entire length, including windings, is 828 miles.

THELLUSSON ACT is an act of parliament, 39 and 40 Geo. III. c. 98, passed for the purpose of checking the disposition of testators to accumulate the income of their estates until it should form a large fortune. The late Mr. Thellusson had, by his will, directed his personal property to be invested in land, and the rents and profits of the land to be so purchased, and of his other real estate, to be accumulated during the lives of all his descendants who should be living at the time of his death, or born in a certain time thereafter; and then he limited the accumulated property in favor of certain of his descendants who might be then living at that distant time. The property was said to have consisted of landed estates worth £4000 a year, besides personalty of about half a million; and it was estimated that the accumulated fund would amount to above 19 millions. The testators's object was to create enormous wealth, for the purpose of founding three families to spring from his three sons. For three-quarters of a century, the questions arising out of this will have been discussed in various forms; but the legislature, soon after the testator's death, took the earliest opportunity of preventing in future testators accumulating the income in this way for more than 21 years, and the above act was passed for that purpose. Ultimately, the fund was distributed among a greater number of claimants. The litigation ended by a decree of the House of Lords in 1858.

THE'MIS, in Greek Mythology, was the daughter of Uranus and Gē, the wife of Zeus, and, by him, mother of the Horæ (Hours) and Mœræ (Fates), as also of Eunomia (Equity), Dikē (Justice), and Eirēnē (Peace). She was regarded as the personification of order and justice, or of whatever is established by 'use and wont;' and as such was charged by Zeus to convoke the gods, and preside over them when assembled, being likewise represented as reigning in the assemblies of men. In modern art, T. is represented as having her eyes bandaged, and at the same time holding a pair of evenly-balanced scales in one hand, with a sword in the other.

THEMI'STOCLES, the great Athenian general and statesman, was the son of an obscure citizen of Athens, and was born about 514 B.C. He was actuated by excessive ambition from a very early period, and began his public career by setting himself in opposition to the principal men of the state, and chiefly Aristides, 'the Just.' It is uncertain whether he was at Marathon, but there is no doubt that the laurels gained there by Miltiades fired T.'s ambition. From the time (483) that he got his inconveniently upright rival, Aristides (q. v.), ostracised, he was regarded as the political leader in Athens, being made Archon Eponymus in 481. In order to recover for Athens the naval supremacy in Greece, and that she might be prepared to meet the expected Persian invasion, he persuaded the Athenians to devote the proceeds arising from the silver mines at Laurium to the construction of a fleet, sagaciously foreseeing that his country's only chance of overcoming her enemy was by sea. In the battles of Artemisium and Salamis (480), disastrous for the Persians, T.,

commander of the Athenian fleet, the largest in Greece, to avoid dissensions, was content to serve under Eurybiades the Spartan. On both these occasions, it was only by the greatest tact, combined with threats and a judicious outlay of the bribes which he himself had received in profusion, that T. could induce the other commanders to come to an engagement with the Persians.

On the night previous to Salamis, he sent a faithful slave to tell Xerxes that unless he came up next day, the Greek fleet would be scattered, and he would miss the chance of an engagement; thus securing either victory to the Greeks, or the favor of Xerxes to himself in case of defeat. See SALAMIS. In several other ways did the wily T. contrive to provide for himself a safe retreat at the Persian court in case of disaster. The victory at Salamis raised his reputation to the highest point. Not neglecting his own personal aggrandizement, he sailed round among the Grecian islands, and on various pretexts, extorted enormous sums from the inhabitants. Shortly after the Persian invasion, his fellow-citizens began to see through him, and he was accused of bribery and extortion. In 471, he was ostracised, and retired to Argos; and finally, to escape being tried for treason, in which he was implicated by the correspondence of Pausanias, he betook himself, in 465, to the court of Artaxerxes, king of Persia; but before he would see the king himself, got permission to wait a year, during which he made himself master of the language and usages of Persia. At the end of this time, he managed to raise himself so highly in the king's favor, that, after the Persian fashion, the town of Magnesia was appointed to supply him with bread, Lampsacus with wine, and Myus with other provisions. He lived securely at Magnesia until his death in 449. Some authorities assert that he poisoned himself. A monument was erected to T. in the market-place of Magnesia, and it is said that his bones were secretly taken to Attica, and burned there. Undoubtedly T. was a man of very great sagacity and determination, had a quick and keen perception of difficulties both present and future, which his ready invention, backed by promptness of action, enabled him to meet and overcome. On the other hand, he appears to have been possessed of no moral principles, his greatest ambition apparently having been to make himself, by fair means or foul, the greatest man in Greece.

THE'NARD'S BLUE. See BLUE.

THEOBALD, LEWIS, was the son of an attorney at Sittingbourne in Kent, at which place he was born towards the close of the 17th century. His father's business, for which he was educated, proved not much to his mind; and betaking himself to literature, he published, in 1714, a tragedy entitled *Electra*, which he followed up by a number of other dramas. As a poet, he had scant success, and is long since utterly forgotten; but as the favorite butt of Pope, he is immortalized in the *Dunciad* of that writer. Besides this unenviable distinction, 'piddling Theobald,' as Pope contemptuously termed him, is not without some fair claim to be honorably remembered as one of the most laborious and useful of the early editors and commentators on Shakspeare. In this capacity, dull as he undoubtedly was, he did good service to the poet, which has since been sufficiently recognized. The hatred of Pope he incurred by a pamphlet published in 1726, entitled *Shakspeare Restored, or Specimens of Blunders committed or unamended in Pope's Edition of this Poet;* and if he could not compete with his adversary in wit, he proved himself a much more competent editor of Shakspeare, by his edition in 7 volumes 8vo, published in 1733, which quite extinguished that of his rival. His knowledge of our earlier drama was extensive and minute; and to his judicious application of it, in elucidating the text of the great poet, we remain to this hour not a little indebted. He died in September 1744.

THEOBRO'MINE ($C_{14}H_8N_4O_4$) is a crystallizable principle present in chocolate. It is extracted from the cacoa-nuts (the seeds of *Theobroma cacao*) in the same manner as caffeine or theine is extracted from the coffee, tea, &c., in which that substance occurs. It is less soluble in water than caffeine, but resembles that substance in forming crystallizable salts with some of the acids. By dissolving theobromine in a solution of ammonia, and adding nitrate of silver, a gelatinous precipitate is obtained, which, by boiling with a solution of ammonia, yields a crystalline mass of theobromide of silver ($C_{14}H_7AgN_4O_4$) in which 1 equivalent of hydrogen is replaced by 1 of silver. This compound, when treated with iodide of methyl, yields iodide of silver and caffeine, which latter may be extracted with alcohol. Hence we arrive at the remarkable conclusion, that caffeine ($C_{16}H_{10}N_4O_4$) must be regarded as methyl-theobromine, $C_{14}H_7(C_2H_3)N_4O_4$.

THEO'CRACY, literally, 'government by God,' is the name given to that constitution of a state in which the Almighty is regarded as the sole sovereign, and the laws of the realm as divine commands rather than human ordinances. Under such a view, the priesthood necessarily become the promulgators and interpreters of the 'divine commands,' and act as the officers of the invisible Ruler. The most famous example of a theocracy is that established by Moses among the Hebrews.

THEO'CRITUS, the creator and most celebrated composer of bucolic poetry, was the son of Praxagoras and Philinna, and born at Syracuse. The date of his birth is unknown, but the period of his greatest literary activity was probably 272 B.C. About the close of the reign of Ptolemy Soter, he visited Alexandria, where he received instruction, and made his first successful essays in poetry. He came to be patronized by Ptolemy Philadelphus, who assisted his father, Ptolemy Soter, in the government of Egypt, and in honor of his patron, he composed, about 285 B.C., his 14th, 15th, and 17th idyls. He further formed the acquaintance of the poet Aratus, to whom he addressed his 6th idyl. He subsequently revisited Syracuse, where he continued to reside under Hiero II. From his 16th idyl it may be concluded that he was dissatisfied with the political state of Sicily, and also with the insufficient rewards which his poems received from Hiero; and that, in consequence, he fixed his attention, during his declining years, rather on the life of the country than of the court, and on those scenes of rural nature which form the chief subject of his poetical remains. The idyls of T. are principally representations, dramatic and mimetic in their character, of the every day life of the Sicilian peasantry. They have been successfully imitated by Virgil and have given origin at least to that so-called pastoral literature of medieval and modern times, which is, however, totally deficient in the simplicity, fidelity, and therefore poetry of the Syracusan author.

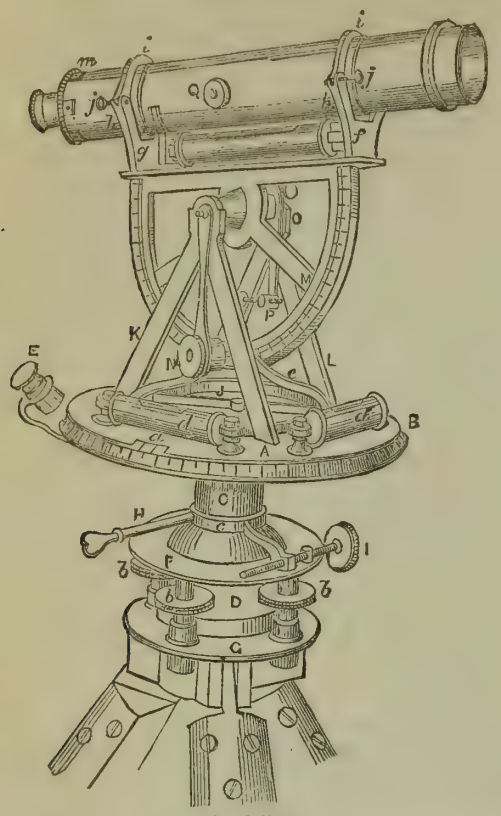
T. knows nothing of the imaginary shepherds of a fictitious Arcadia; his dramatic simplicity and truth are in wide contrast to the affected sentiment, the unnatural innocence, and the artifical simplicity of that unreal world. Comedy and pathos enter freely into his representations of rural Sicilian life, and his idyls retain the charms of freshness and nature even to the present day. They are 30 in number, though all of them are not strictly bucolic, or even genuine. They are written in a mixed dialect, in which the softened Doric prevails; and together with a few lines from a lost poem called *Berenice*, and 22 epigrams in the Greek Anthology, make up his remains, of which the best editions are those of Meineke and Paley; and the best translation in English, that of Dr. M. J. Chapman.

THEO'DICY (Gr. *Theos*, God, and *diké*, justice; Lat. *Theodicæa*, the judgment of God), a name given to the exposition of the theory of Divine Providence, with a view especially to the vindication of the attributes and particularly of the sanctity and justice of God in establishing the present order of things, in which evil, moral as well as physical, so largely appears to prevail. The name is of modern origin, dating from the close of the 17th c., or the beginning of the 18th c.; but the theory itself, as well as the mysterious problem which it is meant to resolve, is as old as philosophy itself. See EVIL. The first to consider the question in its integrity was the celebrated Leibnitz (q. v.). His work entitled *Essais de Theodicée sur la Bonté de Dieu la Liberté de l'Homme et l'Origine du Mal*, was published in 1710. It rose at once to the very highest point of popularity, and was translated into almost every European language. The leading principle of Leibnitz's vindication of God's goodness is the well-known optimistic theory which has been explained elsewhere (see OPTIMISM); but he has been followed by several writers in different countries—as Balguy, Werdermann, Kindervater, Crentzer, Benedict Kapp, and many others.

Of these writers, it may be said in general, that they have followed the same method, and have addressed themselves to the same view—viz., the reconciliation with the goodness, the sanctity, and the justice of the one God, the existence of those manifold evils, physical or material, as well as moral, which appear in the present order of things. This view, it will be seen, is strictly limited to one single problem. But in the discussions of the new philosophic systems, and especially that of Hegel, which have arisen in Germany, new difficulties regarding the Christian idea of God have arisen out of the rationalistic notions of existence in general. To meet those difficulties, a new theodicy has become necessary, and it has begun to occupy the attention of philosophers, especially in France. Two works in particular addressed to this view of the subject may be noticed: the first is M. Maret's *Christian Theodicée, or Comparison of the Christian and the Rationalistic idea of God*, 1845; the second is that of the Jesuit philosopher Père Gratry, who has devoted the first volume of his course of philosophy, *De la Connaissance de Dieu*, to this special subject. This work was published at Paris, 1853.

THEO'DOLITE (Gr. *theao*, I see, *dolichos*, long), an instrument much employed in land-surveying for the measurement of angles horizontal and vertical, is neither more or less than an altitude and azimuth instrument, proportioned and constructed so as to be conveniently portable. Like all instruments in very general use, the variations in its construction are almost numberless; but its main characteristics continue unaltered in all forms. It consists essentially of two concentric circular plates of copper, brass, or

other material (the upper plate, or *upper horizontal*, either being smaller, and let into the lower, or *lower horizontal*, or the rim of the lower raised round the outside of the upper), moving round a common axis, which, being double, admits of one plate moving independently of the other. Upon the upper horizontal rise two supports, bearing a cross bar, which is the axis of a *vertical circle* moving in a plane at right angles to the former. This latter circle



Theodolite:

A, B, the horizontal limbs; *a*, the vernier plate, which turns; C, the vertical axis; D, the ball or socket movement; *d*, *d*, spirit levels; E, a magnifier to read off the degrees; F, G, Plates held together by the ball D; *f*, a screw to adjust the level or line of collimation; *b*, *b*, *b*, milled screws to adjust the instrument, and set in level; *g*, a screw to adjust the telescope laterally; H, a clamping screw, by which means the collar *c* may be tightened to the axis C, and kept from moving; J, the magnet box; I, a slow-motion screw, by which the instrument is moved more exactly than could be done by the hand; *i*, *i*, clips, to reverse the telescope by screws. *j*, *j*; K, L, frames into which the pivots are placed, on which the vertical arc M is turned round, and on which the telescope is fixed; N, a microscope for reading off the degrees; O, a clamp screw; P, a slow-motion screw, by which the vertical arc and telescope are moved; Q, a milled screw for moving the object-glass of the telescope.—From Cresy's *Encyclopædia of Civil Engineering*.

either has a telescope fixed concentric with itself, or a semicircle is substituted for the circle, and the telescope is laid above, and parallel to its diameter. The circles, as their names denote, are employed in the measurement of horizontal and vertical angles. For these purposes, the outer of the horizontal circles is graduated, and the inner carries the index-point and the Verniers (q. v.); the vertical circle is also graduated, and the graduations are generally read off by an index-point and vernier firmly attached to the supports. The upper horizontal is furnished with two levels placed at right angles to each other for purposes of adjustment, and has a compass-box let into it at its center. The stand consists of a circular plate supported on three legs, and connected with the lower horizontal by means of a ball-and-socket joint; the horizontal adjustment of the instrument being effected by means of three or four (the latter number is the better) upright screws placed at equal distances between the plates.

The telescope is so fixed as to be reversible, and the adjustments are in great part similar to those of other telescopic instruments, but are too numerous and minute to be here detailed. Both horizontal plates being made, by means of the screws and levels, truly level, the telescope is pointed at one object, and the horizontal angles read off; it is then turned to another object and the readings-off from the graduated circle again performed; and by the difference of the readings, the angular horizontal deviation is given; and when vertical angles are required, the readings are taken from the vertical circle in a similar manner.

THEODORE, of Mopsuestia, a well-known writer of the Syrian Church, and especially notable in connection with the controversy of 'The Three Chapters,' was born of a wealthy and distinguished family at Antioch, in the first half of the 4th century. He was the school-fellow and friend of St. John Chrysostom, and his fellow-pupil under the philosopher and rhetorician Libanius; and he was induced, by the earnest exhortation of Chrysostom, to join with him in embracing the monastic life. His theological and scriptural studies were made under Flavian of Antioch and Diodorus of Tarsus; and having received priest's orders, he resided for a time at Antioch, where his learning and eloquence won the highest applause; and afterwards at Tarsus, under his old teacher Diodorus. About the year 390, or a little later, he was chosen Bishop of Mopsuestia in Cilicia. In 394, he preached in the presence of the Emperor Theodosius at Constantinople, on occasion of a synod held in that city. Of his further history, little is known; but his literary activity must have been prodigious, if we can judge by the contemporary accounts, and by the number of the works which are ascribed to him, but of which only fragments now remain. The most important of these consisted of commentaries on almost all the books of Scripture, and various polemical writings. A supposed tendency to Pelagian and Nestorian errors was observable in T., and was in part the occasion of the long controversy of the Three Chapters. This controversy, however, did not arise till long after the death of T., which took place about 427. Considerable fragments of T.'s commentaries have been published by Cardinal Mai in his *Spicilegium Romanum*, and some of his works still exist in Syriac; but by far the greater proportion has been lost.

THEODORE, king of Abyssinia, otherwise described as Negus or King of Kings of Abyssinia, was the nephew of a chief in Amhara, the central province—the others being (see ABYSSINIA) Tigré, in the north, and Shoa. His mother, left a widow in poverty, maintained herself by selling in Gondar a drug *kosso*, used as a specific against tapeworm. Her son, originally called Kassai, was born in 1820. He became distinguished as a soldier fighting against the Turks, and took advantage of a quarrel amongst his uncle's sons to wrest the chieftainship from them. He defeated Ras Ali, the powerful ruler of Amhara; obtained possession of the person of the titular emperor Johannes; and annexed Tigré. Securing the favor of the Coptic Church by banishing Roman Catholic missionaries, he was crowned as Theodore of Abyssinia in 1855. Through his mother, he professed to derive descent from King Solomon—a circumstance much in his favor. Nothing was left to conquer but Shoa, which was presently accomplished, and T. was really actual monarch of the country, though he still showed outward reverence to the titular king of the old family. He resolved to extend his dominions to the Red Sea, and to enter on a crusade with the Turks for the recovery of the seaboard, once Abyssinian. He had treated the conquered districts with great leniency, generally leaving one of the ruling family in power. He showed much favor to Messrs. Bell and Plowden, Englishmen who had established themselves in Amhara in the days of Ras Ali; and Mr. Plowden was still recognized as consul. T. heartily adopted many of their schemes, and was anxious to open up intercourse with England. But he was difficult to negotiate with; holding that he had the same claim to respect as a European monarch. He was kept in torture by imaginary slights, and especially by the respect shown to the Turks, whom he regarded as barbarians. But he permitted the founding of three Protestant missions, one under Mr. Krapf (under the auspices of Bishop Gobat of Jerusalem), one under Messrs. Stern and Rosenthal, and a Scottish mission. He soon quarreled with English diplomacy, being irritated by our refusal to receive an embassy without his assurance that he would renounce all idea of reconquering any territory from Egypt. Mr. Plowden was killed by a rebel chief, and a new consul, Mr. Cameron, was appointed without consulting T. In 1862, the Egyptians were advancing within T.'s frontiers.

T. resolved to appeal to the English and French governments, and wrote letters claiming their protection. That to the Queen was forwarded to Aden, but unfortunately did not reach London until February 1863, when it was thrust into a pigeon-hole, and ignored or forgotten. In the meanwhile, Consul Cameron was directed to visit Sennaar, on the frontier of Egypt and Abyssinia, to judge of its fitness to become a cotton-producing country. The object of this journey was not explained to T., and he naturally believed it to be a visit by a spy to his enemies the Turks. His suspicions were not allayed when the consul, on his return to Gondar, could produce no answer to the letter. He had received a dispatch, but it simply ordered him to go back to Massowah, and not to interfere with Abyssinian politics. 'So your queen,' said T., 'can give you orders to return to Massowah, but she cannot send a civil answer to my letter to her. You shall not leave till that answer comes;' and the consul was detained on parole at Gondar. In reply to the French letter, M. Lejean was sent to Abyssinia. A written answer to T. was read, in which, as if it

had been intended to irritate him, something was said of the protection accorded by the Emperor of the French to all Roman Catholics in the East. This aggravated the offence already committed by the French—that of aiding the prince of Tigré. The letter was torn and trampled upon, and M. Lejean, imprisoned for a few days, was ordered off to Massowah. T. declared he would no longer be 'humbugged by missionaries and consuls like a rajah of Hindastan,' and the European residents all felt that a crisis had come.

In October 1863, Consul Cameron sent letters to Massowah. His messengers were stopped, deprived of their dispatches, and beaten. On the same day, Mr. Stern, who happened to pay a visit of ceremony to the emperor, inadvertently gave him offence; and he and his two servants were ordered to be beaten. The servants died the same night. Mr. Stern himself was so seriously hurt that his life was despaired of. His papers were then examined, and found to contain remarks derogatory to the emperor. He and Mr. Rosenthal were arrested, and on the 20th of November, they were publicly tried with all the formalities of Abyssinian law—on a charge of having committed the *crimen læsæ majestatis*. Mr. Stern was accused of having circulated the report in Europe of T. being the son of a beggar-woman who sold kosso, and of his not being the descendant of Solomon and the queen of Sheba; while Mr. Rosenthal was accused of having said that the country would fare better under the Turks than Theodore. The prisoners were condemned to death, but the sentence was not carried out. Two days after the trial, dispatches arrived for Captain Cameron, but there was no reply to T.'s letter. Under these circumstances, the consul was injudicious enough to apply for permission to leave. He was arrested and thrown into the prison at Gondar with the missionaries, where they remained till the following summer, when they were removed to Magdala. The English government did not seem to interest themselves about the consul; but the case of the missionaries was warmly taken up by Lord Shaftesbury and the religious public. A letter of Captain Cameron's was published, in which he said: 'No release until an answer is sent to the letter to the Queen.' The subject was brought before parliament, and the government were compelled to search for this document. It was found in the pigeon-hole where it had been put, endorsed by Lord John Russell. It had been written in 1862; it was answered in June 1864. The reply was intrusted to Mr. Hormuzd Rassam, a native of Mosul, who had been employed in diplomatic service at Aden.

The choice of his envoy was most unfortunate—he being, in the eyes of Theodore, a mere Turk, and therefore a spy and an enemy. He was not received till January 1866, and then a second error was committed. Mr. Rassam accepted a large present from T., and did not, or was not enabled to repay it, as was expected, by a gift equal in value, although the necessity of doing so had been fully explained to the government. T. then sent the English envoy, who was treated as a mere beggar, to prison with the other captives. This was his first distinct breach of the law of nations. After this period, he conducted himself like a madman: he caused women and children to be tortured, dishonored, and starved in an unheard-of manner. 'Out of 3,000,000 inhabitants,' says Dr. Blanc in June 1867, 'he has destroyed more than a third by war, famine, and murder.' After some unsuccessful attempts to negotiate with T., through Mr. Flad, in the early part of 1867, Lord Stanley, in April, ordered him within three months to deliver up the prisoners. He took no notice of the communication, and accordingly an expedition was fitted out at Bombay for the invasion of the table-land. The force consisted of upwards of 10,000 soldiers. Early in November the advanced brigade landed at Zulla, on the Red Sea. From this point, the expedition advanced successfully in spite of many difficulties, and, in the beginning of April 1868, came within sight of Magdala. On the 10th of April, near Magdala, T. gave battle to the British forces, and sustained a defeat so decided that he forthwith made submission to the extent of surrendering all the European captives in his power; and on the 13th, Magdala, into which he had retired, was stormed, and with little difficulty was taken possession of by our forces. Neither in the battle nor the assault was there any loss of life on the British side, only a few being wounded; the Abyssinians sustained a loss of 500 killed and 1500 wounded, the most notable among the former being T. himself, who was found dead, shot in the head.—See *The British Captives in Abyssinia*, and other works, by C. T. Beke, Ph.D.; the government blue-books; an article in No. 65 of the *Westminster Review*, New Series; the works of Harris, Rudolph, Lejean, and Dufton.

THEODORE'TUS (Gr. *Theodoretos*, God-bestowed), a celebrated church historian and theological writer, was born at Antioch, about the year 393, and received his name from the circumstance of his being supposed to have been granted as the fruit of earnest prayer, to his parents, who had long been childless. He was educated from early childhood in a monastery, where, among his fellow-pupils, were Nestorius and John of Antioch, both afterwards celebrated in the controversy which takes its name from the former. He was admitted among the clergy of Antioch; and at a comparatively early age became Bishop of Cyrus, a city of Syria. His zeal and eloquence were the theme of universal praise, and his success in bringing unbelievers and heretics to the church was almost unprecedented. In the controversies on the subject of Nestorius and his doctrines, which followed the condemnation pronounced by the council of Ephesus in 431, T. for a time took a warm and active interest. The party of Nestorius was with difficulty brought to an accommodation with Cyril of Alexandria, in virtue of which the condemnation of Nestorius by the council was acquiesced in by John, Bishop of Antioch. For a time, T. dissented from this condemnation of Nestorius; and he not only expressed these sentiments in a letter addressed to Nestorius himself, but also wrote formally against the celebrated anathemas of Cyril directed against Nestorianism. But he afterwards saw the necessity of yielding, and concurred in the deposition of those bishops who still persisted in their rejection of the council of Ephesus. Nevertheless, he by no means fully accepted the views of Cyril; and when, on Cyril's death, the opposition to Nestorianism began to develop, under the turbulent partisanship of his successor in the see of Alexandria, Dioscorus, into the contrary error of Eutychianism, T. endeavored to induce Dioscorus to abandon his extreme opinions.

Failing in the attempt, T. composed the work which has often figured in modern controversy, on account of the well-known passage as to the change of the Eucharistic elements which it contains, entitled 'Eranistes or the Many-shaped.' This work was regarded by Dioscorus as a renewal of the Nestorian error, and he accused T. to Domnus, the new Patriarch of Antioch, of that heresy. T. replied with great moderation; but Dioscorus persisted; and having engaged the imperial court on his side, succeeded in obtaining from the Emperor Theodosius II. an order confining T. within the limits of his own diocese. Meanwhile, the Eutychian controversy reached its height, and Eutyches (q. v.) having been first condemned by Flavian, Bishop of Constantinople, in a synod held in 448, was afterwards absolved in the celebrated Robber-council of Ephesus, under Dioscorus, in 449. The latter council not only excluded T. from its sittings, but formally deposed him from his see; whereupon he was compelled to retire to the monastery at Antioch in which he had received his first education. All this, however, was reversed by the general council of Chalcedon, in 451. T. did not very long survive his restoration. He died about the year 457. His works fill four volumes folio, reprinted in ten parts 8vo by Schulze (Halle, 1768—1774), and consist of commentaries on many books of the Old Testament and the whole of St. Paul's Epistles; a *History of the Church*, from 325 to 429 A.D., in five books; *Religious History*, being the lives of the so-called Fathers of the Desert, a series of most curious and interesting pictures of early ascetic life; the *Eranistes*, a dialogue against Eutychianism; *A Concise History of Heresies*, together with orations and a large number of letters. Of these works, his *History of the Church* is by far the best known, as well as the most important and interesting. See Schulze's edition of *Theodoreti Cyrensis Opera*.

THEO'DORIC, surnamed THE GREAT, the founder of the Ostrogothic monarchy, which comprised Italy, Sicily, South-eastern Gaul, Rhætia, Noricum, Pannonia, and Dalmatia, was born on the banks of the Neusiedler See, to the south of Vienna, in 455 A.D. His father, Theodemir, was one of the three brothers (the other two were Walamir and Widimir) who, on the death of Attila (453 A.D.), freed their nation from the yoke of the Huns, and being the representatives of the royal line of the Amali, exercised a united sovereignty over it; but the death of Walamir, and the departure to Italy and Gaul of Widimir with a part of the nation, left T.'s father sole ruler of the Ostrogoths who remained in Pannonia. Previous to these events, T. had been given as a hostage to the Eastern emperor, in accordance with whose directions he had been accustomed to all kinds of athletic and martial exercises, so that after his return (473) home, he was well qualified to fill the post of ruler of his ferocious and valiant kinsmen, which, by the death of his father, was left vacant in 475. In the previous year, the Ostrogoths had obtained parts of Mœsia and Dacia as settlements from the Emperor Zeno, and for years they gallantly defended the empire from foreign aggressors, other Gothic tribes included; but the impolitic faithlessness of Zeno produced in revenge the devastation of Thessaly and Macedonia, and subsequently (487) a raid directed on the capital itself. The emperor, to free himself from his troublesome ally, gave him permission to invade Italy, a suggestion gladly adopted by the warlike monarch, who started for Italy in 488; and after forcing his way through the Gepidæ and others who attempted to bar his progress, and gathering recruits on the way, arrived in the summer of 489 on the frontiers of Italy. Odoacer was both forewarned and forearmed; and a desperate conflict between the two powerful armies took place near Aquileia (28th August 489),

distinctly to the advantage of the Ostrogoths. A second and more disastrous defeat was inflicted on Odoacer near Verona (27th September), after which he took refuge in Ravenna; but having again gathered a large force, he was totally routed a third time on the banks of the Adda (August 490), again blockaded in Ravenna, while the whole of Italy was being subdued; and having at last surrendered, was treacherously murdered (March 493).

T. now assumed the title of *King of Italy*, resisted the claim of suzerainty preferred by the Eastern emperor; and with the exception of a victorious campaign against the Franks, to compel them to cease their assaults on the Visigothic dominions, the suppression of a rebellion in Spain against the authority of the infant monarch, his own grandson Amalric (during whose minority T. administered also the government of the Visigothic kingdom), and an expedition against the robber-hordes of the Bulgarians, the whole of his long reign was devoted to the consolidation and development of his new kingdom. His followers only received one-third of the conquered country; the rest was legally secured to the then possessors, and by degrees his barbarous followers were placed upon a footing of harmony with their fellow-subjects. T. made Ravenna his capital; occasionally, when his northern frontier was threatened, removing to Verona. He died in 526. T. holds the very highest rank among monarchs. An uneducated barbarian, and master of a power which even the most formidable of his neighbors, the Franks, could not have long withstood, he showed no desire of conquest; cultivated the friendship and esteem of the surrounding nations; ruled all classes of his subjects with irresistible authority, but with corresponding justice and moderation; zealously promoted agriculture and commerce till Italy again took its old position as the most prosperous country in Europe; and, himself an Arian, exhibited a tolerance of all other sects, which the latter, when their turn for supremacy came, were very far from imitating. The foul blot on his character is the judicial murder of Boëthius (q. v.) and Symmachus, for a supposed connivance with the senator Albinus to restore the authority of the Eastern emperor in Italy; but every fact that can be gathered respecting this event bears out the belief that it was the result of a burst of passion, intensified by his extreme, nay, almost morbid, jealousy of Byzantine interference in Italy.

The one great error of his administration consisted in his wholly neglecting to assimilate his Ostrogothic subjects with the previous inhabitants, either by a common code of laws, or by common official preferment; for though, under his sway, the evil of this separation did not appear, yet, when the sceptre fell to weaker hands, an antagonism necessarily arose between the ruling and the subject races, which was the chief cause of the successful restoration of Byzantine authority in Italy by Belisarius (q. v.) and Narses (q. v.). T. left no son; but his third daughter, Amalaswintha, succeeded him as regent for her son Athalaric; the eldest, Theodichusa, having become queen of the Visigoths, and the mother of Amalric; and the second, Ostrogotha, the wife of Sigismund, the last king of the Burgundians.

THEODO'SIUS, the name of three later Roman emperors.—THEODOSIUS I., surnamed THE GREAT, and THE ELDER, to distinguish him from his grandson, was of Spanish descent, and was born either at Italica (as Gibbon and those who wish to make him of kin with Trajan maintain), or more probably at Cauca, near Segovia, about 346 A.D. His father, also named Theodosius, was the great general of the Roman Empire, who, after freeing South Britain from the savage Caledonians, who roamed over it at their pleasure, and annihilating the formidable rebellion of the Moor Firmus, which threatened to divorce the African provinces from the empire, was conspired against by his many malicious enemies at court, and summarily beheaded at Carthage in 376. T., who had accompanied his father in his British campaigns, and afterwards, by routing the Sarmatians, saved Mœsia from devastation, retired from active service after his father's murder, and occupied himself with the care of his patrimonial lands in Spain. But his many virtues and talents were not forgotten at court; and on the defeat and death of Valens (q. v.), his colleague, Gratianus (q. v.), feeling his inability to sustain alone the cares of empire, summoned T. from his retirement, invested him with the imperial purple, and confided to him, 19th January 379, the administration of Thrace, Dacia, Macedonia, Egypt, and the East, and especially the protection of the empire against the Goths.

This last charge called for the full exercise of the new emperor's abilities, for the army at his command dared not face the Goths in the open field; and even when, after the death of their able leader, Fritigern, the Ostrogoths and Visigoths separated, each breaking up into several bands, T. found it most prudent to sow jealousy and dissension among them by promises and bribes, and after a four years' so-called campaign, succeeded in pacifying the Visigoths, the Ostrogoths retreating towards Scythia. The latter returned in 386, their ranks swelled by Scythians, but were totally routed in attempting to pass the Danube, and the survivors were transported to Phrygia and Lydia. In 387, T. undertook to restore to the throne of the Western Empire Valentinian II. (whose sister, Galla, he married), the brother of Gratian, who had been expelled by Maximus; and after a uniformly successful contest, the usurper was captured and put to death at Aquileia. In 392, the suspicious death of Valentinian, and the elevation of the puppet Eugenius by Arbogastes, the real ruler of the West, again summoned T. to interfere; and after two years of preparation, his motley army of Byzantines, Goths, Alans, and Huns, aided by the treachery of some of Eugenius's generals, gained a complete victory over the Gauls and Germans, who chiefly constituted the army of the West; and the two portions of the Roman Empire were again united under one ruler. The union, however, lasted only four months, owing to the death of T., 17th January 395. T., though a professor of the orthodox Christian faith, was not baptized till 380, and his behavior after that period stamps him as one of the most cruel and vindictive persecutors who ever wore the purple. His arbitrary establishment of the Nicene faith over the whole empire, the deprivation of civil rights of all apostates from Christianity and of the Eunomians, the sentence of death on the Manicheans and Quarto-decimans (q. v.), all prove this; though the want of evidence for the direct execution of these severe laws, somewhat modifies the unfavorable impression they produce, and inclines us to believe, that, like the massacre at Thessalonica, they were the result of a sudden access of savage passion, carefully fanned by his interested ecclesiastical advisers. His humiliation before St. Ambrose, Bishop of Milan, for the massacre at Thessalonica, was regarded by the church as one of its greatest victories over the temporal power. See AMBROSE.

THEODOSIUS II., surnamed THE YOUNGER, the only son and successor of Arcadius (q. v.), was born 401 A.D., succeeded his father when eight years old, and occupied the throne of the East for 42 years. The chief events of his reign were the invasion of the empire by the Huns under Attila, a war with Persia, renewed efforts to extirpate paganism, and the compilation of the *Codex Theodosianus* (see CODE). The emperor himself was the feeblest of rulers, and was much better adapted for the cowl than for the sceptre and sword.

THEO'GONY, the name given in ancient Greece to a class of poems recounting the genealogy of the gods. Musæus (q. v.) is said to have written the earliest Theogony; but his work, as well as the Theogonies of Orpheus (q. v.) and others, have perished; that of Hesiod (q. v.) being the only one that has come down to us.

THEO'LOGY (Gr. *theologia*, lit., a speaking or writing about God) is a term employed to denote the theory of the Divine nature and operation. It first occurs in Plato and Aristotle, who understand by it the doctrine of the Greek gods, and of their relation to the world. Homer, Hesiod, Orpheus, &c., are called *theologoi* (theologians), on account of the subject matter of their verse. But their theology is at the same time called 'mythic,' to distinguish it from the 'physical' theology of the philosophers, which, reversing the mythic order, concerned itself with speculative inquiries regarding the origin of the world and its relation to the gods. In the New Testament, the word theology does not occur, and the idea seems alien to the simplicity of the primitive Christian faith. The Greek Christians originally designated any deep philosophical apprehension of the truths of religion by the term *Gnosis* (knowledge), which was opposed to *Pistis* (faith), the simple irreflective trust of the majority of humble believers. First during the 3d and 4th centuries the word theology came into use, especially in connection with such of the Fathers as defended the doctrine of the Deity of the Logos. In this sense, the Evangelist John and Gregory of Nazianzen were termed *Theologians*. During the same period, the word theology was applied to the doctrine of the Trinity.

In the century following, its application was widened by Theodoret, who used it to denote the whole circle of theoretical instruction in religion; and finally, Abelard, through his *Theologia Christiana*, gave the word that comprehensive signification it still bears, as expressive not only of a theoretical but also a practical exposition of religious truth. The word Divinity is sometimes used to denote the same thing as theology.

THEO'PHILUS, one of the most important precursors of Dr. Faust, was, according to the legend, coadjutor-bishop at Adana, in Cilicia. After the death of his bishop, being unanimously chosen successor, he declined the proffered honor, but was shortly afterwards, at the instigation of slanderers, deposed from his former office by the new bishop. He now had recourse to a Jew magician, who took him to a midnight meeting of devils, whose chief ordered him to deny Christ and Mary, and to give a bond, making over his soul. The result was, that next morning he was reinstated in his office and dignities by the bishop; and now, presuming on the support of his confederates, he began to assume a supercilious and domineering manner. But he was soon overtaken with remorse, and, through forty days' fasting and prayers, prevailed on Mary to intercede with her son for him, and to get

back the letter from the devil, which she laid upon the breast of the repentant sinner as he lay asleep in the church. T. then made a public confession of his crime, told of the goodness of the Virgin Mary, and died three days after. This legend, whose origin is traced back to an unknown Greek, of the name of Eutychianus, was brought, during the 10th c., through an equally unknown Neapolitan priest, named Paulus, to the West, where it very quickly spread far and wide. Before the end of the century, it was put into Latin verse by Roswitha, and still better, by the Bishop of Rennes, who died in 1123 (printed in the *Acta Sanctorum*, February 4; and in *Hildeberti Turonensis et Marbodi Opera*, published by Beaugendre, Par. 1708). Gauthier de Coinsy (died after 1236) turned it into a beautiful French poem (printed in *Œuvres de Rutebeuf*, published by Jubinal, 2 vols.); and the Rhenish compiler of the *Alte Passional* admitted it among his legends of Mary (*Marienlegenden*, published by Pfeiffer, Stuttg. 1846).

A Dutch metrical version, in the 14th c., was published by Blommaert (*Theophilus*, Ghent, 1836). The first dramatic handling of the subject was in French by Rutebeuf, a distinguished troubadour of the 13th c. (*Œuvres*, published by Jubinal, 2 vols., Par. 1839); then repeatedly during the 14th and 15th centuries in Low-German (*Romantische und andere Gedichte in altplattdeutscher Sprache*, published by Bruns, Berl. and Stettin, 1798; *Theophilus, in Icelandic, Low-German, and other Tongues*, by Dasent, Lond. 1845). The legend of T. is also not seldom to be found inserted in large works, and frequent allusions to it occur in Latin, German, Anglo-Saxon, Icelandic, Swedish, French, and even Spanish literature. It has even been pictorially represented in French churches. With the 16th c., it seems to have disappeared. However much the various versions differ from one another in the minor circumstances, the essential traits remain throughout unchanged: that T. made a compact with the devil in order to recover lost property; that he attained his object, but at the same time nothing more (nothing whatever of magic art), and that Mary rescued the repentant sinner. Through this legend of T., the oldest known instance of a compact with the devil, there runs a lenient spirit (derived from paganism, and which the Roman Catholic Church was able to sanction by interposing the Virgin Mary), which distinguishes it markedly and essentially from the stern Protestant shape of the devil's compact in the Faust-book, which, with rigorous consistency, requires the consignment of the contracting party to hell.

THEOPHRA'STUS, the Greek moralist and naturalist, was born at Eresus, in Lesbos, and studied philosophy at Athens, first under Plato, and subsequently under Aristotle. The latter took especial interest in him, and according to a rather incredible legend, altered his original name of Tyrtamus into that of Theophrastus (divine speaker), in compliment to the fluent and graceful speech of his pupil. To T., moreover, he bequeathed the presidency of the Lyceum, his library, and the original MSS. of his writings. T. proved a worthy successor of the Stagirite. Under his presidency, the Lyceum sustained its character, and attracted no fewer than 2000 disciples, among whom was the comic poet Menander. The kings Philippus, Cassander, and Ptolemy held him in high esteem; and such was the admiration of the people of Athens for him, that, when he was arraigned for impiety and triumphantly acquitted, they would have killed his accuser, had he not generously interceded. In compliance, however, with the law of Sophocles, which decreed the banishment of all philosophers from Athens, T., in 305 B.C., left the city, until the enactment was repealed the very next year by Philo, also a disciple of Aristotle. From that date, T. continued his lectures until his death in 287, at which time he had presided over the Academy for 35 years. His birth being unknown, we are ignorant of his age at the time of his death, and conjectures variously give it from 85 to 107 years. On the eve of dissolution he is said to have complained of the shortness of human life, which ended just when he was about to solve its enigmas. He was accompanied to the grave by the entire Athenian population. He bequeathed his library to Neleus of Scepsis. The great object of his philosophical labors was to develop the Aristotelian system, to explain the difficulties which obscured it, and to fill up the gaps which left it incomplete. Most of the works which he wrote with this object have perished; only the following remain: 1. *Characteres*, in 30 chapters, descriptive of vicious characters; 2. *Of Sensuous Perception and its Objects;* 3. A fragment on *Metaphysics;* 4. *Of the History of Plants*, in 10 books, one of the earliest of extant treatises on botany; 5. *Of the Causes of Plants*, in 8 books, of which, however, only 6 remain; 6. *Of Stones*. The best complete edition of T. is that of Schneider; there are numerous editions of the *Characteres* separately.

THE'ORY, a word expressing the scientific process of generalization under various aspects.

Theory is, in the first place, opposed to Fact, or matter of fact, and signifies that a certain class of facts have been generalized and brought into a single comprehensive statement. It thus corresponds to a Principle, general truth, or Law of Nature. That a half-inflated bladder hung before the fire is expanded till it bursts, is a matter of fact; that bodies generally are expanded by heat, is the theory or general principle, comprehending the whole class of facts. To give the theory of a fact, in this sense of the word, is to give its general law; this is also called its Explanation, and sometimes its Cause. See CAUSE.

Theory, in the next place, is opposed to Hypothesis (q. v.). A fact may, for a time, be referred to a hypothetical or assumed principle; endeavors being meanwhile made to remove the hypothetical character, by proving or disproving the principle. The vortices of Descartes was a hypothesis to account for planitary motions; while Newton's view, that gravity might be the cause of these motions, was, in the first instance, a hypothesis. The Cartesian doctrine was disproved and abandoned; the Newtonian was fully verified, and, ceasing to be a hypothesis, became a theory.

Lastly, Theory is opposed to Practice. The Theory of a subject is the knowledge or explanation of it; the Practice is making some use of it. Physiology is Theory; Physic, or Medicine, is practice. In practical matters, there are two modes of procedure which are still further illustrative of the distinction now in hand. The knowledge possessed by a worker in any art may be empirical, experimental, rule-of-thumb—that is, it may be gathered by actual experience in the particular operation. The seaman's knowledge of the prognostics of weather, and the cook's art in boiling and roasting, are usually of this kind. On the other hand, the worker's knowledge may be obtained from Theory, in other words, from general principles or laws scientifically ascertained; as when the theory of the winds and the law of storms are employed to predict the weather; when the cook roasts and boils according to the known temperature for coagulating albumen; and when a physician prescribes a dietary grounded on a chemical analysis of the food and of the tissues to be maintained.

Great caution is required in the employment of such theoretical knowledge in the arts and in practical affairs. It is not enough that the theories are fully established; we must also know all the conditions of the case, so as to allow for every agent operating to produce or to mar the effect. That a cannon-ball should describe a parabola, is a correct theoretical inference from gravity and the laws of motion; but the resistance of the air, a distinct agency, makes it untrue in fact, and therefore misguiding in practice. When this resistance is allowed for, the theory is complete, and its application will no longer disappoint the operator. See DEDUCTION.

THEO'SOPHY (Gr. *theosophia*, divine wisdom), the name given to a so-called sacred science, which holds a place distinct as well from that of philosophy as from that of theology, even in questions where these latter sciences have the same object with it, namely, the nature and attributes of God. In investigating the divine nature and attributes, philosophy proceeds entirely by the dialectic method, employing as the basis of its investigation the ideas derived from natural reason; theology, still employing the same method, superadds to the principles of natural reason those derived from authority and revelation. Theosophy, on the contrary, professes to exclude all dialectical process, and to derive its knowledge of God from direct and immediate intuition and contemplation, or from the immediate communications of God himself. Theosophy, therefore, so far as regards the science of God, is but another name for MYSTICISM (q. v.), although the latter name implies much more; and the direct and immediate knowledge or intuition of God, to which the Mystics laid claim, was, in fact, the foundation of that intimate union with God, and consequent abstraction from outer things, which they made the basis of their moral and ascetical system. The theosophic system dates from a very high antiquity; and within the Christian period we may number among Theosophs, the Neo-Platonists, especially Plotinus, Iamblichus, and Proclus; the Hesychasts of the Greek Church; all those of the medieval Mystics who laid claim to any dogmatical theory; and in later times, the Paracelsists, Bodenstein and Thalhauser, Weizel, Jacob Böhme, and above all, Immanuel Swedenborg. If we consider one particular view of the philosophic system of Schelling, he also may be assigned to the same school.

THERAPEU'TÆ, a pious 'Jewish' sect, mentioned in a book ascribed to Philo, as living chiefly on the Lake Mareotis, near Alexandria, but as having also numerous colonies in other parts of the world. They are described as in many respects like the Essenes (q. v.). Like them, they lived unmarried in a kind of monastery, were very moderate with regard to food and dress, the latter consisting in a white garment; prayed at sunrise, their face turned to the sun; studied much in the Scriptures—which they explained allegorically—and in other 'ancient books,' and were principally opposed to slavery. The chief differences between these two 'sects,' as they are described to us, consisted in the T. simply living a life of contemplation, while the Essenes followed many occupations, such as agriculture, arts, &c.; the latter lived

together, while the T. lived separately in their cells; the Essenes not only took an interest in other human beings, but actively assisted them; while the T., who also, before they entered the brotherhood, divided their property among their relatives, contrary to the 'common treasure' of the Essenes, kept in utter ignorance of the outer world. Again, the T. knew none of the divisions which marked the degrees of initiation among the Essenes, but they held the Temple at Jerusalem in much higher veneration than the latter; the T. brought up boys to the brotherhood, while the Essenes only recruited themselves from grown-up people. One of the chief characteristics of the T. was also the religious meals they used to hold in common on every seventh Sabbath; the Essenes having two such sacred meals daily. Many and striking are also the analogies offered by their mode of life and their doctrines to those of the Pythagoreans. Neither partook, e. g., of animal food or wine, and both admitted women to their assemblies, which were mostly concluded with hymns; and they both held the number seven sacred. Many theories have been broached regarding this mysterious sect. One of the most plausible notions is the one—now commonly accepted—of the whole book *De Vita Contemplativa*, which treats of this sect, being falsely attributed to Philo. It is rather believed to be the work of an early Christian, intended to idealize the life of Christian monasticism and asceticism of the first centuries. See ESSENES.

THERAPEU'TICS (Gr. *Therapeuo*, I heal) is that division of the science of medicine which treats of the various actions of remedies upon the diseased animal system, or the means by which nature may be aided in her return to health.

THERAPI'A, or TARAPIA, a small Turkish town of about 3000 inhabitants, is situated on the Bosporus, 21 miles north-north-east of Constantinople, at the head of a large and beautiful bay of the same name. It is one of the most charmingly picturesque spots in the neighborhood of the Turkish capital, and all summer has a climate deliciously cool. T. is the residence of the French and English embassies, and many of the Frankish merchants have villas here.

THERAPO'NIDÆ, a family of acanthopterous fishes, allied to *Percidæ*, from which they are distinguished by having 6 instead of 7 branchiostegal rays. The scales in some are ctenoid, in others cycloid. Some are fresh-water fishes. None are British. Some are found in the lakes and rivers of North America.

THERESIO'PEL, more commonly called MARIA-THERESIOPEL (Hung. *Szabadka*), an important town in the Hungarian county of Bacs, 24 miles west-south-west of Szegedin, on the Palitsch Lake. It is well built, but unpaved; contains numerous important buildings, as the churches, gymnasium, and the great barracks. Manufactures of leather and shoes, linen-weaving, dyeing, the cultivation of tobacco and fruits, together with the rearing of cattle, are the chief branches of industry. Pop. (1869) 56,323; (1880) 61,367.

THERI'ACA (Gr. *ther*, a wild or a venomous animal), a medicine in the form of an electuary, supposed to be an antidote to the poison of venomous animals. It was invented by Andromachus of Crete, physician to the Emperor Nero, and was described in a poem, preserved in Galen's work, *De Antidotis*. This theriac was a mishmash of about 70 ingredients, some of them quite inert, and others antagonistic to one another. Yet it continued in repute until recent times, and it is not long since in Venice, Holland, France, and other places, the druggists had to prepare the compound with certain solemnities in the presence of the magistrates. The term theriaca was applied to various compounds of a similar nature, and *theriac* and *theriacal* became synonymous with medicinal. The English word *treacle* is a corruption of *theriacal*, and originally meant an electuary, or compound syrupy medicine (e. g., Venice treacle = the theriac of Andromachus); and it was applied to molasses from the similarity in appearance.

THE'RMIDOR, i. e., the 'Hot Month,' formed, in the calendar of the first French Republic, the 11th month, and lasted from the 19th July to the 18th August. The 9th Thermidor of the Republican year 2 (July 27, 1795) is historically memorable as the date of Robespierre's fall, and the termination of the Reign of Terror. The name Thermidorians was given to all those who took part in this fortunate *coup d'état*, but more particularly to those who were desirous of restoring the monarchy.—See Duval's *Souvenirs Thermidoriens* (2 vols., Par. 1844).

THE'RMO-DYNA'MICS, or the DYNAMICAL THEORY OF HEAT, though literally merely the science of the relations of Heat and Work, is now very generally employed to denote the whole science of ENERGY. See FORCE. We propose in this place to give a general sketch of this grand modern generalization, supplementary to what will be found in the article just referred to; but, for the sake of continuity, we must repeat a little of what was there given, though in a somewhat different form.

Energy is strictly defined as the power of doing Work (q. v.), and is of one or other of two kinds—*Potential* or *Kinetic*. A raised weight, a wound-up spring, gunpowder, and the food of animals, are instances of stores of potential energy. A missile in motion, wind, heat, and electric currents are instances of kinetic energy. Sound, Light, and other forms of Wave-motion (see WAVE), are all instances of mixed potential and kinetic energy.

The modern theory of Energy contemplates its

CONSERVATION,
TRANSFORMATION, and
DISSIPATION.

The CONSERVATION OF ENERGY is the statement of the experimental fact, that Energy is, like Matter (q. v.), indestructible and uncreatable by any process at the command of man.

The TRANSFORMATION OF ENERGY is the statement of the experimental fact, that any one form of energy may in general be transformed wholly or partially into any other form. This used to be known as the CORRELATION OF FORCES. But it is subject to the condition derived from the first fact, that the portion transformed retains its amount unchanged. It is also subject to the law of DISSIPATION, or Degradation, which is a statement of the experimental fact, that Energy generally tends at every transformation to at least a partial transformation into heat; and that, once in that form, it tends to a state of uniform distribution, in which no further transformation is possible.

The original energy of the universe, therefore, though still of the same amount as at creation, being in a state of ceaseless transformation, has been in great part frittered down into heat, and will at length take wholly that final form.

The history of the grand discoveries which are briefly summarized in these few lines, has been much discussed of late—especially in the *Philosophical Magazine*—and is now pretty clearly ascertained.

Newton took the first great step. In a Scholium to his Third Law of Motion (q. v.), he lays down in a few clear words the Conservation of Energy as the embodiment of the experimental results known in his day with reference to forces and visible motions. Part of this statement of Newton's was afterwards reinvented under the name of Conservation of Vis-viva; but all that Newton really wanted to enable him to complete the Conservation of Energy was an experimental knowledge of the nature of Heat, Electricity, &c. That heat is motion of some kind, not matter, and that the laws of its communication are the same as those of the communication of visible motion, was experimentally proved at the very end of last century by Davy. Rumford had almost completed a proof a year or two before; but he had also made a very fair attempt to determine the 'Mechanical Equivalent' of heat—i. e., the quantity of heat which is equivalent to a given amount of mechanical work. That there is such an equivalent is at once evident by looking at Davy's discovery in the light of Newton's Scholium already referred to. But though the Dynamical Theory of Heat was thus really founded in 1799, it was not generally received. The first to recall attention to it was Séguin, nephew of the celebrated Montgolfier (from whom he states that he derived his views), who, in 1839, distinctly enunciated the equivalence of heat and mechanical work, and sought to prove by experiment that heat disappears, or is put out of existence, in the production of work from a steam-engine.

In 1842, Mayer published a short note, in which he enunciated the Conservation of Energy as a metaphysical deduction from the maxim, *Causa æquat effectum*. He made no experiments to prove this general statement, but he made a calculation of the mechanical equivalent of heat from the specific heats of air—assuming that when heat is produced by compression, its amount is the equivalent of the work spent in compressing. His result was erroneous, because his data were imperfect. But it appears that his assumption, quite unwarranted as it was, is really very nearly true for air.

In 1843, Colding, led also by some metaphysical speculations, propounded the doctrine, but endeavored to base it upon actual experiments.

Finally, Joule (q. v.), also in 1843, published an experimental determination of the mechanical equivalent of heat (770 foot pounds as the work required to heat a pound of water one degree F.), which is within half per cent. of the most trustworthy results since obtained. Joule had been, since 1840 at least, making quantitative determinations of equivalence between various forms of energy; and was led to propound the general law of Conservation of Energy by the only legitimate process—viz., experiment, as contrasted with metaphysical assertions of what ought to be. The complete foundation of the science on a proper basis is thus due to him; though, as we have seen, portions of it were established thoroughly by Newton and by Davy.

Before we consider what are the principal features of the theory as now developed, it is necessary to refer to the admirable investigations of Fourier and Carnot, which, though in some respects defective, must be considered as real advances. Fourier's great work, *Théorie de la Chaleur*, is devoted to the laws of conduction

and radiation, i. e., to the dissipation of heat, and is one of the most remarkable mathematical works ever written. Carnot's work, *Sur la Puissance Motrice du Feu*, is the first in which any attempt is made to explain the production of work from heat. It is unfortunately marred by his assumption, that heat is a material substance, though it is only fair to say that he expresses grave doubts as to the truth of this hypothesis.

(We borrow our notice of Carnot from a paper by Sir W. Thomson (q. v.) in the *Transactions of the Royal Society of Edinburgh*, 1849.)

He begins his investigation by premising the following correct principle, sadly neglected by many subsequent writers: 'If a body, after having experienced a certain number of transformations, be brought identically to its primitive physical state as to density, temperature, and molecular constitution, it must contain the same quantity of heat as that which it initially possessed.' Hence he concludes, that when heat produces work, it is in consequence of its being *let down* from a hot body to a cold one, as from the boiler to the condenser of a steam engine. His investigation, though based on an erroneous hypothesis, is extremely ingenious, and forms the foundation of the modern theory. We give a sketch of it preparatory to our account of the present state of the theory, and for this purpose we choose a somewhat hypothetical case, as simpler than the most common practical one. This is the case of a piston working air-tight in a cylinder closed at the bottom.

Suppose we have two bodies, A and B, whose temperatures, S and T, are maintained uniform, A being the warmer body, and suppose we have a stand, C, which is a non-conductor of heat. Let the sides of the cylinder and the piston be also non-conductors, but let the bottom of the cylinder be a perfect conductor; and let the cylinder contain a little water, nearly touching the piston when pushed down. Set the cylinder on A; then the water will at once acquire the temperature S., and steam at the same temperature will be formed, so that a certain pressure must be exerted to prevent the piston from rising. Let us take this condition as our starting-point for the cycle of operations. 1. Allow the piston to rise gradually; work is done by the pressure of the steam, which goes on increasing in quantity as the piston rises, so as always to be at the same temperature and pressure. And *heat is abstracted from A*, namely, the latent heat of the steam formed during the operation. 2. Place the cylinder on C, and allow the steam to raise the piston further. More work is done, more steam is formed, but the temperature sinks on account of the latent heat required for the formation of the new steam. Allow this process to go on till the temperature falls to T, the temperature of the body B. 3. Now, place the cylinder on B; there is of course no transfer of heat; because two bodies are said to have the same temperature when, if they be put in contact, neither parts with heat to the other. But if we now press down the piston, we do work upon the contents of the cylinder, steam is liquefied, and the latent heat developed is at once absorbed by B. Carry on this process *till the amount of heat given to B is exactly equal to that taken from A* in the first operation, and place the cylinder on the non-conductor C. The temperature of the contents is now T, and the amount of caloric in them is precisely the same as before the first operation. 4. Press down the piston further, till it occupies the same position as before the first operation; additional work is done on the contents of the cylinder, a further amount of steam is liquefied, and the temperature rises.

Moreover, *it rises to S exactly*, by the fundamental axiom, because the volume occupied by the water and steam is the same as before the first operation, and the quantity of caloric they contain is also the same—as much having been abstracted in the third operation as was communicated in the first—while in the second and fourth operations, the contents of the cylinder neither gain nor lose caloric, as they are surrounded by non-conductors.

Now, during the first two operations, work was done by the steam on the piston; during the last two, work was done against the steam; on the whole, the work done by the steam exceeds that done upon it, since evidently the temperature of the contents, for any position of the piston in its ascent, was greater than for the same position in the decent, except at the initial and final positions, where it is the same. Hence the pressure also was greater at each stage in the ascent than at the corresponding stage in the descent; from which the theorem is evident.

Hence, on the whole, a certain amount of work has been communicated by the motion of the piston to external bodies; and the contents of the cylinder having been exactly restored to their primitive condition, we are entitled to regard this work as due to the caloric employed in the process. This, we see, was taken from A, and wholly transferred to B. It thus appears ,that *caloric does work by being let down from a higher to a lower temperature*. And the reader may easily see that if we knew the laws which connect the pressure of saturated steam, and the amount of caloric it contains, with its volume and temperature, it would be possible to apply a rigorous calculation to the various processes of the cycle above explained, and to express by formulæ the amount of work gained on the whole in the series of operations, in terms of the temperatures (S and T) of the boiler and condenser of a steam-engine, and the whole amount of caloric which passes from one to the other.

Though the above process is exceedingly ingenious and important, it is to a considerable extent vitiated by the assumption of the materiality of heat which is made throughout. To show this, it is only necessary to consider the second operation, where *work is supposed to be done* by the contents of the cylinder expanding *without loss or gain of caloric*, a supposition which our present knowledge of the nature of heat shows to be incorrect. But it is quite easy, as seems to have been first remarked by J. Thomson in 1849, to put Carnot's statement in a form which is rigorously correct, whatever be the nature of heat. J. Thomson says: 'We should not say, in the third operation, "compress till the same amount of heat is given out as was taken in during the first." But we should say, "compress till we have let out so much heat that the further compression (during the fourth stage) to the original volume may give back the original temperature."' It is but bare justice, however, to acknowledge that Carnot himself was by no means satisfied with the caloric hypothesis, and that he insinuates, as we have already seen, more than a mere suspicion of its correctness.

If we carefully examine the above cycle of operations, we easily see that they are *reversible*, i. e., that the transference of the given amount of caloric back again from B to A, by performing the same operations in the opposite order, requires that we expend on the piston, on the whole, as much work as was gained during the direct operations. This most important idea is due to Carnot, and from it he duduces his test of a *perfect* engine, or one which yields from the transference of a given quantity of caloric from one body to another (each being at a given temperature) the greatest possible amount of work. And the test is simply that *the cycle of operations must be reversible*.

To prove it, we need only consider that,if a heat-engine, M, could be made to give more work by transferring a given amount of caloric from A to B, than a reversible engine, N, does, we may set M and N to work in combination, M driven by the transfer of heat, and in turn driving N, which is employed to restore the heat to the source. The compound system would thus in each cycle produce an amount of work equal to the excess of that done by M over that expended on N, without on the whole any transference of heat; which is of course absurd.

The application of the true theory of heat to these propositions was made in 1849, 1850, and 1851 respectively, by Rankine, Clausius, and Sir W. Thomson. Rankine employed a hypothesis as to the nature of the motion of which heat consists, from which he deduced a great many valuable results. Clausius supplied the defects of Carnot's beautiful reasoning; accommodating it to the dynamical theory by a very simple change, and evolving a great number of important consequences. But by far the simplest, though at the same time the most profound, writings on this subject, are those of Sir W. Thomson, to be found in the *Transactions of the Royal Society of Edinburgh;* and these must be consulted by any reader who desires to have a clear statement and proof of thermo-dynamical laws, not complicated by unnecessary hypotheses or formulæ, and yet perfectly general in its application. See also Tait's *Thermo-Dynamics* (2d ed. 1877).

In its new form, thermo-dynamics is based on the two following laws:

Law I. (Davy and Joule.) *When equal quantities of mechanical effect are produced by any means whatever from purely thermal sources, or lost in purely thermal effects, equal quantities of heat are put out of existence, or are generated.*

Law II. (Carnot and Clausius.) *If an engine be such that, when it is worked backwards, the physical and mechanical agencies in every part of its motions are all reversed, it produces as much mechanical effect as can be produced by any thermo-dynamic engine, with the same temperatures of source and refrigerator from a given quantity of heat.*

The proof of this second law differs from that of Carnot (already given as regards reversible engines) by being no longer based on the supposition of the materiality of heat, but on the following axiom, in some of its many possible forms—It is impossible, by means of inanimate material agency, to derive mechanical effect from any portion of matter by cooling it below the temperature of the coldest of the surrounding objects. It will be easily seen that the pair of engines (one reversible) before mentioned would, if worked in combination, form a perpetual motion; and, besides, would constantly transfer heat from a colder to a warmer body.

One of the immediate and most important deductions from these principles is—that only a fraction of the heat employed in any engine is converted into useful work (the remainder being irre-

coverably lost). This fraction was shown by Thomson to be capable of expression as $\frac{S - T}{S}$; where S and T are the temperatures of the source and condenser, *measured from the absolute zero* of temperature. See HEAT. Thus, an air engine, in which a far greater range of temperature can be safely used than in a steam-engine, employs effectively a much larger portion of the heat supplied to it; and there is no doubt that air-engines would supersede steam-engines, if we could get a material capable of enduring the great heat required.

THERMO-ELECTRI'CITY treats of the currents that arise from heating the junction of two heterogeneous conductors. Such currents can be obtained in many ways, but we shall here simply indicate the more important.

Thermal Currents with one Metal.—Take a copper wire, cut it in two, and fix each half in one of the binding screws of a galvanometer. Heat one of the free ends to redness, and press it against the other, and a current will be generated, passing at the junction from the hot to the cold end, as shown by the deflecting needle. In almost all cases where portions of the same metal at different temperatures are pressed together a current is produced, the direction of which depends on the metal, and even on the structure of the same metal.

Currents are also obtained when two portions of the same metal or piece of metal have different structures, and the point where the two structures meet is heated. If, for instance, one piece of wire be hard-drawn and the other part annealed, when the seat of change from the one to the other is heated, a current is produced. Or if the whole be annealed, and one part of it be hammered, the hammering makes the other part harder, and the current, when the junction is heated, passes from the soft to the hard part. The direction of the current differs with different metals in these circumstances. Even the difference of structure introduced by the twisting of a portion of a wire, causes a current to flow when the wire is heated in the vicinity of the twist. Thus, when a knot is tied on a platinum wire, or when part of it is coiled into a spiral, a current passes always towards the knot or coil when the flame of a spirit-lamp is directed on a portion of the wire near the knot or spiral. The twisting, in this case, acts as hardening or hammering would do.

By running the flame of a spirit-lamp along a metal, it frequently happens, more especially if it be of a crystalline structure, that currents are produced at certain points. These points are supposed to indicate a change in structure. If a bar of fused antimony have its ends connected with a galvanometer, and examined in this way, *neutral points* are generally found. The flame of a lamp generates a current near these points, always passing towards the point, and changing in direction with the change of the side on which the flame is applied. Bismuth shows neutral points, but the current always goes from the cold to the hot part across the neutral point. In bars of those metals which are crystallized regularly and slowly, no neutral points are found.

Thermal Currents with two Metals.—A current is always obtained when the point of junction of any two metals is heated. The two metals which show this property in the greatest degree are bismuth and antimony. When a bar of antimony, A (fig. 1), is soldered to a bar of bismuth, B, and their free extremities are connected with a galvanometer, G, on the junction being heated, a current passes from the bismuth to the antimony, as shown in the figure. When S is chilled by applying ice, or otherwise, a current is also produced, but in the opposite direction. Such a combination constitutes a thermo-electric pair. Applying the same mode of explanation to this pair that we apply to the galvanic pair (see GALVANISM), bismuth is positive within and negative without the pair, antimony negative within and positive without the pair. Bismuth thus forms the negative pole, but positive element; antimony the positive pole, but negative element of the pair. The metals may be classed in thermo-electric just as in electro-chemical order.

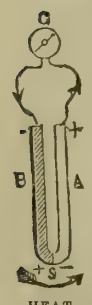


Fig. 1.

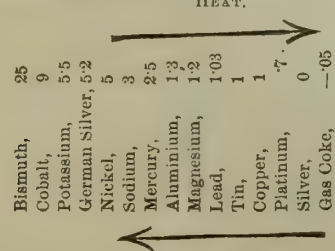
The following table gives them in this order, the direction of the arrow showing how the current goes within the pair :



The order and numbers in this table, which are for temperatures between 40° and 100° F., are those given by Dr. Mathiessen. For other temperatures, the table would be different for several of the metals.

It will be seen, that metals like bismuth and antimony, which have a crystalline structure, are best suited for a thermo-electric pair. Tourmaline, when heated, shows an opposite electricity at each end. If it had a low conducting power like the metals just named, we might expect from it a thermo-electric current instead of mere polarity. It is probable that the crystalline structure, however, accounts for the appearance of electricity in both cases.

Thermo-electric Pile or Battery.—One bismuth-antimony pair is of very little power. To increase this, several pairs are associated together, as shown in fig. 2, where the same tension-arrangement is adopted as in a galvanic battery. The heat in this case must be applied only to one row of soldered faces. The current depends on the difference of temperature of the two sides. When a strong current is required, the one series must be kept in ice, or in a freezing mixture, whilst the other is exposed to heat radiating from a red-hot plate of iron. As in the galvanic pair, the electro-motive force is proportionate to the number of pairs; the size of the bars, like the size of the galvanic plates, merely aiding to diminish the resistance. The electro-motive force of a thermo-electric battery is small; according to Dr. Mathiessen, that of 25 bismuth-tellurium pairs equals one cell of Daniell's battery, when the one series is kept at 32° F. and the other at 212° F. In consequence of the low electro-motive force of the thermo-electric battery, the galvanometer to be used with it must introduce as little resistance as is consistent with the best effect on the needle. Hence special galvanometers are used, in which the coil wire is short (200 turns) and thick ($\frac{1}{25}$ inch); these are called theremo-galvanometers.

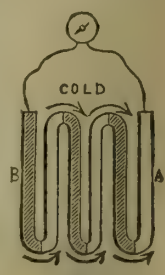


Fig. 2.

When a great number of pairs are formed into a battery, they may be conveniently arranged as in fig. 3, which shows one of 30 pairs. The odd faces, 1, 3, 5, &c., are exposed on the one side, and the even faces, 2, 4, 6, &c., on the other. The terminal bars are connected with the binding screws *n*, *p*. The interstices of the bars are filled with insulating matter (gypsum) to keep them separate, and the frame in which the whole is placed is of non-conducting matter. Such a pile in conjunction with a thermo-galvanometer (see GALVANISM) forms the most delicate thermometer for radiant heat, and is generally called a *thermo-multiplier*. When placed in a room, the temperature of which is equable all round, no current is produced; but if heat be radiated more on one side than another, a current ensues. If the hand, for instance, be brought near on the one side, a current indicates its radiant power; or if a piece of ice be brought near, a current is also shown, but moving in the opposite way.

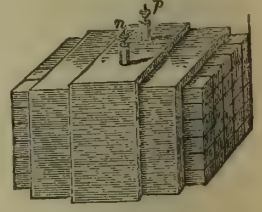

Fig. 3.

Thermal Effects produced by the Galvanic Current.—As heat or cold produces a current at the junction of two dissimilar conductors, we should expect that if a galvanic current be made to pass through the junction, heat or cold would follow, and such is found to be the fact. When a current from a voltaic cell passes, as shown in fig. 4, through a system of three rods of bismuth, antimony, and bismuth, at the junction where the current passes from bismuth to antimony, cold is produced; and at the other, from antimony to bismuth, heat. If, for instance, water be placed in a hollow at either junction, cooled to 32° F., it will become frozen when the current passes from the bismuth to the antimony. When the junction of these two metals is put into the bulb of an air thermometer, so that a current can be sent through it in either way, the air expands when the current goes from antimony to bismuth, but contracts when it goes in the opposite way. See THERMO-ELECTRICITY, where the theory of energy is applied to the explanation of the various phenomena.

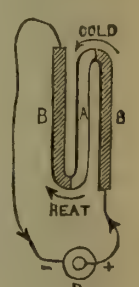

Fig. 4.

Seebeck was the discover (1821) of thermo-electricity; Nobili invented the thermo-electric pile (1834); Peltier (1834) first observed the thermal effects of galvanic currents at the junction of heterogeneous conductors.

THE'RMO-ELECTRI'CITY AND THERMO-MAGNETISM. If the ends of an iron wire be attached by twisting or soldering to the extremities of the copper wire of a galvanometer, and one

of these junctions be heated, the galvanometer indicates the passage of a current in the circuit in a direction from copper to iron through the heated junction. The first application of the theory of energy to this phenomenon is of course as follows: Since heating the junction produces the energy of the current, part of the heat must be expended in this process; though it is of course entirely recovered as heat in the circuit, if the current be not employed to do external work. The existence of the current from copper to iron is thus associated with the cooling of the junction; and it had been experimentally shown by Peltier, that if an electric current be passed through a circuit of iron and copper, originally at the same temperature throughout, it produced cold when passing from copper to iron, and heat when passing from iron to copper. If the two junctions be maintained each at a constant temperature, a constant current passes from the warmer to the colder junction through the iron wire; and by the conservation of energy, the heat developed in the circuit (together with the equivalent of the external work done, if the current be employed to drive an electro-magnetic engine) is equal to the excess of the heat absorbed at the warmer junction over that given out at the colder, precisely as in the case of a heat-engine. So far the process presents no difficulties. But it was discovered by Cumming in 1823, that not only is the strength of the current *not* generally proportional to the difference of temperatures of the junctions, but that if the difference be sufficiently great, the current may, in many cases, pass in the opposite direction. Thus, in the copper-iron circuit, at the temperature 300° C. of the hot junction, the current passes through it from iron to copper.

Thomson (Bakerian Lecture—*Phil. Trans.* 1855—'On the Electro-dynamic Properties of Metals') applied the principle of energy to this case, and derived from it the conclusion, that one of three things must happen, the most unexpected of which was found by experiment to be the actual one—viz., the startling result, that *a current passing in an iron bar or wire from a hot to a cold part produces a cooling, but in copper a heating, effect.* This very remarkable discovery, which, taken in connection with that of Peltier, gives the key to the whole subject of thermo-electricity, has been made the subject of a valuable experimental investigation by Le Roux (*Annales de Chimie*, 1867).

The theory of such phenomena (and of others far more complex, involving, for instance, crystalline arrangement), in complete accordance with the conservation of energy, has been given by Thomson (*Trans. Royal Soc. Edin.* 1854); but it would be inconsistent with the character of this work to enter into any details on so abstruse a subject. A similar remark must be made regarding his application of the principle to the subject of thermo-magnetism, or the relation of the magnetizability of various substances to their temperature; one or two of his results may, however, be mentioned. Thus, iron at a moderate or low red-heat experiences a heating effect when allowed to approach a magnet, and a cooling effect when slowly drawn away from it; while in cobalt, at ordinary temperatures, exactly the opposite effects are produced. Similar effects are in general produced when a doubly-refracting crystal is turned in the neighborhood of a magnet.

THERMO'METER (Gr. literally *heat-measurer*), a term which, in spite of its derivation, is usually restricted to instruments which measure temperature (see HEAT) by the *expansion* of bodies. Like that of the telescope and microscope, and many other valuable pieces of philosophical apparatus, its early history is very obscure. There are various claimants who seek to share at least a part in the credit of its invention; and they agree pretty well in referring it to somewhere in the beginning of the 17th century. We shall not waste space in endeavoring to settle such matters of history, but proceed at once to a description of the forms of the instrument now most commonly used; after which we shall say a few words about the actual value of their indications, and finish by a rapid sketch of a few other instruments also adapted for the measurement of temperature, but not usually known by the name of thermometer.

Let us commence with the ordinary spirit-thermometer, as it is called; where the indications are given by the expansion of a quantity of alcohol which fills entirely a glass bulb, and partially a narrow tube attached to it.

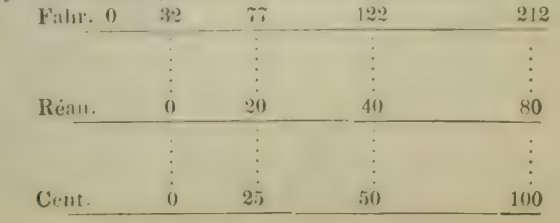
To construct such an instrument, a capillary tube is selected, of as uniform a bore as possible. The easiest method of testing its uniformity is to introduce a column of mercury, about an inch long, into the tube, and gradually move it along by inclining the tube, carefully measuring the length of the column in each of its successive positions. It is obvious that the column will be longer the smaller is the mean section of the portion of the tube occupied at any time by the drop of mercury. If considerable differences of length are found, the tube is rejected at once. The best tubes are those which, if showing any change, taper very slowly but nearly uniformly from one extremity to the other; a defect which can easily be allowed for in the subsequent graduation of the instrument. A bulb is blown on one end of the selected tube: large, if the instrument is meant to be very delicate; small, if a common instrument is to be made, or one which will work through a great range of temperature. The bulb is heated to expand the contained air, and then the open end of the tube is plunged into alcohol, usually tinged with coloring matter, for greater visibility. As the bulb cools, the atmospheric pressure on the alcohol in the vessel forces some of it into the stem, and perhaps a little into the bulb. The tube being then inverted, a few dexterous taps suffice to shake the greater part of the alcohol into the bulb. The lamp is again applied, with caution, until the alcohol boils, and the rapidly escaping vapor drives the air almost entirely from the tube, whose open end is immediately plunged again into the colored spirit.

Unless the stem be nearly 40 feet in length—and thermometers have been made by Forbes (q. v.) of a length approaching to this for the measurement of underground temperature—the alcohol fills the whole of the ball and stem as soon as the glass has cooled. The bulb is again cautiously heated so that, by the expansion of the spirit, such a portion may be expelled, that when the whole has again cooled, the level of the liquid in the tube may stand near some point previously determined on with reference to the particular employment for which the instrument is destined. Finally, the lamp being again applied to the tube, near the upper surface of the liquid, that portion of the spirit is again made to boil; and while the vapor keeps the free end of the tube clear of air, that end is hermetically sealed; and the glass-blower's part of the work is done. A somewhat similar, but more difficult process has to be gone through if other liquids, such as ether, sulphuric acid, mercury, &c., are employed to fill the bulb; each of these liquids having its own special use in certain philosophical inquiries, as we shall presently see. It only remains that the instrument be *graduated*, so that some definite information may be given by its indications.

In the older thermometers, the scale was arbitrary, so that no comparable readings could be taken by means of different instruments. In the finest modern instruments, also, the scale is usually quite arbitrary, being, in fact, engraved on the tube during the process of calibration above described. But then, by careful observation, certain definite temperatures are measured in terms of this arbitrary scale, so that the value of a degree and the position of some definite zero-point are determined for it, and the result engraved on the tube. These numbers enable us, by an easy calculation, to reduce the observed reading of the fine instrument to its equivalent in some of the standard scales.

At present, we assume, what is very nearly true for mercury at least, that equal increments of bulk correspond to equal increments of temperature. All, then, that is necessary is to fix two definite temperatures, and assign their positions on our scale. Water being one of the most common bodies in nature, and being everywhere easily obtainable in a state of great purity, is usually employed; and its *freezing* and *boiling* points are taken as the definite points. The temperature of freezing water or of melting ice is almost absolutely fixed, for (see HEAT) pressure alters it only very slightly. It is otherwise with the boiling-point of pure water, for this is considerably raised by increase of pressure; so much so, in fact, that if the barometer be not attended to, an error of several degrees is possible. Hence we must define the particular pressure, usually 30 inches, at which the boiling-point is to be determined.

The thermometer, constructed (so far) as above described is to have its bulb, and nearly the whole of the portion of the stem which contains liquid, immersed in pounded ice, from which the melted portion is freely trickling; and when the level of the spirit has become stationary, its position, the *freezing-point*, is marked on the tube. Similarly, the barometer, standing at 30 inches, the bulb is enclosed in the steam immediately above the surface of water freely boiling. We thus obtain the *boiling-point*. It only remains that we decide by what numbers these points shall be indicated, because (on account of the nearly uniform expansion of mercury) then the remaining divisions can be at once filled in by dividing the interval between them into equal parts, or, if necessary, allowing for a slight taper in the tube. The only scales which require mention are those of Fahrenheit, Réaumur, and Celsius. Of these, the first is commonly used in Britain, the second in Germany, and the third in France; but this last, under the name of the *Centigrade* scale, is almost exclusively used by scientific men of all nations. The relations of these scales will be easily understood by means of the following figure:



In the Fahrenheit scale, the freezing-point is 32°, and the boiling point 212°, so that the space between these is divided into 212 — 32, or 180, equal parts or degrees. In the others, the freezing-point is the zero, but the boiling-point is 80° and 100° respectively. It is of course perfectly easy to reduce from one of these scales to another. Thus—What is the Centigrade reading for 77° F.? (see the dotted line in the figure). The numbers in Fahrenheit's scale are all too great by 32°, because 32°, and not 0°, stands for the freezing-point. Subtract this from 77, and we have 45. Hence the required number of Centigrade degrees must bear the same ratio to the 100 from freezing to boiling in that scale that the 45 bears to the 180 degrees between the same limits in Fahrenheit's. The requisite number is therefore $\frac{45}{180}100 = 25°$C. In words—*To convert Fahrenheit to Centigrade, subtract* 32, *and multiply by* $\frac{100}{180}$, *or* $\frac{5}{9}$. Vice versâ—*To pass from Centigrade to Fahrenheit, multiply by* $\frac{9}{5}$, *and add* 32. Thus the Fahrenheit value of 50 C is $\frac{9}{5}$ 50+ 32=122, as in the figure. Of course the similar processes with Réaumur's scale present no difficulty.

It is supposed that Fahrenheit fixed his zero at the point of greatest cold that he had observed, possibly in Iceland, more probably by means of a freezing mixture, such as snow and salt, or salammoniac. It is much to be desired that the Centigrade scale alone were employed.

A mercurial thermometer ceases to be of use for temperatures only a little above the freezing-point of mercury; but it has a wide range upwards, as mercury does not boil till about 600° C. On the other hand, a spirit-thermometer, though of little use beyond about 50° or 60° C., as alcohol boils at 70° C., is useful for any degree of cold yet produced, as alcohol has never yet been frozen. When extreme sensitiveness is required, ether being considerably more expansible than alcohol, is sometimes employed; as by Thomson in detecting the effect of pressure on the freezing-point of water. Water, again, would be about the very worst substance with which a thermometer could be filled; for not to speak of its expanding in the act of freezing, and therefore necessarily bursting the instrument, if it were ever allowed to reach the freezing-point, its scale would read partly backwards and partly forwards; for as ice-cold water is gradually heated up to 4° C., it contracts, and begins to expand again after that limit has been passed.

To make thermometers self-recording, various schemes have been proposed, of which we shall notice only one or two. Those most commonly used indicate only the *maximum* and *minimum* temperature during each 24 hours; or during the interval which has elapsed since they were last set. The usual arrangement consists of two thermometers, a mercurial and a spirit one, fixed horizontally to the same frame, with their bulbs at opposite ends of the frame. Above the mercury is a small piece of steel or ivory, and *in* the spirit a small and light float of glass or enamel. Capillary forces prevent the steel from entering the mercury, and the enamel from leaving the spirit. As the mercury expands, it pushes the steel before it, and when it again contracts, it leaves it behind; the end nearest the mercury thus remaining at the highest or maximum indication which that thermometer has given. In the spirit-thermometer, the liquid, as it expands, freely passes the enamel, and leaves it undisturbed; but it can never contract so as to leave it dry. It therefore pulls the enamel back when it contracts, and thus the extremity furthest from the bulb marks the lowest point which the spirit has reached, or the minimum temperature. To set this instrument, incline it so that the steel falls back to the surface of the mercury—the enamel at the same time comes to the surface of the spirit.

The best mode of registration is undoubtedly the photographic. For this purpose, a mercurial thermometer is placed vertically before a narrow slit, in such a way that no light can pass through the slit save above the level of the mercury in the tube. A gas flame is kept burning at some distance in front of the slit, the bulb of the thermometer being protected from its radiation; and behind the slit, a sheet of prepared photographic paper is exposed to the narrow line of light which passes above the mercury. This paper is fixed on a cylinder with a vertical axis, which is made to revolve uniformly by clockwork. Lines are drawn by the clockwork on the paper, giving the position of the slit at each hour of the 24, or the gas-flame is mechanically reduced or eclipsed at intervals of an hour; so that the record, when photographically developed, gives the temperature for every minute of the day and night, in a form represented below; where the blackened space represents the portion of the paper which has been exposed to the light. To find from such a record what was the temperature at any hour, say, 5 hours 30 minutes A.M., draw a vertical (dotted) line, as in the figure, half-way between the V and VI lines, and from the point where it meets the dark space, draw a horizontal (dotted) line. This intersects the scale (to the left in the figure) at 36°, the temperature required.

Among ordinary meteorological instruments, the *wet-bulb* thermometer is deserving of notice. It is simply an ordinary thermometer, with the bulb covered with paper or cotton-wool, kept constantly moist by the capillary action of a few fibres connecting it with a small vessel of water. If the air be *saturated* with moisture (see DEW, EVAPORATION), there will be no evaporation, and the wet-bulb thermometer will give the same indication as the dry-bulb. But the drier and the warmer the air is, the faster does the water evaporate, and (the latent heat of vaporization being mainly taken from the moist bulb) the lower does the mercury sink in the moist-bulb instrument. The difference between the readings of the two instruments, compared with the actual temperature, as shown by the dry-bulb, thus leads to a determination of the hygrometric state of the air.

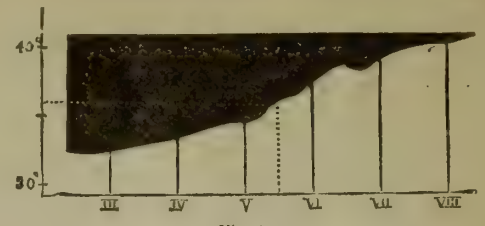


Fig. 1.

So far, we have spoken of the instruments now in common use. But the *air*-thermometer was probably the oldest form; and possesses a scientific superiority over those just described. Theoretical and experimental investigations, connected with the modern Dynamical Theory of Heat (see FORCE, HEAT), show that equal increments of heat produce almost exactly equal changes of bulk in a nearly perfect gas, such as air, if the pressure to which it is exposed be constant. Hence, temperature, as measured by an air-thermometer, gives a true indication of the quantity of energy present in the form of heat. As the comparison of an air-thermometer with a mercurial one shows that, for temperatures not greater than 300° C., or 572° F., the indications of the two agree very closely, the ordinary mercurial thermometer practically possesses within these limits the same advantage.

As the pressure of a gas depends on the amount of heat it contains, the *absolute zero* of temperature, or the temperature of a body wholly deprived of heat, may be determined by finding the temperature at which a perfect gas would cease to exert pressure. For ordinary temperatures, it is found (see HEAT) that air increases in bulk by ·3665, and hydrogen by ·3668 of its bulk, when heated under constant pressure from 0° to 100° C. Again, by Boyle's law, if the air be compressed again, at constant temperature 100° C., to the bulk it had at 0° C., its pressure is increased by ·3665 of its former amount. Thus, p_0 being the pressure at temperature 0° C., p^t that at $t°$ C., we have, when the volume is kept constant,

$$pt = p_0(1 + \cdot003665t).$$

If we assume this to hold for all temperatures, pt vanishes when

$$1 + \cdot003665t = 0;$$
$$\text{or } t° = -274° \text{ C. very nearly.}$$

That is to say, at 274° C. under the freezing-point of water, a perfect gas ceases to exert pressure on its containing vessel—i. e., is deprived of that thermal energy on which pressure depends.

The air-thermometers in common use are affected by the pressure, as well as the temperature, of the atmosphere. To avoid this inconvenience, Leslie and Rumford in the present century revived the *Differential Thermometer* of Sturmius. This instrument, in one of its many forms, is represented in fig. 2. Here a bulb is blown at *each* end of the tube (which is bent into a U-form), and the liquid in the stem is used merely as an index, both balls being full of air. The length of the column of fluid is usually adjusted so that it can just fill one of the vertical arms and the horizontal portion of the tube; and the quantities of air in the two balls are so adjusted, that the column will take this position *when the two balls are at the same temperature*. If the ball A be heated more than B, the liquid index will take a new position, such as CD, and this is read off by a scale applied to either of the vertical arms. The graduation of this instrument may be effected by calculation, but it is usually done experimentally. Leslie made good use of it in his investigations on heat; and, with various adjuncts, such as coloring the glass of the ball A, while that of B was left white; silvering or gilding one of the balls; covering one of them with

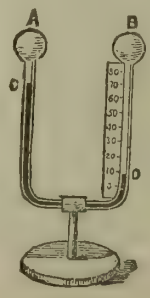

Fig. 2.

moist silk or linen, &c., this instrument became in his hands a *Photometer*, an *Æthrioscope*, a *Hygrometer*, &c.

To thermometers which depend for their action on the expansion of solids, the name PYROMETER (q. v.) is frequently given; but that of Bréguet, as delicate as a good ordinary mercurial thermometer, is not alluded to in that article. The principle of this very beautiful instrument may easily be explained thus. In bending a slip of wood, the fibres on the convex side are necessarily more extended than those towards the concave side. Conversely, if the fibres on one side of a slip of wood were to expand more than those on the other, the slip would bend. Bréguet solders together two thin strips of gold and platinum, or platinum and silver; for portability and concentration bends the compound strip into a helix, fixes its upper end, and attaches a horizontal index to the lower end. The least change of temperature in the surrounding air changes the length of one side of the compound slip more than the other, and the helix twists or untwists through an angle very nearly proportional to the change of temperature.

For measuring radiant heat, the most delicate instrument is the thermo-multiplier. See THERMO-ELECTRICITY.

THERMO'PYLÆ (literally, 'the hot gates'), a famous pass leading from Thessaly into Locris, and the only road by which an invading army can penetrate from northern into southern Greece. It lies south of the present course of the river Spercheius, between Mount Œta and what was anciently an impassable morass bordering on the Maliac Gulf. In the pass are several hot springs, from which T. probably received the first part of its name. T. has won an eternal celebrity as the scene of the heroic death of Leonidas (q. v.) and his 300 Spartans in their attempt to stem the tide of Persian invasion (480 B.C.). Again, in 279 B. C., Brennus, at the head of a Gallic host, succeeded, through the same treachery that had secured a victory to Xerxes, in forcing the united Greeks to withdraw from the pass.

THERSI'TÉS, son of Agrius, whom Homer, in the *Iliad*, makes the ugliest and most impudent talker among the Greeks before Troy. His name in antiquity was a synonym for dastardy and malevolent impudence. The later poets say that he was slain by Achilles for calumniating him.

THESAU'RUS. See DICTIONARY.

THE'SEUS, one of the most celebrated personages of the Greek heroic age. The legend of his career is differently told, but he is usually said to have been the son of Ægeus, king of Athens, by Æthra, daughter of Pittheus, king of Troezen. He was brought up at the court of his maternal grandfather, and, on reaching manhood, proceeded to his father's residence at Athens. On his way thither, he performed several famous exploits, such as the destruction of Periphetes, Sinis, Phæa, the Krommyonian sow, Skiron, Kerkyon, and the fell robber Prokrustes. See PROCRUSTES. After his arrival, Media sought to poison him, but her plot failed. Ægeus recognized his son, and Media and the sons of Pallas were banished. The next feats of T. were the capture of the Marathonian bull, and the deliverance of Athens from its dreadful tribute of youths and maidens to the Cretan Minotaur (q. v.), in which he was assisted by the Cretan princess, Ariadne (q. v.). On his return to Athens, his father Ægeus destroyed himself, and T. succeeded to the throne. In his new capacity of ruler, he displayed no less wisdom than he had formerly shown heroism. To him the legend ascribes the consolidation of the twelve petty commonwealths of Attica into one state, an event that certainly did occur at some period of Attic history, which was commemorated by the festival of the *Synœkia*. T. also reorganized the Athenaic festival, and re-named it the Pan-Athenaic, founded the Isthmian games, and many other institutions; but soon after, the craving for his old stirring life returned, and having laid down his authority, he set out along with Herakles in quest of new adventures. They fought the Amazons, and T. carried off their queen, Antiope or Hippolyte, by whom he had a son.

After the death of Antiope, he married Phædra. The legend makes him take part in the Argonautic expedition by a ludicrous anachronism, join in the Calydonian hunt, help Peirithous and the Lapithæ against the Centaurs, and assist in the attempt to rescue Persephone from the lower world (which led to a long imprisonment there, from which he was delivered by Herakles). Returning to Athens, he found that the minds of the people had been prejudiced against him during his absence, and as he could not re-establish his authority, he withdrew to Skyros, where he was treacherously destroyed by King Lykomedes. What grain of historical fact may lie in the myth of T. it is hard to say. One of the most brilliant figures of the heroic age, reminding us, by his valor, wisdom, and generous love of the fair sex, of a knight of chivalry, we are loath to yield him up as a victim to the ravenous maw of criticism; yet all that can be said for his historic reality is, that so finished and admirable a prince is more likely to have been a legendary tradition of some real hero of primeval times, than a mere creature of the poetic imagination.

THE'SIS, a Greek term, strictly signifies a 'placing' or 'setting'—e. g., Pindar's *epéon thesis* (Ode iii. 14—the 'arrangement of words' in verse; but subsequently was employed by the philosophers (Aristotle, &c.) to denote an intellectual position that had to be maintained. This is the sense in which the word was understood by the scholastics of the middle ages.

THESMOPHO'RIA, a famous festival anciently celebrated in different parts of Greece, but especially in Attica, in honor of Demeter, as the *Thesmophoros* or 'law-giving' goddess, inasmuch as, by the introduction of agriculture, she gave the first impulse to civil society, and more especially to the honorable bond of marriage. The Thesmophoria lasted three days, from the 11th of the month Pyanepsion (October). Only married women could take part in the ceremonies. After certain preliminary purifications (among which abstinence from sexual intercourse was prominent), the women inaugurated the solemnity by marching in procession from Athens to Eleusis, where the night was spent in celebrating the mysteries of the goddess. The next day, called *nesteia*, or the 'day of fasting,' was spent in mourning. The women sat for a while on the ground around the statue of Demeter, and ate nothing but cakes made of sesame and honey. They next proceeded barefooted to the Thesmophorion or temple of Demeter, where they deposited their mystical offerings to the goddess. On the third day, called *Kalligeneia* in honor of Demeter as the 'mother of beautiful offspring,' fasting was exchanged for merriment, jollity, and raillery.

THE'SPIS. See DRAMA.

THESSALO'NIANS, FIRST EPISTLE TO THE, one of the earliest epistles of St. Paul—perhaps the very earliest—was probably written at Corinth about the close of the year 52 A.D., and seems to have been occasioned by the 'good tidings' which Timothy brought him of the 'faith and charity' displayed by his Macedonian converts. It may be divided into two portions, a *narrative* and a *hortatory;* the former embracing the first three chapters, and terminating with a prayer for the Thessalonians, the latter the remaining two. From the narrative portion we derive much important and deeply interesting information regarding the 'Church of the Thessalonians;' but perhaps its great value consists in the picture it presents to us of the apostle himself—'bold in God,' yet 'gentle, even as a nurse cherisheth her children;' scorning to use 'flattering words,' or to 'seek glory' from an assertion of his apostolic dignity; nay, in the excess of a noble pride, 'laboring night and day because he would not be chargeable unto any.' The Epistle is conspicuous for the absence of the ordinary doctrinal element; even the word 'justification,' it has been remarked, does not once occur: on the other hand, it is penetrated with a deep conviction of the nearness of the second coming of Christ, and with an undefined fear lest, in spite of all his labors, the 'tempter' (probably, in this case, the Hellenistic Jews of Thessalonica) should seduce the Thessalonian Christians from the 'faith.' Schrader (*Apostel Paulus*) was the first to impugn the genuineness of the Epistle. He was followed in the same line by Baur; but their opinions have met with little favor among scholars of any party.—See Lünemann in Meyer's *Commentary*, Jowett's (2d ed. 1859) and Ellicott's (3d ed. 1866) *Commentaries*.

THESSALONIANS, SECOND EPISTLE TO THE, was likewise written at Corinth, and in all probability not long after the first. It is generally thought to have been occasioned by the misapprehension of the apostle's meaning on the subject of the coming of Christ to judgment, to which the previous letter had given rise, although Hug and others consider the expression, 'be not troubled. . . . by letter, *as from us*' (chap. ii. 2), as indicating that somebody had forged an epistle in Paul's name; and it is scarcely possible to interpret the passage at the close of the letter, 'The salutation of Paul with mine own hand, which is the token in every epistle: so I write' (chap. iii. 17), otherwise than as a precaution against forgery. From its contents, we gather that adversaries of the apostle had been at work among his Macedonian converts, and that they had not scrupled to misrepresent his teaching, particularly on the great topic above mentioned. Who they were, we cannot be sure, but it is probable that they were Jews or Judaizing Christians. They must have obtained a considerable measure of success in their nefarious enterprise, for we are distinctly aware of a sharper and more imperious tone in the language of Paul. He now teaches more precisely that Christ could not come until the antagonistic forces in human or diabolic society had made themselves more prominent, and done their worst. The genuineness of this Epistle is as certain as that of the first. See the commentaries previously mentioned.

THESSALONI'CA. See SALONIKI.

THE'SSALY, the largest division of ancient Greece, lay to the south of Macedonia and the east of Epirus, being separated from the latter by Mount Pindus, and from the former

by the Cambunian Mountains, the Ægean Sea bounding it on the east, and the Maliac Gulf and Mount Œta on the south. T. proper is a vast plain shut in on every side by mountains; on the N. and W. by those already named, on the S. by Mount Othrys, and on the E. by Mounts Pelion and Ossa, the only opening being the Vale of Tempe in the north-east, between Ossa and Olympus. The plain of T. is said at one time to have been a vast lake, the waters of which found an outlet by the Vale of Tempe. This plain is drained chiefly by the river Peneius (now *Salambria*), which traverses the country in a north-east direction, and its tributaries, and is the most fertile in all Greece, producing in ancient times abundance of corn and cattle, and a breed of horses considered the finest in Greece.

History.—T. was originally called Æolia, indicating that the country was at one time inhabited by Æolians, who, however, were either expelled (proceeding south, and taking up their residence in Bœotia, &c.) or reduced to slavery by immigrants from the more rugged region of Epirus about 1000 B.C. As in Laconia, the inhabitants of T. appear to have been divided into three classes —1. There were the Epirote conquerors, who became rich landed proprietors; 2. Those descendants of the original inhabitants, who, although dependent on the nobles, yet possessed a few privileges —corresponding to the Laconian Perioeci; and 3. The Penestæ, or those of the original inhabitants who had been reduced to serfdom, and who cultivated the lands of their conquerors, corresponding to the Helots, although, on the whole, their condition was better. These latter frequently rebelled against their masters, who were very frequently at war among themselves. Each of the four districts into which T. proper was divided was regulated by a council of its own, but they were occasionally united under a Tagus or president, whose power and time of office appear to have been indefinite. The government, from an early time, appears to have been oligarchical in the separate cities—of which Pharsalus, Larissa, Heracleum, and Pheræ were the chief—the principal power being in the hands of the two great families of the Aleuads and Scopads, famous for their hospitality and encouragement of poets and artists.

T., however, never played any important part in Grecian history, and it was only after the end of the Peloponnesian war that it exercised any influence on the affairs of Greece. About 374 B.C. Jason, tyrant of Pheræ, was elected Tagus of all T. The rule of Jason's successors became so unbearable, that aid was sought from Philip of Macedon, who in 344 subjected the country to Macedonia. T. remained subject to the Macedonian kings, till the victory of Cynoscephalæ, in 197 B.C., brought it under the protection of Rome. Under the emperors, T. was united with Macedonia, but after Constantine it was a separate province. In 1204 A.D., with other portions of the Eastern Empire it came under the dominion of the Venetians, and in 1355 was taken by the Turks. The restoration to Greece of T. south of the Salambria was recommended by the Berlin Congress in 1878; and subsequently various modifications of the Greco-Turkish frontiers were proposed, the Greeks endeavoring to secure the cession of the whole of T. War between Greece and Turkey seemed imminent; but in 1881 Turkey agreed to cede, and Greece to accept Thessaly south of the ridge of mountains forming the watershed of the Salambria (the ancient Peneus), by much the largest and most fertile section of the province.

THE'TFORD, a municipal and parliamentary borough and market-town of Norfolk, on the Little Ouse, 95 miles north-north-east of London by the Great Eastern. Malting is carried on to a considerable extent, and there is some trade on the Ouse, which is navigable up to this point. There are remains of a Cluniac priory, and of other religious edifices. Pop. (1881) 4034. The borough was disfranchised by the reform bill of 1867.

At T., which is a very ancient town, a synod was held in 669; and two centuries later, in 870, it was taken and sacked by the Danes.

THE'TIS, daugther of Nereus and Doris, was married against her will by the gods to Peleus, by whom she became the mother of Achilles. She dwelt in the depths of the sea with her father, and had, like Proteus, the power of changing her shape. Her hand is said to have been sought by Poseidon and Zeus, who gave up the pursuit on Themis declaring that the son of T. would be greater than his father.

THIAN-SHAN, or CELESTIAL MOUNTAINS, a great mountain-system, consisting of several ridges, mostly parallel, in Central Asia, are situated to the south and east of Lake Issykkul, in lat. about 42° N. They are said to extend in an east-north-east direction from the vicinity of Samarkand, to long. about 96° E.—a distance of 1500 miles. As this range, however, was never visited by any European till P. Semenof, commissioned by the Imperial Russian Geographical Society, explored a part of it in 1858, little has been actually ascertained regarding its character and dimensions. It is one of the four great ranges, trending in a general direction from west to east, which traverse Central Asia—and these respectively are the Altaï-Sayan, or Altaïan Mountains, in lat. about 50° N.; the T. Mountains, lat. about 42° N.; the Kuen-lun system, lat. about 36° N.; and the Himalaya Mountains (q. v.). In long. 76°—79° E., the T. Mountains are divided into two great, nearly parallel ridges, and enclose between them a deep valley, about 15 miles in average breadth, through which the river Narin—the chief head-water of the Sir-Daria—flows in a west-south-west direction. East of these ranges, the mountains are known as the Tengri-Tagh; and of this subdivision, the chief peak is the Tengri-Khan (i. e., Spectre-Prince), in lat. 42° 23′ N., long. 79° 40′ E., and which rises to the height of 21,000 feet. East from the Tengri-Tagh, the T. Mountains continue in a double chain, and at an average height of 11,330 feet. In long. 90° E. is the volcano Pe-shan, which is believed to have been in activity prior to the 7th century; and in the vicinity are several other volcanoes. These are remarkable as the only instances of volcanic fires at so great a distance—1500 miles—from the sea. In long. 88° E. is the huge mountain-mass of Bogdo-Oola, perhaps the culminating point of the whole system, and certainly the peak on which there is the greatest accumulation of snow. There are several passes of from 10,000 to 13,000 feet in height.

THICK-KNEE (*Oedicnemus*), a genus of birds of the family *Charadriadæ*, most nearly allied to the plovers, although, from their comparatively large size, they have often been ranked with bustards. They differ from the true plovers in having both mandibles inflated towards the tip, and not merely the upper mandible. There are about half a dozen species. Only one occurs in Britain, the COMMON T. (*O crepitans*), also known as the Thick-kneed Plover, Thick-kneed Bustard, Great Plover, Norfolk Plover, and Stone Curlew.

THIELT, a town of Belgium, in the province of West Flanders, 16 miles south-south-east of Bruges. It is a well-built town, containing several interesting edifices and institutions. An important linen market takes place here annually, and the principal manufactures are linen, woollen, and cotton goods, gloves, vinegar, beer, and tobacco. Pop. (1876) 10,209.

THIERRY, JACQUES NICHOLAS AUGUSTIN, an eminent French historian, was born at Blois on the 10th May 1795. He received his education in the normal school of his native town, and became a teacher in a provincial school. In 1814, he resigned this charge, came to Paris, and published his first work, entitled *De la Réorganisation de la Société Européenne*. In this treatise he considers the practicability of having one government for the whole of Europe, preserving at the same time the nationality of each people. Adopting the views of St. Simon, T. became the assistant of that philosopher, in which capacity he worked for three years. In 1817, he joined Comte and Dunoyer as editors of the *Censeur Européen*, in which he wrote many articles, literary, political, and historical. In 1820, he became engaged on the *Courrier Français*, in which he published his *Dix Lettres sur l'Histoire de France*. He now began to addict himself almost exclusively to historical writing. Having given up the *Courrier*, he published his masterpiece, *L'Histoire de la Conquête d'Angleterre par les Normands* in 1825, and his *Lettres sur l'Histoire* (1827), works which had great success; but this success was dearly bought, as the necessary labor seems to have ruined the eyesight of the author. Becoming quite blind in 1830, he went in that year to Hyéres for the benefit of his health. Here he met Julie de Quérengal, an authoress of considerable repute, whom he married in the following year.

He seems to have been able partially to resume work about this time, and in 1835 he published his *Dix Ans d'Etudes Historiques*, the introduction to which is one of the most eloquent of his works. In 1840 appeared his *Récits des Temps Mérovingiens*, which work gained the great Gobert prize. The preface gives an interesting and eloquent account of the history of his own literary labors. His last publication was the *Essai sur l'Histoire de la Formation et de Progrès du Tiers Etat*, in 1853. The author died 22d May 1856, his wife having predeceased him in 1844. During his life T. enjoyed the success and popularity due to his industry and talents. His careful research has thrown much light on the early ages of which he has written, and dispelled much popular error regarding them. He is second to no French historian of the present day.

THIERS, LOUIS ADOLPHE, French historian and statesman, was born April 16, 1797, at Marseille. His father is variously reported to have been a locksmith, a decayed cloth-merchant, or an advocate at the parliament of Marseille; his mother belonged to an old commercial family which had fallen into poverty. He was placed by his mother's relatives in the Lyceum, where he achieved many victories over his young competitors. In 1815 he was sent to Aix to pursue the study of the law. Here he formed his friendship with M. Mignet the historian, in company with whom, as soon as he had taken his degree as advocate, he set off to Paris to seek his fortune. He lived for a time in obscurity and indigence, but obtaining an introduction to Lafitte, he was enrolled among

the contributors to the *Constitutionnel*, then the leading Liberal organ.

He became distinguished for the vigor and hardihood of his articles, and as in France the occupation of a journalist was at that time, and for many years afterwards, regarded with an estimation proportioned to its influence over society, the young political writer was admitted into the most brilliant circles of the Opposition. In the crowded saloons of Lafitte, Casimir Perier, the Comte de Flahault, the Baron Louis (the great financier of the era), and of M. de Talleyrand, he enjoyed an intercourse with actors in the grand revolutionary drama, which was eminently useful to him in the great undertaking which he had long meditated. *L'Histoire de la Révolution Française* at once placed the briefless advocate and young political writer in the highest ranks of literary celebrity. Three editions were soon called for, and the profits upon the sale, and the gift of a share in the *Constitutionnel*, conferred upon him by an admirer, raised him to comparative affluence. Leaving his garret in the alley of Montesquieu, he emerged into fame, and became one of the most prominent men of France in the two paramount fields of literature and politics. In January 1830, he established a new paper of more democratic principles, the *National*. Assisted by Armand Carrel and some of the ablest men of the Liberal party, T., in this journal, waged unrelenting war against the Polignac administration, which at length, stung beyond endurance, took the desperate measure of issuing the ordinances of July. The revolution of 1830 was the result.

T. now devoted himself to a public career, and was appointed Secretary-General to the Minister of Finance, and elected deputy for the town of Aix. His first appearance in the Chamber of Deputies gave no promise of his subsequent distinction. His diminutive person, his small face, encumbered with a pair of huge spectacles, and his whole exterior presenting something of the ludicrous, the new deputy, full of the impassioned eloquence of the revolutionary orators, attempted to impart the thrilling emotions recorded of Mirabeau. The attempt provoked derision, but soon subsiding into the oratory natural to him—simple, easy, vigorous, rapid, anecdotic—he became one of the most formidable of parliamentary champions. From 1832, when the Soult cabinet was constructed, he continued a minister, with one short interval, until 1836. He was by turns Minister of the Interior, Minister of Commerce and Public Works, and Minister for Foreign Affairs under various chiefs—Soult, Gérard, Mortier, and Broglie. In February 1836, he was nominated President of the Council and Foreign Minister by Louis Philippe. He only held this office until August 1836, when he passed into Opposition. In 1840, he was again called by the king to the premiership. He refused Lord Palmerston's invitation to enter into an alliance with England, Austria, and Prussia for the preservation of the integrity of the Ottoman Empire, from some lingering sympathy with the principles which dictated the first Napoleon's invasion of Egypt and Syria, and a desire to accomplish by diplomatic relations with Mehemet Ali that which Bonaparte had sought to effect by force of arms—a controlling power on the part of France in Syrian and Egyptian affairs.

Lord Palmerston entered into the treaty without France, Acre was taken by the English fleet, and Mehemet Ali was driven out of Syria. The popular irritation in France fostered by T. was excessive, and nothing but the peaceful character of Louis Philippe prevented the French nation from rushing into a war of defiance to all the powers of Europe. T. alarmed the continent by his threats of setting aside the treatise of 1815, and extending the French frontier to the Rhine. It was computed that he spent not less than £8,000,000 in military and naval demonstrations. The effect of the ill blood thus generated was felt shortly afterwards in the seizure of the Society Islands, and in the remonstrances which the British government saw reason to address to that of France respecting the ill treatment of Mr. Pritchard, their consul at Tahiti. Louis Philippe dismissed his bellicose prime minister, and Europe again tasted the sweets of repose. He employed his leisure in historical pursuits. His *Histoire du Consulat et de l'Empire*, begun in 1845 and completed in 1860, is one of the greatest historical works of the age. At the revolution of 1848, he accepted the Republic, but was banished after the *coup d'etât* of 1851 (see LOUIS NAPOLEON). After a short residence in Switzerland, he was permitted to return to Paris, where he published a continuation of his *History*. He re-entered the Chamber in 1863, having been elected deputy for the department of the Seine by the Liberal opposition.

In his speeches, T. constantly taunted the empire with the loss of foreign *prestige;* and these taunts are not to be left out of record when the disastrous war of 1870 is to be rightly accounted for. When that conflict became inevitable, he predicted the certain defeat to France it would lead to. The early disasters of the war brought him into a particularly prominent position. It was T. who suggested the laying waste of the country around Paris. He declined to become a member of the government of national defence, formed on the downfall of the empire; but voluntarily undertook diplomatic journeys to England, Russia, Austria, and Italy, on behalf of France—a self-appointed mission, in which he was unsuccessful, but by which he acquired the unfeigned gratitude of his countrymen. According to the suggestions of these four neutral powers, T. opened negotiations for peace with the King of Prussia at Versailles; which, however, were for the time unavailing. After the capitulation of Paris, T. was elected to the National Assembly by the vote of a third of the French nation, and was chosen by the Assembly to be head of the Provisional Government. Owing to his good sense, the French accepted the terms of peace offered by Prussia. In 1871, after having crushed the Commune and restored order, he ceased to be 'Chief of the Executive Power' of France, to become 'President of the French Republic;' and this office he held till May 1873, when, failing in his effort to make the republic permanent by definitive legislation, he made way for Marshal MacMahon. His death (5th September 1877) was a severe blow to the republicans of France, whose leaders had latterly come to regard T., though a 'Conservative Republican,' as head of the whole republican party. T. had been a member of the *Académie Française* since 1836.

THIERS, a manufacturing town of France, in the dep. of Puy-de-Dôme. It stands in a pleasant valley, on the right bank of the Durole, 23 miles E.N.E. of Clermont. Its manufactures of cutlery, paper, and playing-cards gave to the town a certain importance in the 17th century. Pop. (1876) 11,182.

THIRD, the name popularly given to a musical interval, or rather to two different musical intervals, which are distinguished as the *major* and *minor* third. The major third is the interval between a note and its mediant, as between C and E; its ratio is 4 to 5, and it comprises four semitones. The minor third has for ratio 5 to 6, as from A to C, and comprises but three semitones.

THIRDS, in Scotch Law, means the share which a widow, on surviving her husband, has in his personal property. During the marriage, his personal property, as well as her own, form one common fund called the goods in communion; and on the death of either, there is a division between the survivor and the children or next of kin. If there are children, they take two-thirds, and the widow takes the remaining third. But if there are no children or descendants of children, she takes one-half.

THI'RLAGE is, in the law of Scotland, a peculiar right or servitude enjoyed by the proprietor of a mill over the neighboring lands, whereby the owner or possessor of such lands is bound to carry the corn grown thereon to be ground at his mill. The miler or owner of the mill is entitled to certain duties from the suckeners, i. e., the possessors of the lands within the thirl or sucken, and these duties are called multures, being a proportion of the grain or flour. Such multures are called insucken multures; while outsucken multures are similar payments made by strangers, who are not bound to send their corn to the mill, but choose to do so. Many nice questions have been raised between proprietors on this subject; but these are technicalities which must sooner or later be abolished, and the whole system is unsuited to the present times. Thirlage is extinguished by the ruin of the mill or by forty years' exemption. In England, there is no similar right, except in some ancient manors where an immemorial custom to a like effect exists.

THIRSK, a parliamentary borough in the North Riding of Yorkshire, on both banks of the Codbeck, an affluent of the Swale, 23 miles north-west of York. It contains an old, large, and handsome Gothic church, and carries on manufactures of leather and saddlery. Pop. (1881) of borough, which returns a member to parliament, 6306.

THIRST is a well-known sensation, resulting from a peculiar state of the mucous membrane of the digestive canal, but especially of the mucous membrane and the fauces, usually caused by an insufficient supply of liquid. In cases of extreme thirst, there is a peculiar sense of clamminess in the mouth and pharynx; which, with the other disagreeable feelings, is almost immediately relieved by the introduction of liquid into the stomach, where it is absorbed by the veins. That the thirst is relieved by the absorption of the fluid, and not by its action as it passes over the mucous membrane, which seems to suffer most, is proved by the facts—(1) that injection of liquids into the stomach through a tube (in cases of wounded œsophagus), and (2) the injection of thin fluids, as water, into the blood, remove the sensation of thirst. An excessive thirst is often an important morbid symptom. It may arise from two very opposite conditions—one a condition of excitement, and the other of depression. Whenever the blood is in a state requiring dilution, and is too stimulating, as in fevers and inflammations, there is thirst; and, again, in cases of excessive secretion and exhaustion, as for example in cholera and in the two forms of diabetes, there is great thirst, which sometimes also attends the lowest stages of prostration in malignant diseases.

When there is a great loss of the watery portion of the blood

by profuse perspiration, caused not by disease, but by hard bodily exercise in a hot atmosphere, as in the case of coal-whippers, mowers and reapers, &c., there is always great thirst and from two to four gallons of beer or cider a day may, in these cases, be taken with impunity, if not with advantage. Cold tea, without milk or sugar, is the most satisfying drink under these circumstances. Independently of disease, great thirst may be induced by the use of salted meat or fish, highly-peppered curries, and other stimulating dishes, the ingestion of malt liquors drugged with salt and more pernicious matters, or of gin strengthened by sulphuric acid, &c. In all these cases, the symptoms point to the natural remedy.

THIRTY TYRANTS, at Athens, were a body of rulers invested with sovereign power after the close of the Peloponnesian war. They were all native Athenians, but members of the aristocratical party, and chosen by the Spartan conquerors, who, knowing the animosity existing between the democracy and oligarchy of Athens, hoped to rule the city through the agency of the latter. Their government was a positive 'reign of terror,' marked by the most infamous cruelties. Even Mitford, with all his hatred of democracy, speaks of the 'shamelessness of crime' as surpassing all that had previously occurred in Grecian history. It lasted only one year, when it was overthrown by the return of the Athenian exiles under Thrasybulus.

THIRTY TYRANTS of the Roman Empire, is the collective title given to a set of military usurpers who sprung up in different parts of the empire during the 15 years (253—268 A.D.) occupied by the reigns of Valerian and Gallienus, and amid the wretched confusions of the time, endeavored to establish themselves as independent princes. The name is borrowed from the Thirty Tyrants at Athens, but, in reality, historians can only reckon nineteen—Cyriades, Macrianus, Balista, Odenathus, and Zenobia, *in the East;* Postumus, Lollianus, Victorinus and his mother Victoria, Marius, and Tetricus, *in the West;* Ingenuus, Regillianus, and Aureolus, in Illyricum and the countries about the Danube; Saturninus, in Pontus; Trebellianus, in Isauria; Piso, in Thessaly; Valens, in Achaia; Æmilianus, in Egypt; and Celsus, in Africa.—See Niebuhr's *Lectures on Roman History*, and Gibbon's *Decline and Fall of the Roman Empire.*

THIRTY YEARS' WAR was not properly one war, but rather an uninterrupted succession of wars (1618—1648) in Germany, in which Austria, the most of the Catholic princes of Germany, and Spain, were engaged on one side throughout, but against different antagonists. This long-continued strife had its origin in the quarrels between the Catholics and Protestants of Germany, and the attempts of the former, who were the more powerful body, to deprive the latter of what liberty of worship they had obtained. The severe measures taken by the emperor, the head of the Catholic party, against the Protestant religion, led also to strictures on their civil rights; and it was to protect their political as well as their religious liberties, that the Protestants formed a union, 4th May 1608, with Frederick IV., the Elector Palatine, at its head. The rival union of the Catholic powers, under the leadership of the Duke of Bavaria, followed 11th July 1609.

In Bohemia, the immense preponderance in numbers (two out of three) and influence of the Protestants, had forced from their Austrian king an edict of toleration (11th July 1609), which was at first faithfully observed; but during the reign of Matthias, sundry violations of it were made with impunity; and as the influence of Ferdinand of Styria (see FERDINAND II), his successor, began to be felt in more flagrant partiality to the Catholics, the kingdom became a scene of wild excitement; three of the Catholic party were thrown from the window of the Bohemian council chamber at Prague, and ultimately Ferdinand was deposed, and Frederick V., the Elector Palatine, chosen in his stead (1619); and Count Thurn, at the head of an insurgent army, repeatedly routed the imperial troops, and actually besieged the emperor in Vienna. The Catholic princes, though as apprehensive as their opponents of the encroaching policy of Austria, crowded to the emperor's aid; and while the Protestant union and James I. of Great Britain held aloof from Frederick, whose sole allies were Bohemians (under Thurn), Moravians, Hungarians, and a Piedmontese contingent of 3000 (under Count Mansfeld), a well-appointed army of 30,000, under Duke Maximilian, advanced to support the Austrians, and totally routed Frederick's motley array at Weissenberg (8th November 1620, near Prague, afterwards reducing the Upper, while an army of Spaniards under Spinola ravaged the Lower Palatinate, and the Saxons (in alliance with the emperor) occupied Lusatia. The Bohemians were now subjected to the most frightful tyranny and persecution; a similar policy, though of a more moderate character, was adopted towards the people of the Palatinate—the Protestant union standing aloof, and subsequently dissolving, through sheer terror. But the indomitable pertinacity and excellent leadership of Count Mansfeld and Christian of Brunswick, two famous partisan leaders who ravaged the territories of the Catholic league, and the forced cession to Bethlem Gabor of large portions of Hungary and Transylvania, did much to equalize the success of the antagonistic parties.

Here the war might have ended; but the fearful tyranny of Ferdinand over all the Protestants in his dominions (Hungary excepted), drove them to despair, and the war advanced to its second phase. Christian IV. of Denmark, smarting under some injuries inflicted on him by the emperor, and aided by a British subsidy, came to the aid of his German co-religionists in 1624, and being joined by Mansfeld and Christian of Brunswick, advanced into Lower Saxony, while the emperor, hampered by the political jealousy of the Catholic league, was unable to oppose him. But when, by the aid of Wallenstein (q. v.), a powerful and effective army had been obtained, and the leaguers under Tilly, in co-operation with it, had marched northwards, the rout of the Danes by Tilly at Lutter (17th August 1626), and of Mansfeld by Wallenstein at Dessau (1st, 11th, and 25th April 1626) again prostrated the Protestants' hopes in the dust; yet a gleam of comfort was obtained from the victorious raid of Mansfeld through Silecia, Moravia, and Hungary, though his scheme for an insurrection in Hungary failed, and his death soon after, at Zara, freed the emperor from a formidable and irreconcilable enemy. The combined imperialists and leaguers meantime had overrun North Germany and continental Denmark, and ultimately compelled King Christian to conclude the humiliating peace of Lübeck (12th May 1629). This second great success seems to have turned Ferdinand's head, for not content with a still more rigorous treatment of the Protestants, and the promulgation of the *Restitution Edict*, which seriously offended even the Catholics, he stirred up Poland against Sweden, and insulted Gustavus Adolphus, both personally and in the persons of his ambassadors—insolent impertinences which he soon saw bitter reasons to regret. The Catholic league now forced him to reduce his army, and supplant Wallenstein by Tilly; while France was inciting Gustavus to the willing task of aiding the Protestants in Germany.

The war entered its third phase by the landing of the Swedes at Usedom (June 1630), and their conquest of Pomerania and Mecklenburg. Gustavus, by the exercise of a little wholesome pressure, induced the elector of Brandenburg to aid him; and though unable to save Magdeburg (q. v.), he marched to join the Saxons, completely routed Tilly at Breitenfeld (17th September 1631); victoriously traversed the Main and Rhine valleys; again routed Tilly on the Lech (5th April 1632), and entered Munich. By the judicious strategy of Wallenstein, he was, however, compelled to return to Saxony, where he gained the great victory of Lützen (q. v.); but his death, depriving the Protestants of the only man who could force the confederate powers to preserve unity of action, was a severe blow to their cause; though the genius and indefatigable zeal of his chancellor, Oxenstierna, and the brilliant talents of the Swedish generals, preserved the advantages they had gained, till the crushing defeat of Bernard of Weimar at Nordlingen (6th September 1634), again restored to the emperor a preponderating influence in Germany. Saxony now made peace at Prague (30th May 1635), obtaining such satisfactory terms for the Lutherans, that the treaty was within three months adhered to by all the German princes of that sect, and the Calvinists were left to their fate.

Final success now appeared to demand only one more strenuous effort on the part of Austria; but Oxenstierna, resolved to preserve to Sweden her German acquisitions, propitiated Richelieu (q. v.), by resigning to him the direction of the war; and the conflict advanced into its final and most extended phase. The emperor, allied for offence and defence with the Lutherans, was now also assailed through his ally, Spain, who was attacked on her own frontier, in the Netherlands, and in Italy; Bernard of Weimar fighting independently, with the view of obtaining Alsace for himself, opposed the leaguers; while the Swedes, under Baner, held North Germany, and by frequent flying marches into Silesia and Bohemia, distracted their opponents, and prevented them, after their successes over Duke Bernard, from proceeding with the invasion of France. The great victory of Baner over the Austrians and Saxons at Wittstock (4th October 1636), restored to Sweden the victor's wreath she had lost two years before; and from this time, especially under Torstensohn (q. v.) and Konigsmark, the Swedes were always successful, adding a second victory of Breitenfeld (2d November 1642), one at Yankowitz (14th February 1645), and numberless ones of less note, to their already long list of successes, carrying devastation and ruin into the hereditary territories, even to the gates of Vienna, defeating the best generals of the empire, till, from a profound feeling of inability to check them, the Austrians hardly dared appear to the north of the Danube. On the Rhine, the leaguers at first had great success—the Weimar troops, now in French pay, were almost exterminated at Duttlingen (24th November 1643); but after the Spanish power had been thoroughly broken in the Netherlands by Condé, the French were reinforced on the Rhine, and under

Condé and Turenne (q. v.), rolled back the leaguers through the Palatinate and Bavaria, and revenged at Nordlingen (3d August 1645) the former defeat of the Swedes. The emperor was now deserted by all his allies except the Duke of Bavaria, whose territories were already mostly in the hands of Turenne and Wrangel; and a combined invasion of Austria from the west and north was on the point of being executed, when, after seven years of diplomatic shuffling with an eye to the changing fortunes of the contest, the Peace of Westphalia (q. v.) put an end to this terrible struggle.

THISTLE (*Carduus*), a genus of plants of the natural order *Compositæ*, sub-order *Cynarocephalæ*, with spinous leaves, imbricated involucres, and heads of flowers, consisting of tubular hermaphrodite florets alone, very rarely dicœcious, stamens free, pappus deciduous, the receptacle having chaffy bristles. The flowers are sometimes large, generally purple, rarely white or yellowish. Recent botanists have divided this genus into two genera—the true T. (*Carduus*), in which the pappus is composed of simple hairs, and the Plume T. (*Cirsium* or *Cnicus*), in which the pappus is feathery.—The species of both genera are numerous, and are found in most of the temperate and cold parts of the northern hemisphere, annual, biennial, and perennial herbaceous plants of considerable size.—The MILK T. (*Carduus Marianus*), a biennial, native of Britain, and other parts of Europe, attains a height of 4—6 feet, and is remarkable for the milky veins of its large waved leaves. The bracteæ of the involucre are subfoliaceous and recurved. The young leaves are sometimes used as a spring salad. Blanched leaves are used in winter salads. They are also used as a boiled vegetable, along with the young stalks, after these have been peeled and soaked in water to extract part of their bitterness. The root is used as salsafy. In former times, the plant was frequently cultivated.—The creeping Plume T. (*Cirsium arvense*, or *Cnicus arvensis*), a species about 1—3 feet high, with creeping roots, pinnatifid leaves and numerous dicœcious flowers, is a very troublesome weed in fields, very common in Britain, and now too common, not only in Europe, where it is indigenous, but in America and other countries to which it has found its way. *Cirsium lanceolatum* and *C. palustre*, both common British plants, are also regarded as troublesome weeds. The former has larger flowers than any of the other species common in Britain. *Cirsium oleraceum* is a native of the north of Europe, but not of Britain, distinguished by its yellowish flowers, which are surrounded with large yellowish involucral bracteæ. The young leaves are used as a culinary esculent.—The BLESSED T. (*Carduus benedictus* of the pharmacopœias, *Cnicus benedictus* or *Cirsium benedictum* of modern botanists) is a native of the Levant and of Persia, resembling in appearance a *Centaurea*, with yellow flowers enveloped in leaves, and abounding in a gossamer-like down. The whole plant has a very bitter and disagreeable taste, and, besides a bitter extractive, contains much sulphate and muriate of potash and sulphate of lime. It is a powerful laxative-tonic medicine, and a strong decoction of it readily induces vomiting.—The COTTON T. (*Onopordon*) is a distinct genus, known by its receptacles being destitute of bristles, and coarsely and deeply honey-combed. The common Cotton T. (*O. acanthium*), a native of Europe, and found in England, but rarely wild in Scotland, if, indeed, it is a true native of that country, is, nevertheless, very generally called by gardeners and others the SCOTCH THISTLE. The national emblem of Scotland is not, in all probablity, any one species of thistle in particular, as botanically distinguished; though the Stemless T. (*Cnicus acaulis*, or *Cirsium acaule*) is in many districts of Scotland so designated.

Stemless Thistle (*Cnicus acaulis*).

According to the common tradition, the Danes (or Norsemen?) came upon the Scots unperceived in the dead of night; and, halting while their spies were trying to discover the undefended points of their opponent's camp, one of the spies chanced to tread upon a thistle of this species, and the loud imprecation which the sudden pain evoked aroused the unsuspecting Scots, who at once attacked the invaders, gained a complete victory, and dubbed the plant which had been the means of their success, the Scotch Thistle. The Cotton T. has large elliptic leaves, and a broadly winged stem. The young fleshy root and the stem, whilst still tender, are in many places boiled and eaten. The expressed juice of the plant was formerly reckoned good for cancerous sores and cutaneous eruptions.—Plants of the genus *Silybum*, distinguished by its monadelphous stamens, and of the genus *Echinops*, which has a very different manner of growth, and belongs to a very different section of the *Compositæ*, are often to be seen in flower-gardens, where they are known as Thistles. The name is also, generally with some addition, very often bestowed upon many plants which have little resemblance to any of these, except in their spinous character. *Centaurea Calcitrapa* is commonly known as the STAR T. (see CENTAUREA).—The CARLINE T. (*Carlina vulgaris*) is pretty common in dry hilly pastures in some parts of Britain.

THISTLE, ORDER OF THE, called also the Order of St. Andrew (q. v.). The following is a more complete account of the institution of the order than is given in the article referred to: The order is of no very ancient date. The earliest-known mention of the thistle as the national badge of Scotland is in the inventory of the effects of James III., who probably adopted it as an appropriate illustration of the royal motto, *In defence*. Thistles occur on the coins of James IV., Mary, James V., and James VI.; and on those of James VI. they are for the first time accompanied by the motto, *Nemo me impune lacesset*. A collar of thistles appears on the gold bonnet-pieces of James V. of 1539; and the royal ensigns, as depicted in Sir David Lindsay's armorial register of 1542,

Star, Collar, and Badge of the Order of the Thistle.

are surrounded by a collar formed entirely of gold thistles, with an oval badge attached. This collar, however, was a mere device until the institution, or, as it is generally but inaccurately called, the revival of the order of the Thistle by James VII. (II. of England), which took place on May 29, 1687. Statutes were issued, and eight knights nominated by James; but the patent for the institution of the order never passed the Great Seal. After falling entirely into abeyance during the reign of William and Mary, the order was revived by Queen Anne, December 31, 1703.

THISTLEWOOD CONSPIRACY, a conspiracy formed in 1820 by Arthur Thistlewood, a man of profligate habits, and a few other adventurers of desperate fortunes, to overturn the government of Britain, and assassinate the ministers of the crown. The opportunity was to be taken of the funeral of George III., when all the military would have left London for Windsor, to take possession of London, and plunder the shops. The ministers were to be massacred when assembled at a cabinet dinner, and the pieces of cannon in Gray's Inn Lane and the Artillery Ground were at the same time to be seized. A provisional government was to be established, and means taken to intercept communication with Windsor and Woolwich, and prevent any one from leaving England by sea. The conspirators were surprised, and most of them apprehended by the police in the garret in Cato Street, where their meetings were held, on February 23, the same day which had been fixed for the massacre of the ministers. A few turned king's evidence against the rest; and Thistlewood and four others suffered the penalty which the law annexed to treason.

THO'LEN, an island in the Netherlands, province of Zeeland, bounded on the S. by the Easter Scheldt, contains about 34,000 acres of rich land, and is defended from floods by strong dykes, the borders of which are planted with trees. Pop. 14,078. Wheat, rye, barley, oats, beans, and potatoes are extensively

grown. The annual produce of madder reaches a million of pounds-weight, and of flax, 400.000. Horses, cattle, sheep, and swine are kept in large numbers. Tholen, the chief town, with a pop. of 2540, is situated in the south-east corner of the island.

THOLUCK, Friedr. Aug. Gottreu, a German Protestant theologian, whose reputation is perhaps greater in England and America than at home, was born at Breslau, March 30, 1799, and studied, first, at the university of his native city, and afterwards at Berlin, where oriental studies claimed his special regard, the first-fruits of which was his *Suffismus sive Theosophia Persarum Pantheistica* (Berl. 1821). The state of his religious opinions may be conceived from his own confession, that when he left Breslau, he thought nearly as much of Mohammedanism as of Christianity. The influence of Neander, however, and still more of Baron von Kottwitz, a philanthropic Christian nobleman of Silesia, produced a radical change in his convictions and modes of thought, and as early as 1823, he appeared as a champion of evangelical doctrines in his *Wahre Weihe des Zweiflers* (True Consecration of the Sceptic; 7th ed. published at Hamb. 1851, under the title of *The Doctrine of Sin and the Propitiator*, and translated into English, French, Danish, Swedish, and Dutch). Next year he published his *Auslegung des Briefs an die Römer* (Exposition of the Epistle to the Romans; Berl. 1824; 4th ed. 1842; also translated into English and other languages). About the same time he was appointed Extraordinary Professor of Theology at Berlin; and in 1825, he paid a visit to England. On his return, in 1826, he succeeded Knapp as Ordinary Professor of Theology at Halle, where, with the exception of a brief official sojourn at Rome, he has ever since remained. T.'s position at Halle was far from pleasant at first, for the majority of the theological faculty, among whom was Gesenius, were very decided rationalists, and did all in their power to make the new professor miserable; but the latter, though not a man of very powerful intellect, was filled with a quiet, earnest, resolute *faith*, and he continued his evangelical labors in spite of all opposition, until they were crowned with success. The university of Halle is at present, mainly owing to T., as thoroughly Christian, though not, perhaps, so strictly orthodox as it was in the days of Francke. His kindness (and that of his wife) towards students, especially *poor* students, is proverbial, and has contributed not a little to his fame abroad. In 1843 he was chosen a member of the Consistory of Magdeburg, where he became Superior Councillor in 1867.

Besides the works already mentioned, we may specify among his exegetical writings his *Praktischer Commentar zu den Psalmen* (Practical Commentary on the Psalms; Hamb. 1843); *Commentar zum Evangelium Johannis* (Commentary on the Gospel of John; 6th ed., Hamb. 1844); *Commentar zum Briefe an die Hebräer* (Commentary on the Epistle to the Hebrews; 3d ed. Hamb. 1850; and *Philosophisch theologische Auslegung der Bergpredigte* (Philosophico-theological Exposition of the Sermon on the Mount; 3d ed. Hamb 1845). Of his dogmatic writings, the principal are contained in the *Literarischer Anzeiger für Christliche Theologie und Wissenschaft*, a journal now discontinued; and in his *Glaubwürdigkeit der Evang. Geschichte* (Credibility of the Gospel History; Hamb. 1837), a treatise directed against Strauss's *Leben Jesu*. Among his contributions to history of theology, are to be reckoned his *Vermischte Schriften grösstentheils apologetischen Inhalts* (2 vols., Hamb. 1839); *Der Geist der Luth. Theologen Wittenbergs im* 17 *Jahr* (The Spirit of the Lutheran Theologians of Wittenberg in the 17th Century; Hamb. 1852); *Das Academische Leben des* 17 *Jahrh.* (The Academic Life of the 17th Century; Halle, 1853—1854); and his *Geschichte des Rationalismus* (History of Rationalism), of which several parts—notably a *Vorgeschichte des Rationalismus*—have already appeared, but which is still unfinished. Besides these may be mentioned several volumes of sermons. T. died at Halle, 9th June 1877.

THO'MAS, St., one of the most westerly of the group of Virgin Islands, is situated in lat. 18° 20′ N. long. 65° W.; area (*Almanach de Gotha*, 1879), 33 square miles; population about 14,000. It belongs to Denmark.

The interior of the island is mountainous, and not very fertile. Since the emancipation of slaves in 1847, the cultivation of sugar has been entirely abandoned. Cotton is planted, but only in small quantity. The climate is hot, dry, and unhealthy; yellow fever is endemic, and preys much upon Europeans, the natives being seldom affected by it.

The principal town, Charlotte Amalie, is situated on the side of the mountain, and descends nearly to the margin of the harbor. The houses, which appear from the harbor tier above tier, and have a beautiful and picturesque effect, are built of a bright cream-colored limestone, surrounded with balconies, verandahs, and jalousies, fancifully painted, and the roof covered with galvanized iron or shingles (the latter gaily colored when brightened up with the rays of a tropical sun), and presenting at night, when lighted up with lamps, a very striking effect. The town itself is laid out with rather narrow streets, but there are some good stores and hotels in the place. The governor's house, to the east of the town, is a large and imposing building; and an ancient ruin, 'Blue Beard's Castle,' crowns an elevation. The harbor is land-locked on three sides; the entrance to it, fortified on both sides, is rather narrow. The harbor is spacious, and has deep water, is much occupied with shipping of many nations, and has been much improved since 1864 by dredging. The Royal Mail Steam-packet Company have made it a central station for their large steamers, from whence the intercolonial steamers diverge on their different routes through the adjoining seas. About 750 British vessels of all kinds, exclusive of ships of war and mail-packets, enter the harbor annually. The average annual value of the imports, exclusive of coal, is about £1,000,000.

THOMAS, Christians of St., a remarkable religious community settled from a very early date on the Malabar coast of the Indian peninsula. They take their name from the apostle St. Thomas, who, according to a very ancient tradition, for which, however, no very positive evidence or satisfactory authority can be alleged, preached in India, and is regarded as the apostle of that country. As early as the 6th c., the well-known voyager, Cosmas Indicopleustes, reports of numerous Christian communities settled in India, under the pastoral care of bishops sent from Persia. To this circumstance it may be attributed that the Indian Christians, like those of what may be called the mother church of the Persian kingdom, lapsed into the Nestorian heresy, which, after the decrees of Ephesus and Chalcedon, having been suppressed by the civil laws of the Roman Empire, was driven beyond the limits of Roman authority, and found its most favored seat among the hostile Persians. Once established among the people, these opinions continued to be professed by the Christians who survived in those regions the vicissitudes of the revolutions of which India in medieval times was the scene. Their seat was almost entirely along the Malabar coast, and extended from the south cape, Comorin, as far as Calicut; and they are found scattered throughout this length over the whole space from the western declivity of the Ghauts to the sea. From the time of their lapsing into Nestorianism, their bishops were ordained by the Nestorian patriarch of Babylon, and they possessed certain civil rights under the successive dynasties which ruled in the south of India. On the whole, however, they were much oppressed; and on the arrival of the Portuguese in 1598, the Christians of St. T., although Nestorians, regarded them as their deliverers.

Nevertheless, the diversity of creed was at once recognized by the western missionaries, and attempts were made by the successive bodies of missionaries, Franciscans, Dominicans, and finally Jesuits, to reconcile them to the Roman Church. A union, more or less real, was effected by a synod held at Diamper in 1599; and one of the Jesuit Fathers, Padre Roz, was named bishop in 1601. This union, however, was not lasting; they fell away once again from the Roman communion, and the expulsion of the Portuguese from Cochin by the Dutch completed the disruption. A considerable number of them, however, were again united to Rome through the missionaries of the Carmelite order; and towards the close of the 17th c., the Emperor Leopold I. obtained the leave of the Dutch to send a bishop and twelve priests of that order to the Malabar coast. One of the most serious impediments to the influence of those missionaries, as well with the schismatics as with the heathen, was found in the intrigues and jealousies of the Portuguese. In later times, the Christians of St. T. have for the most part been absorbed in the native Christian population. Their tenets were in the main those of the Nestorians of Chaldea and Mesopotamia, about the precise details of which much controversy has prevailed, and many conflicting statements have been made, according to the religious views of the various travelers or missionaries who have reported regarding them. Much of this conflict of testimony arises from a confusion of names rather than of things. See Nestorians.

THOMASIUS, Christian, a German philosopher and jurist, was born at Leipzig, 1st January 1655, studied at Frankfurt-on-the-Oder (1675—1679), and returning to his native town, commenced to lecture on law in a style perfectly free from the pedantry of the schools. In 1687, to the astonishment of his Latin-speaking colleagues, he adopted the German language as the vehicle of his expositions, published his programme for the following year in the same tongue, and commenced a monthly journal under the very German title of *Freimüthige, lustige und ernsthafte, jedoch vernunft- und gesetzmässige Gedanken oder Monatsgespräche über allerhand vornehmlich aber neue Bücher* (Honest, Merry, Sincere, yet Rational and Moderate Thoughts, or Monthly Talk concerning all Sorts of Books, but especially New Ones). This work, however, excited so much opposition that he was forced to leave Leipzig, and went first to Berlin, and afterwards (1690) to Halle, where, under the patronage of the Brandenburg court, his lectures were the means of establishing a university, since famous. In this university T. became Professor of Jurisprudence, and here he died, 23d September 1728. The great aim of T. was to harmonize and blend science and life;

hence his contempt for hair-splitting subtleties of which nothing could be made; his preference for the use of German rather than Latin in his academic lectures; his disinclination to all philosophical terminology, his depreciation of the school-men, &c. But more particularly he was among the first who insisted on dissociating natural right from morality, and in connection therewith, honorably signalized himself as a courageous opponent of trial for witchcraft and punishment by torture. The characteristic features of his mode of thought are contained in his *Vernünftige und Christliche aber nicht scheinheilige Gedanke und Erinnerungen über allerhand auserlesene, gemischte, philosophische und juristische Händel* (Rational and Christian, but not pretendedly Pious Thoughts and Recollections concerning sundry Choice, Mixed, Philosophical, and Juristic Transactions, 3 vols., Halle, 1723—1726; and in his *Geschichte der Weisheit und Thorheit* (History of Wisdom and Folly).—See Luden, *Christian Thomasius nach seinen Schicksalen und Schriften* (Berl. 1805).

THO'MASTON, a town and port of Maine, U. S., on the St. George River, 15 miles from the coast, and 80 miles east-north-east from Portland. Its extensive granite quarries are worked by the convicts of the state prison; 300,000 casks of lime are exported annually; registered shipping, 60,000 tons; 5 churches, 2 public libraries. Pop. (1870) 3092.

THO'MISTS. See AQUINAS.

THOMSON, JAMES, author of *The Seasons*, was born on the 11th September 1700, at Ednam, in Roxburghshire, of which parish his father was minister. He was put to school at Jedburgh, and afterwards sent to complete his education at Edinburgh. His intention was to enter the church, and he went through a full course of study with that object in view. His views, however, changed. From a very early age, he had been wont to express himself in verse; and in 1725 he betook himself to London, to seek fame and fortune as a poet. Almost his sole capital for the enterprise seems to have been his manuscript poem of *Winter*. This, with some little delay and difficulty, he disposed of to a publisher for three guineas; and as its success was not instant, his outlook was by no means brilliant. Gradually, however, the merits of the poem were recognized; successive editions were called for; friends and patrons were not wanting to the young author; and in no long time T. found himself as good as a made man and poet. The *Winter* was followed in 1727 by the poem *Summer; Spring* was published the year after; and *Autumn*, completing *The Seasons*, appeared in 1730, with a reissue of the previous portions. In 1729, T. produced the tragedy of *Sophonisba;* but though great expectations were formed of it, its success on the stage was but indifferent. A weak line which occurred in it—

O Sophonisba, Sophonisba, O,

as parodied by a wag in the pit into

O Jemmy Thomson, Jemmy Thomson, O,

afforded much merriment to the town, and somewhat killed the pathos of the author, otherwise with not much vitality in it.

During 1730—1733, T. was abroad in Paris and elsewhere with the son of Sir Charles Talbot, the Chancellor; and on his return, at the death of his pupil, the comfortable place was bestowed upon him of Secretary of the Briefs. This he held till it lapsed on the death of the Chancellor in 1737, which left him once more in considerable straits, which were, however, a little alleviated by a pension of £100 a year given him by the Prince of Wales. His tragedy of *Agamemnon*, produced in 1738, was, in Johnson's phrase, 'only endured, but not favored;' and his poem on *Liberty*, by himself considered his greatest work, was little relished by the public. His *Tancred and Sigismunda*, produced in 1745, was the only one of his tragedies which had any success, and its success was not of a signal kind. About this time, the accession to power of his friend Mr. Lyttleton secured him the office of Surveyor-general of the Leeward Islands, which, however, he did not long live to enjoy. He died of a neglected cold in August 1748, and was buried in the church of Richmond, without an inscription; but a monument was afterwards erected to his memory in Westminster Abbey. In the spring before his death he had published his finest poem, *The Castle of Indolence*. This piece, which is written in the Spenserian stanza, has all the descriptive power and opulence of imagination which distinguish his more popular *Seasons*, while in tone and diction it is much more chastened and harmonious. Together, they continue to maintain for T. a somewhat high place in the roll of British poets. Of his other works, with the exception of the song of *Rule Britannia*, nothing but the names is now remembered. As a man, T. was singularly amiable, and his careless, indolent generosity of disposition seems to have endeared him to all who knew him.

THOMSON, SIR WILLIAM, one of the few very great living mathematicians and natural philosophers, was born in June 1824. His father was Professor of Mathematics in the university of Glasgow. T. graduated in 1845, as second wrangler and first Smith's Prizeman at Cambridge, where he was shortly afterwards elected to a fellowship in St. Peter's College; and became Professor of Natural Philosophy in the university of Glasgow in 1846. This appointment he still holds. While still an undergraduate, he published several valuable papers. He was for some time editor of the *Cambridge Mathematical Journal*, and some of his most brilliant discoveries have appeared in its pages. He has also contributed to the *Comptes Rendus*, the Transactions and Proceedings of the Royal Societies of London and Edinburgh, and various other journals. All his numerous writings have the stamp of originality in a marked degree. In the mathematical theories of Elasticity, Vortex-Motion, Heat, Electricity, and Magnetism, he has made remarkable discoveries; among which we need merely mention the Dissipation of Energy, the beautiful idea of Electric Images, and the complete solution of the problem of telegraphing through a submarine cable. Popularly, he is best known by his association with the Atlantic cable, a gigantic idea, which, but for his investigations, might, perhaps, not have been realized, or even attempted. On its successful completion, in 1866, he was knighted. He has invented several excellent and useful instruments for various electrical purposes—such as electrometers and galvanometers; instruments for the determination of electric units in absolute measure, &c. He is a remarkable instance of the combination of the very highest powers of reasoning with the practical skill of the mechanician and engineer. In conjunction with Professor Tait, he published in 1867 the first volume of an extensive *Treatise on Natural Philosophy;* and his *Papers on Electro-statics and Magnetism* (a splendid monument of his genius) were collected and reprinted in 1872.

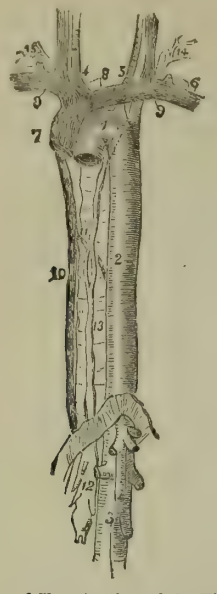
His elder brother, JAMES, Professor of Civil Engineering in Glasgow, has made various improvements in the construction of turbines; and other engines (see WATER-POWER); but is best known by his splendid discovery that the freezing-point of water is lowered by pressure; and the glacier-theory he has founded upon it. See HEAT, ICE, REGELATION.

THOR, the god of thunder, was the son of Odin and Earth (Yörd); his wife was Sif (= *sib*, friendship, love, and thus of the same import with Freyja). His palace, supported on 540 pillars, was called Thrudwanger; here he received the warriors that had fallen in battle. Thunder was caused by the rolling of his chariot, which was drawn by he-goats. He was in the vigor of youth, had a red beard, and was the strongest of all gods and men; the gods even called in his assistance when they were in straits. He was, in particular, a terror to the Giants (q. v.), with whom he was perpetually at strife, and whom he struck down with his hammer Miolnir (i. e., the smasher or mauler), which had the property of returning to his hand after being hurled; it had been made by cunning dwarfs. The sign of the hammer was among the heathen Teutons analogous to that of the cross among Christians. In the contest at the twilight of the gods, T. slew the serpent of Midgard, but fell at the same time poisoned by the venom exhaled from its mouth. The name of T. was widespread. The Saxons worshiped him as Thunar (High-German, *Donar*). Torden, the wrathful deity dreaded by the Lapps, who in his rage hurled down huge blocks from rocks, tore up trees, destroyed cattle and men, is evidently the Scandinavian Thor. The Gallic god Taranis—in an old inscription Tanarus—mentioned by Lucan, appears also to be identical, especially as *torrunn* in the Celtic languages still signifies thunder. The attribute of thunder is intimately associated with the Latin Jupiter and the Greek Zeus (see also INDRA). Of all the Asa-gods, T. had unquestionably the most worshipers. IN Upsala, according to Adam of Bremen, he occupied the place of honor in the temple between Odin and Frikke.

In Norway, T. was the national god, and here, as in Iceland, temples were almost exclusively erected to him. Offerings were made to him, particularly in times of pestilence. On the ground of the superior respect enjoyed by T., and of his being called 'Old Thor,' some place him in opposition to Odin, and consider him historically as an older divinity, only partly supplanted by the Odin doctrine. As rude force is the predominating element in T., the humorous element of the Scandinavian belief attaches to him. Thus, the giants often blinded him by magic, and made fun of him; yet he always shows his extraordinary strength in these cases, and in the long-run his opponents are invariably overcome by the hammer. Thursday is so called from T.; and the name survives in numerous names of places (Thuneresberg, in Westphalia; Thunderhill, in Surrey; Thurso), and also in personal names (Thorburn, in Scand. Thorbiörn).—Compare Uhland, *Der Mythus von Thor* (Stutt. 1836); Grimm, *Deutsche Mythologie*.

THORA'CIC DUCT, a canal equal in diameter to a goose-quill, proceeding from the *Receptaculum Chyli* (into which the contents of the lacteals are collected, and which is situated in the front of the body of the second lumbar vertebra), ascends along the front of the vertebral column, between the aorta and ascending vena cava, as high as the fourth dorsal vertebra; it then inclines to the

left, and passing behind the arch of the aorta, ascends as high as the seventh cervical vertebra, when it bends forwards and downwards, and terminates at the point of union of the subclavian and internal jugular veins of the left side, where it is provided with a



The Course and Termination of the Thoracic Duct.

1, the arch of the aorta; 2, the thoracic aorta; 3, the abdominal aorta; 4, arterior innominata; 5, the left carotid; 6, the left subclavian; 7, the superior vena cava, formed by the union of 8, the two venæ innominatæ; and these by the junction 9, of the internal jugular and subclavian vein at each side; 10, the vena azygos; 12, the receptaculum chyli; 13, the thoracic duct, often dividing in the middle of the thorax into two branches, which soon reunite (the course of the duct behind the great vessels is shown by a dotted line); 14, the duct making its turn downwards before terminating in the veins of the left side; 15, the termination of the trunk of the duct on the right side.—From Wilson's *Anatomist's Vade-mecum.*

pair of semilunar valves, which prevent the admission of venous blood into it. It is also provided with other valves on its upward course. This duct is not liable to any special diseases; but if its function of conveying chyle from its source into the general circulation be interfered with, as, for example, by the pressure of a tumor, the due nutrition of the system must be checked.

THO'RAX. See CHEST.

THORI'NUM, or THO'RIUM (symb. Th; equivalent, in the old system, 57·8; new system, 115·6), is a rare metal, much resembling aluminium, but taking fire considerably below a red heat, and burning with great brilliancy. *Thorina*, or *Thoria*, is supposed to be the protoxide, and is remarkable for its high specific gravity, 9·4. Thorinum was discovered in 1829 by Berzelius in an earth to which he had given the name *Thorina*, and which occurs in a rare black Norwegian mineral termed *Thorite*. None of the compounds of this metal are of any practical importance.

THORN. See CRATÆGUS, HAWTHORN, and SPINE.

THORN (Pol. *Torún*), a strongly-fortified town of Prussia, in the south of the province of West Prussia, on the right bank of the Vistula, 31 miles east-south-east of Bromberg by railway. The town was founded in 1232, was a member of the Hanseatic League, and contains many houses—as the town-hall—remarkable for their beautiful gables and interiors. It is the birthplace of Copernicus, whose monument is to be seen in the *Johannis-Kirche*, and a bronze statue to whom was erected in the market-place in 1853. An active trade in corn and timber is carried on. Pop. (1875) 18,667.

THORN, CONFERENCE OF, one of those efforts to explain away the differences between the several bodies of Christians, with a view to religious reunion, of which the 17th c. furnishes more than one example. The originator of this movement was the king of Poland, Ladislaus IV., who proposed his project for the consideration of a synod of the bishops of his kingdom held at Warsaw in 1643, and letters were addressed in consequence to all the several religious bodies in Poland, inviting them to send delegates to an assembly to be held at Thorn, for the purpose of the mutual explanation of their doctrines, with a view to the removal of all differences of belief. The conference met in October 1645, and was opened in a spirit of moderation; but it soon lapsed into disputation and controversy, and at length broke up without any result, November 21, 1645. The official account of the proceedings of the conference are printed in Calvi's *Historia Syncretistica.*—See also Schröckh's *Kirchengeschichte seit der Reformation*, iv. p. 509.

THORN-APPLE (*Datura*), a genus of plants of the natural order *Solanaceæ*, having a tubular 5-cleft calyx, a large funnel-shaped 5-lobed flower, a 2-laminated stigma, and an imperfectly 4-celled, prickly, or unarmed capsule. The species of this genus are annual herbaceous plants, rarely shrubs or trees; and are in general very narcotic, and productive of excitement or delirium. The common THORN-APPLE, or STRAMONIUM (*D. stramonium*), is an annual plant, with smooth stem and leaves, white flowers, and erect prickly capsules, a native of the East Indies, brought by the gipsies to Europe, where it is now very generaly to be met with, as also in Asia, the north of Africa, and North America. It is by some stated to be the plant from which the poisonous 'dri' of the gipsies is obtained. It contains a peculiar narcotic alkaloid, *Daturine*, and is one of the most powerful narcotic acrid poisons; but its leaves and seeds are employed, although rarely, in medicine. The leaves have an extremely nauseous over-powering smell, and a loathsome bitter taste; the seeds, which are of a dark-brown color, are still more poisonous. A variety with pale violet flowers and purplish violet stem is frequently cultivated in gardens as an ornamental plant.—Still more narcotic is the Soft-haired Thorn-apple (*D. metel*), a native of the south of Asia and of Africa. Robbers in India employ it in order to stupefy those whom they would rob, or rather to throw them into the condition of a waking dream. From its seeds, along with opium, hemp, and certain spices, a strong intoxicating substance is prepared, which the Mohammedans of India use in order to produce in themselves an indescribable joyfulness and extremely pleasurable feeling for a short time; but the use of it destroys the constitution. *D. Tatula*, another Indian species, has similar properties, and is very energetic; as is also *D. sanguinea*, the FLORIPONDIO of Peru, which is used by the Indians to prepare a very powerful narcotic drink, which stupifies when very diluted, and when strong, brings on maniacal excitement.—The beautiful *D. fastuosa*

Common Thorn-apple (*Datura stramonium*).

has flowers externally of a violet color, and white within, and is cultivated as an ornamental plant, especially a variety with what are called double flowers, which consist rather of two corollas, one within the other.—*D. arborea*, a native of Peru and Columbia, has begun to be also very generally cultivated in flower-gardens in Europe. It has very splendid pendulous white flowers, 9—12 inches long, which diffuse a sweet smell in the evening and at night.

THORNBACK (*Raia clavata*), a species of ray or skate, com-

Thornback (*Raia clavata*).

mon on most parts of the British coast. It attains a large size; the muzzle is little produced, and the form is nearly rhombic; the

tail has two small membranous fins near the tip, on the upper central ridge, and a small dilatation at the tip. The upper surface is brown, with lighter spots; the under surface white. The upper surface is rough with small points, and has numerous nail-like crooked spines, each with an oval bony base. The T. is much esteemed for food, particularly in autumn and winter, but is most abundantly captured in spring and summer, when it approaches the shore to deposit its eggs.

THOROUGH BASS. See FIGURED BASS.

THORVALDSEN, BERTEL, one of the greatest of modern sculptors, was born, it is supposed, at Copenhagen, on the 19th November 1770. Neither the place nor the day of his birth, however, can be fixed with absolute certainty; and he himself, when casually questioned as to the last, replied with a certain *brusque* felicity: 'I don't know; but I arrived at Rome on the 8th March 1797;' dating his birth, as it were, from the commencement of his career as an artist. He was the son of a poor ship-carpenter, and his first essays in art were made in the carving of figure-heads in the yard where his father worked. His education was otherwise neglected, so that through life he could but indifferently write or spell; but the genius for art was born with him, and in 1793 he gained the first gold medal for design at the Academy of Copenhagen; and along with it the privilege of three year's residence abroad for the purpose of study. Accordingly, in 1796, he sailed for Rome, arriving there as stated above. After long obscure and patient labor, his talent became conspicuous. From the celebrated Canova, in particular, he had early and generous recognition; and shortly, by the model for his great work, 'Jason,' he secured general admiration. No purchaser could, however, be found for it till, in 1803, just as in hopeless disgust the artist was about to return to Copenhagen, he received from the well-known Thomas Hope an order for its production in marble at a price which might be called munificent. From this time forward, prosperity and fame flowed upon him in full tide. In 1819, he returned to Denmark, taking the overland route, and everywhere on his journey special honor was paid him. His reception in Copenhagen was triumphal, and apartments were assigned him in the palace of Charlottenburg. He remained at home but a year, and at the end of it returned to Rome, where he continued to prosecute his art assiduously, up to 1838, when he left it, intending to pass his remaining years in his native country. Its climate, however, proved no longer suitable to him, and the year 1841 found him once more at Rome.

In 1844, having revisited Copenhagen, he died suddenly there in the theater, of disease of the heart, on the 24th March. All the works remaining in his possession he bequeathed to his country, to be preserved in a museum bearing his name, for the maintenance of which he also left the bulk of his fortune, reserving a sufficient provision for Madame Poulsen, his natural daughter. This magnificent and unique collection is now one of the chief glories of the metropolis of his native country. By his countrymen, he is naturally held in special honor; and their proud verdict, which ranks him the greatest of sculptors since Michael Angelo, is elsewhere more generally acquiesced in than is often the case in such instances of national enthusiasm. Anything like a catalogue of his chief works need not be here attempted. He addicted himself by preference to classical and mythological subjects; but his great works in the cathedral of Copenhagen, 'Christ and the Twelve Apostles,' 'St. John preaching in the Wilderness,' and the 'Procession to Golgotha,' sufficiently prove that he was determined to this preference by no incapacity to appreciate and grandly fulfil the demands of the Christian ideal. Of the many busts from his hand of eminent contemporaries, those of Byron and the great Danish poet Œhlenschläger are perhaps the most notable. The life of T. has been written by Hans Christian Andersen, by J. M. Thiele, and by Eugene Plon. English readers may consult a careful abridgment of M. Thiele's work, by the Rev. M. R. Barnard, published in 1865 by Messrs. Chapman and Hall, London; and a translation of M. Plon's *Life* by Mrs. Cashel Hoey, which appeared in 1874.

THOTH, also called TAUT or THEUTH, the Egyptian Hermes or Mercury, the mythical inventor of the arts and sciences, music and astronomy, and especially of speech and hieroglyphs or letters, over which he was supposed to preside. His name, indeed, meant 'speech,' or 'word,' and he personified the divine Logos, or intellectual power. See HERMES, EGYPT.

THOU, JACQUES AUGUSTE DE, or, as his name is frequently written, Jacobus Augustus Thuanus, son of Christophe de Thou, first president of the Parlément de Paris, was born in that city on the 8th October 1553. He was originally designed for the church, but when old enough to judge for himself, he gave up all thoughts of an ecclesiastical career. In spite of the difficulty presented by a sickly constitution, he pursued both literary and scientific studies with vigor and success. Taking a liking for the writings of Cujacius, he took up his residence at Valence in Dauphiné, where he attended the lectures of the celebrated jurist. At Valence, he made the acquaintance of Scaliger, with whom he maintained an unbroken friendship for the rest of his life. In 1578, he accepted, with reluctance, the office of ecclesiastical councillor of the Parlément of Paris. A firm adherent of royalty, in 1588, he was made councillor of state to Henry III.; and during the rest of the reign of that king, he took a leading part in all public affairs. On the accession of Henry IV., he was made keeper of the royal library. In 1593, he began his great work, the *Historia sui Temporis*, which principally occupied him during the remainder of his life. He took an important part in the arrangement of the Edict of Nantes; but, with this exception, he seems to have given but little attention to public affairs during the reign of Henry IV.; and the death of that monarch, in 1610, may be said completely to have ended his political existence. From 1604, when the first 18 books of the history appeared, the author held the position of first historian of his age. Eighty books appeared during his life; and the remainder, forming in all 138 books, were published in 1620, after the author's death, which took place on the 7th May 1617.

As a historian T. is eminently impartial; so devoid, indeed, did his work show him to be of religious prejudice, that he incurred the imputation of having no religion about which to feel; the consequence being that, in 1609, his work was put into the *Index Expurgatorius*—a fact which appears to have distressed him more than one would have expected. Written in Latin, the author has spared no pains to make it severely classical. It is generally held valuable rather from its workmanship than its material. The best English edition is that by Samuel Buckley, 7 vols. 1733. T. also wrote a number of Latin poems.—See *Autobiography*, ending 1601; also Colinson, *Life of Thuanus* (Lond. 1807).

THOUROUT, a town of Belgium, in the province of West Flanders, 11 miles west-south-west of Bruges. There are manufactures of starch, mustard, hats, and wooden shoes. T. was a place of great commercial importance in the middle ages. Pop. (1880) above 8000.

THRACE, anciently the name of an extensive country bounded on the N. by the Danube, on the E. by the Euxine, on the S. by the Ægean and Macedonia, and on the W. by Macedonia and Illyria. In pre-historical times, however, the name appears to have denoted the whole of eastern Europe north of Greece, including both Macedonia and Scythia; so, at least, one is disposed to understand the fable, that Oceanus had four daughters—Asia, Libya, Europa, and Thracia. It is, on the whole, very mountainous—whence, perhaps, its name T., from *tracheia*, rugged (?)—the principal range being Hæmus (mod. *Balkan*, q. v.), from which three lesser chains branch off in a south-easterly direction, the loftiest being Rhodope, the summits of which reach an elevation of more than 8000 feet. The three most important rivers of T. are the Strymon (mod. *Struma*), which, during the Greek period, formed the boundary between it and Macedonia; the Nestus (mod. *Carasu*); and the Hebrus (mod. *Maritza*, q. v.), the largest—all of which flow southward from Hæmus into the Ægean Sea.

Roughly speaking, ancient T., before the rise of the Macedonian power, comprised the territory now divided by the Turks into the provinces of Rumili and Bulgaria; but subsequently the Romans made the range of Hæmus the northern limit of T., and gave the region between Hæmus and the Danube the name of Mœsia (mod. *Bulgaria*). The climate was considered by the Greeks very severe—even that of Ænos, on the shores of the Ægean, being described by Athenæus as 'eight months of cold and four months of winter;' but it is believed that the ancient accounts are much exaggerated, or are only applied to T. poetically as the *North*, though it is not to be denied that, in the mountainous districts, the frost was often intense—as is still the case. The country was marshy, undrained, and overspread with dense damp forests (of fir, oak, chestnut, &c.), which must have considerably lowered the temperature; but large portions, especially in the south and east, 'such as the great plain of Adrianople and the land towards the lower course of the rivers Nestus and Hebrus,' were very fertile. The chief products were corn, millet, wine, and hemp. Cattle, sheep, horses, and swine were reared in great numbers. The region betwen the Nestus and the Strymon appears to have been infested by lions. Herodotus states that they attacked the baggage-camels of Xerxes on his march; but if this was anciently the case, these formidable animals have long since disappeared. Gold and silver mines were numerous and productive in the same locality, and the acquisition of these was the principal motive for Philip of Macedon's aggressions.

The question has been much discussed, to what race the Thracians belonged, and it cannot be said that it has as yet been satisfactorily settled. It is certain, however, that two different peoples went by this name in early times. It is repeatedly asserted by those writers who treat of the confused medley of tradition and myth which fills up the pre-historical annals of Greece, that a race of 'Thracians' inhabited part of the Hellenic peninsula,

and had even at one time extended themselves as far as Attica. To these pre-historic Thracians belonged, says Strabo, the Muses, and the cultivators of ancient music, Orpheus, Musæus, Thamyris, and Eumolpus; and the grand argument against confounding them with the Thracians of history, is the impossibility of a race so notoriously barbarous as the latter in language and manners, having sprung from the authors of Hellenic literature and art (see Müller's *Hist. of Greek Lit.*, p. 26, *et seq.*). But whether the pre-historic Thracians were properly Hellenes, or 'Pelasgians'—whatever *that* may mean—is indeterminable.

Passing now to the historic Thracians, whom we find settled in the regions north and east of Macedonia, we are again at fault. Of their manners and customs, of their character, and of their later history, we indeed know something; but of their origin and ethnological relations, we cannot be said to know anything. They were not Greeks, for they spoke a language which the latter called barbarous; but if (as Strabo asserts) the Getæ and Daci were branches of the Thracian family, and spoke the same tongue, we may conjecture that, ethnologically, the term 'Thracians' denotes a mixed Illyrico-Scythian race; though it is quite impossible, from want of evidence, to substantiate the conjecture. Herodotus, Xenophon, and Strabo are our chief authorities regarding the habits and practices of the people. From them we learn that they bought their wives, and sold their children. Polygamy was general, and when a husband died, his favorite spouse was slain over his grave. Before marriage the Thracian women enjoyed the utmost liberty; after it, they were guarded with Turkish rigor. War and robbery were the only honorable occupations of the men. They lived to steal, either from each other or from neighboring peoples. When not fighting or plundering, they spent their days in savage idleness, or in quarreling over their cups. Courageous, or rather ferocious, after the fashion of barbarous peoples, they yet lacked the steady valor and endurance of disciplined troops; at all times, their warfare displayed more fierceness and impetuosity than fortitude. Their treachery was probably no greater than that of other barbarians.

The history of T. may be sketched in a few words. The Greeks first became acquainted with the inhabitants when they began to plant colonies on the coasts. Of these, the principal were Byzantium (675 B.C.), Selymbria, Abdera (560 B.C.), Mesembria, Dicæa, Maronea Ænus, Cardia, Sestus, Amphipolisi, &c.; but their want of union—the fatal weakness of Hellenic civilization—hindered them from acquiring that measure of power to which they might have otherwise aspired, and enabled the Thracian chiefs of the interior to preserve their independence. In 513 B.C., Darius, king of Persia, marched through T., on his way to punish the Eupean Scythians, and on his return, left Megabazus, with 80,000 men to subdue the country. In this he partially succeeded, but new disturbances and complications arose between the Persians and Greeks, which resulted (480 B.C.) in the famous expedition of Xerxes, the details of which do not belong to Thracian history. We have only to mention that a consequence of the expulsion of the Persians from Europe was the resumption of liberty and the revival of prosperity among the Greek colonies in Thrace. Shortly before the Peloponnesian War, a native Thracian state—the Odrysian—had attained to great power and eminence under a ruler named Sitalces, who joined the Athenian alliance, but could not, in spite of his resources, prevent the triumph of Sparta in the north as well as in the south. The rise of the Macedonian kingdom, under Philip II. (359 B.C.), destroyed the independence of great part of Thrace. All the region between the Strymon and Nestus was incorporated with Macedonia, and Macedonian garrisons were established further east. Under the government of Lysimachus, the subjugation of T. became complete. On the fall of the Macedonian kingdom (168 B.C.) it passed into the hands of the Romans, and subsequently shared the vicissitudes of the Roman Empire. In 334 A.D., a colony of Sarmatians was planted in T. by Constantine, and in 376, another of Goths by permission of Valens. In 395, it was overrun by Alaric, and in 447, by Attila. In 1353, Amurath obtained possession of all its fortresses, except Constantinople, and it has ever since remained subject to Turkey. But see BULGARIA and ROUMELIA, EASTERN.

THRASHING is the separating of the grain or seeds of plants from the straw or haulm, a process which has been accomplished in different ages and countries by means less or more effective. The first method known to have been practiced was the beating out of the grain from the ears with a stick. An improvement on this method was the practice of the ancient Egyptians and Israelites to spread out the loosened sheaves of grain on a circular piece of hard ground 50—100 feet in diameter, and to drive oxen backwards and forwards over it, so as to tread the grain out; but as this mode was found to damage a portion of the grain, it was partially superseded in later times by the thrashing-sledge (Egypt, *noreg*, cf. Heb. *moreg*), a heavy frame mounted on three rollers, which was dragged over the heaps of sheaves. The use of the stick was, however, retained for thrashing the lighter kinds of grain. Similar methods of thrashing were employed by the Greeks and Romans, the stick (*fustis*, *baculum*, *pertica*), the treading by men or horses, and the thrashing-sledge (*tribulum*) being found in common use among them; but their thrashing-sledge, which is still to be seen in operation in Greece, Asia Minor, Georgia, and Syria, differed from the eastern one by having pieces of iron or sharp flints fastened to the lower side, in place of rollers. The primitive implement in Northern Europe was the stick, and an improved modification of it, the *flail*, has not yet been completely superseded. The flail consists of two sticks loosely fastened together at one end by stout thongs (*caplins*), one stick (the *hand-staff*) is used as a handle by the workman, and by a circular swing round his head he brings down the other stick (the *swiple*) horizontally on the heads of the loosened sheaves spread out on the barn-floor. In the hands of a good workman, this implement is found to perform its work pretty effectively, although slowly.

Various attempts were made to supersede the flail by a machine, but with little success, till 1787, when Andrew Meikle, an ingenious Scotch mechanic, produced a thrashing-mill so perfect, that even after having run the gantlet of nearly a century of improvers, it is essentially the machine of its original inventor. In Meikle's mill, the mode of operation is as follows: The sheaves are loosened and spread out one by one on the feeding-board A (fig. 1), with the ears towards the machine; they are then pushed

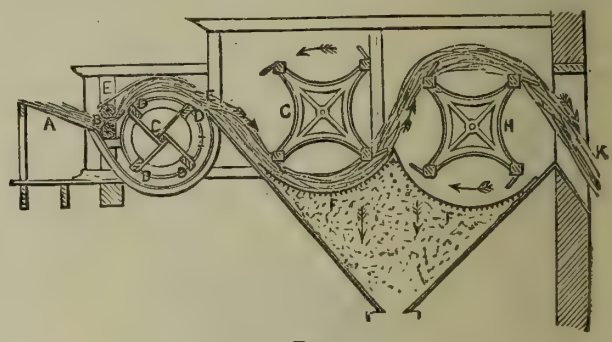


Fig. 1.

forwards till caught between two revolving fluted rollers of cast-iron B, B; and as soon as one sheaf disappears between the rollers, another is presented to them. Behind the rollers is a rapidly revolving *drum* or cylinder C, having four *beaters* D, D, D, D, or spars of wood armed with iron placed along its surface parallel to its axle; and these beaters striking the heads as they are protruded from between the rollers, detach the seeds and husks. Grain and straw then pass together over the cylinder, the former falling through the wire-work F, F, while the straw is carried forward by the circular rakes G, H, and, being by them thoroughly tossed and separated from the grain and chaff, is ejected at K. The grain which has fallen through the wire-work is received into a winnowing-machine, where it is cleansed from chaff, &c., and is then either discharged upon the barn-floor, or, as is the case with the most improved machines, is raised by a series of buckets fixed on an endless web, and again winnowed, to separate the perfect grains from the light and small seeds. Barley is, previous to the second winnowing, subjected to the process of 'hummelling,' by which the awns are removed; but the rest of the process is the same as above.

Since Meikle's invention, the improvements attempted on his mill have been chiefly confined to modifications of the drum; such as diminishing the distance between the drum and its cover, E, E, increasing the number of the beaters, and accelerating the speed of the drum.

The portable thrashing machine, now so generally employed in England and Scotland, has not the two grooved rollers, the loosened sheaf being at once submitted to the action of the thrashing-machinery; the drum, which is a *high-speed drum*, is provided with six beaters, and its cover is capable of being set at any required distance from it by means of screws. A modification of this machine has the drum wide enough to allow of the straw being fed in sideways; the cover encloses the machine for about three-fifths of its circumference; and the straw, after separation from the grain, is delivered by the rakes almost unbroken, and in a condition fit for being at once put up in *bolts*, or bundles, whence this species of drum is called a *bolting-drum*. In another form, the drum is armed with rows of spikes projecting outwards for about 2½ inches, which revolve between similar rows of spikes on the interior of the cover; this kind thrashes effectually, but breaks and chops the straw much more than the other forms of drum.

The attention of inventors and manufacturers of thrashing-machines has not only been turned of late to the question of securing increased speed, but also of providing against the risk of acci-

dents to those employed about the mills. The feeding of those high-speed drums which were getting so common was attended with considerable danger. Within the last few years, however, mills have been constructed, and are working well, with patent self-feeding apparatus. Considerable protection to life seems to have thus been afforded. The self-feeding apparatus consists of a covered hopper containing a shaking-board on which the sheaves are thrown sideways. Through this board, iron spikes curved like a fork or rake move forward and seize the unthrashed grain. A second row of spikes regulates to a nicety the quantity of stuff reaching the drum at a time; and while the shaking-board is falling to let the grain come in contact with the drum, the first row of spikes progresses to catch a fresh supply. Some of the English thrashing-machines fitted up in this way within the last few years thrash from 8 to 10 quarters of grain per hour, and perform their work in every respect satisfactorily.

The driving-power is wind, water, horse-power, or steam; the first of which is so very uncertain and unequal in its operation, that it has nowadays been mostly superseded by the others. Water-power is always desirable, and when it can be had in sufficient quantity or regularly, it is much to be preferred in point of economy, its mode of application to thrashing being either by the ordinary machinery of the Water-wheel (q. v.) or by *Barker's Mill* (q. v.). Horse-power was the agent in most common use in the

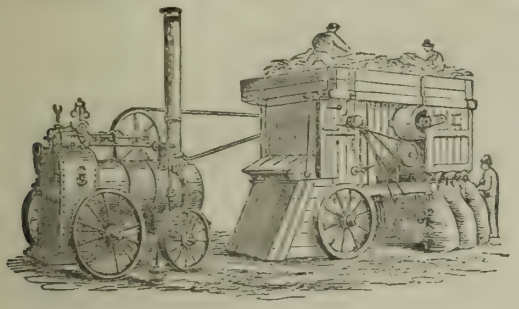

Fig. 2.

earlier days of thrashing-mills, the horses being yoked to beams attached to a vertical revolving shaft which communicated motion by means of bevelled gear to the thrashing-machine. But it was found that this kind of work was very trying for the horses, and interfered considerably with the other work of the farm; and accordingly steam-power, as being more economical, has extensively superseded horse-labor, engines of 4—10 horse-power being generally employed. Portable thrashing mills and engines are very generally employed in England, and to some extent in Scotland, being thought by many to be more economical, from their saving the labor of transporting the crop from the stack to the barn; and from their adaptibility to the requirements of a farmer who may rent more than one holding in a district. On the other hand, however, some prefer the fixed machine on account of cheapness and diminished liability to derangement.

THRA'SIMENE, Lake. See Trasimenus Lacus.

THREAD is an exceedingly small twine made by doubling and twisting several thicknesses of yarn so as to produce a strong and well-rounded line for sewing with, either of cotton, flax, or silk.

THREAD-WORMS. This term is employed by some zoologists to the whole order *Nematoda*—a word derived from the Greek, and signifying a thread-like form. Most writers, however, restrict it to the *Oxyuridæ*, which, in the early part of this work, have been included in the *Ascarides* (q. v.), but have been arranged in a separate family by Cobbold, who divides them into ten genera. Only one species, *Oxyuris vermicularis* (formerly known as *Ascaris vermicularis*) (q. v.), the small thread-worm, infests man, and is the commonest of the intestinal parasites.

THREATS, in a legal sense, are that kind of intimidation which has for its object to influence a person in abandoning or surrendering some legal right, or what is equivalent, paying money, to prevent some injury being done to him. When the threats are made by more than two persons, the offence usually assumes the form of Conspiracy (q. v.). In other cases, the usual form of the offence is the sending of a threatening letter—i. e., a letter either anonymous or otherwise—demanding money from the party addressed; otherwise, that he will be murdered, or his house will be burned, or he will be charged with some infamous crime. Whoever sends, or in directly or directly, with knowledge of the contents, causes to be received, any letter or writing demanding, with menaces, or without any reasonable or probable cause, any property, chattel, money, valuable security, or other valuable thing, is held guilty of felony, and liable to penal servitude for life, or imprisonment for three years. And whoever demands such things with intent to steal the same, is also guilty of felony, with like punishment. So, whoever sends a letter threatening to accuse a person of any crime, with a view or intent to extort money or gain any valuable security or property, is guilty of felony. Whoever threatens to accuse one of an infamous crime, with intent to extort money, or gain some valuable property, is guilty of felony. Whoever sends a letter threatening to burn or destroy any house, barn, building, stack of grain or hay, or to kill or wound cattle, is guilty of felony.

THREE KINGS, Feast of the, a famous medieval festival, identical with Epiphany (q. v.), or Twelfth Night, and designed to commemorate the visit of the three magi or wise men of the East (transformed by the mingled ignorance and reverence of the middle ages into great kings) to the infant Saviour. But the name is more particularly given to a kind of dramatic or spectacular representation of the incidents recorded in the 2d chapter of Matthew—as, the appearance of the wise men in splendid pomp at the court of Herod, the miraculous star, the manger at Bethlehem, the solemn and costly worship of the Babe—which was long very popular. In 1336, a peculiarly gorgeous representation was got up at Milan by the Preaching Friars. See Chambers's *Book of Days*, vol. i., page 62.

THRESHER. See Fox Shark.

THRIFT (*Armeria*), a genus of plants of the natural order *Plumbagineæ*, having the flowers collected into a rounded head, a funnel-shaped dry and membranous calyx, five petals united at the base, five distinct styles, and five stamens attached to the base of the petals. By many botanists it has been regarded as a subdivision of the genus *Statice*, from which it is distinguished chiefly by having the flowers in heads.—The Common Thrift (*A. maritima* or *vulgaris*) is a plant which grows in turf-like tufts, with linear leaves, scapes a few inches high, and beautiful rose-colored flowers, an ornament of the sea-coasts of Britain and of Europe generally, and also frequently found on high mountains. It is often planted in gardens as an edging, for which it is very suitable, being of a fresh green all the year, and exhibiting its fine flowers in profusion in July and August; but it requires to be renewed every two or three years, the smallest rootless sets growing, however, with great readiness in the moist weather of

Common Thrift (*A. maritima*).

spring. The flowers are an active and useful diuretic. From two drachms to an ounce of the flowers freshly gathered and quickly dried, should be gently boiled, and the patient allowed to drink as much of the decoction as he pleases. Some aromatic, as anise or cinnamon, is added.

THRIPS, a genus of small insects of the order *Hemiptera*, suborder *Homoptera*, allied to *Aphis* (q. v.), and included in the family *Amphidii* of some entomologists. The species are numerous and widely distributed. They are very active, and some of them very troublesome, by the injury which they do to cultivated plants, upon the juices of which they live. When disturbed, although they use their wings, their motion resembles leaping rather than flying. The wings are much fringed. A common British species is *T. cerealium*, an insect not a line in length or in extent of wing, which resides in the spathes and husks of cereal grasses, particularly wheat and rye, in the beginning of summer, causing the grain to shrivel; and which at an earlier season of the year, causes the abortion of the ear by puncturing the stems above the joints. It is most injurious to late-sown wheat, probably because

1, *Thrips cerealium* (female); *a*, natural size. 2, do. with wings extended; *b*, natural size.

the plants are weak, and therefore easily injured, at the time when the *Thrips* abounds. The larva is deep yellow, part of the head and two spots on the thorax dusky. The pupa is pale yellow and active. The perfect insect is flat, smooth, and pitch-color. The male is wingless, the female winged.

THROAT, AFFECTIONS OF THE. Common inflammatory sore throat has been already described in the article QUINSY; and other important throat-diseases, Aphthæ or Thrush, and Diphtheria, have also been discussed in special articles. The *malignant sore throat* of the older nosologists is now recognized as a modification of scarlatina. Another important variety of sore throat occurs as one of the forms of secondary syphilis. *Bronchocele* or *Goitre*, which, to a certain degree, is an affection of the throat, is specially described under the latter name.

The disease popularly known as *Clergyman's Sore Throat*, or *Dysphonia Clericorum*, and which is recognized in medicine under the name of *Follicular Inflammation of the Pharynx*, first shows itself by huskiness of the voice, with more or less coughing, hawking, and expectorating, from an uneasy sensation in the throat; there is, moreover, a constant inclination to swallow. On examining the back of the throat, its mucous membrane is seen covered with granulations, caused by an accumulation of secretion in the follicles, which sometimes burst and discharge their contents, which are of an elastic consistent nature. This discharge is occasionally followed by ulceration. The disease commonly arises from too prolonged or powerful exercise of the voice by persons in whom the mucous membrane of the throat is in a relaxed condition. Perfect rest from public speaking, preaching, acting, &c., is of more importance than anything else in the way of treatment, and a residence during the winter and spring in a mild and equable climate is expedient. Torquay, Ventnor, Nice, Mentone, Algiers, and Egypt, afford a choice of suitable residences. Tonics, such as iron, quinia, and strychnia (in small doses not exceeding $\frac{1}{20}$th of a grain, three times a day), should be tried; but the local application of a strong solution of nitrate of silver (from 20 to 80 grains in one ounce of distilled water), applied by a probang to the affected mucous membrane, is usually of far more service than internal remedies. The best work on this subject is that of Dr. Horace Green, an American physician.

Passing over several throat-affections of minor importance, we proceed to the consideration of wounds in the throat. These wounds are comparatively seldom the result of accident; they are more often made with a murderous intent, and most frequently they are made with the view of committing suicide.

The first duty of the surgeon, in treating a case of cut throat, is to arrest the flow of blood. Ligatures should be applied to wounded arteries, and steady pressure with the finger (beneath which a small pad of lint is placed) to wounded veins, such as the external jugular. If the internal jugular is wounded, fatal hæmorrhage will very rapidly ensue, unless the wound is immediately plugged with small pieces of sponge, or pressure with the finger is maintained as long as necessary. With a knowledge of these means of checking hæmorrhage by pressure, an intelligent non-professional person may be the means of saving life. When the bleeding has completely ceased, but not till then, means may be taken for bringing together the edges of the wound. In most cases, sutures, or even adhesive plaster, are inexpedient and even dangerous, and it is best to keep the parts in simple apposition. 'The patient,' says Mr. Gray, 'should be placed in bed in a moderately warm room, the shoulders well raised by pillows, and the head bent forward and retained in that position by a bandage, and the wound should be covered with a strip of wet lint or linen.'

THROMBO'SIS (derived from the Greek *thrombos*, a clot of blood) is a term originally suggested by Virchow, and was generally employed to designate an affection of the blood-vessels (either veins or arteries), which essentially consists in a coagulation of blood (forming a true clot) at a certain fixed spot. Under certain morbid conditions, the blood has a tendency to coagulate in its vessels during life, on the least provocation. Thus, slight pressure on the side of a vein will sometimes induce this coagulation, while in other cases it is due to inflammation of the tissues which surround a vein, or laceration of a vein (as when the placenta is expelled from the uterus). A clot thus formed in a vessel increases and extends from one to another, till it reaches and finally fills a large vessel. Clots of this kind occurring in veins have been noticed from the times of Ambrose Paré and Petit, who seem to have been the first to apply the term *thrombos* to them.

THRO'NDHJEM, or TRONDHJEM (Ger. *Drontheim*), the ancient Nidaros, and former capital of Norway, is situated in the Fjord of T., at the mouth of the little river Nid, 240 miles north of Christiania; pop. (1875) 22,597. T., which consists of the old town, founded in 997, and the suburbs of Blakland and Ilen, is built on the picturesque and undulating slopes of the Nid-Elv, and has regular and broad streets. The fortified islands of Munkholm and Christiansteen defend the capacious harbor, which is never closed by frost on the seaward side. Among the public buildings the most noteworthy are the Kongens-Gaard, or old palace, and St. Olaf's Church, the remains of the old cathedral, now partially restored, built in the 12th century, by Archbishop Oeysteen, who erected this noble Gothic pile on the site of the two early Christian churches which had been founded by Harald Haardrade and Olaf II. The fine western extremity of the nave was not completed till 1248. The body of the murdered St. Olaf was preserved within a costly shrine in the chancel of Christ Church, which ranked as the metropolitan church of Norway, where the kings of Norway have been crowned since the time of Magnus V. (1164). T. is the seat of government for the province and of a bishopric, and has a public exchange, the principal national bank, a public library, museum, various literary and scientific institutions, an institution for the deaf and dumb, an insane asylum, &c. The chief articles of trade are fish, tar, deal, and copper, which is obtained from the neighboring mines of Röros. Salted cod and herrings, which are found in large quantities at the entrance of T. Fjord, are important articles of export. Besides its shipping and coasting trade, T. is the center of considerable manufacturing activity, and has good sugar-refineries, distilleries, &c. The environs of T. are picturesque, and its position is one of considerable attraction, notwithstanding the high northern latitude (63° 25′); while the numerous historical events with which it is associated render it one of the most interesting towns in the Scandinavian kingdoms. The preponderance of wooden houses has somewhat diminished of late years, and the local authorities are endeavoring to enforce the use of stone for building purposes, in consequence of the frequent occurrence of great fires.

THRONE (Gr. *thronos*), the chair of royalty, an ornamented seat raised above the level of the floor on which it stands, often covered with a canopy, and intended for the use of a sovereign or other potentate. From an early period the Asiatic monarchs are represented as enthroned: the same usage of a dignified chair set apart for the sovereign was adopted in Greece, where also it was customary to represent all the greater gods as enthroned. In the middle ages and modern times, the throne has been in all monarchical countries the chair occupied by the sovereign on state occasions. The name of throne was also given, in the early centuries of the Christian church, to the raised seat in the middle of the tribune behind the altar, where the bishop sat surrounded by his clergy. The throne is now a common metaphorical expression for sovereign power and dignity.

THROSTLE. See SPINNING.

THROW, the term applied in Mining to the amount of Dislocation (q. v.) in a vertical direction, produced by a fault in the strata.

THRUSH (*Turdus* or *Merula*), a genus of birds of the family *Merulidæ* or *Turdidæ*, having a bill of moderate size, straight, the upper mandible convex, its point compressed, notched, and slightly curved downwards, the gape furnished with a few hairs; the nostrils near the base of the bill, oval, partly closed by a naked membrane; the first feather of the wing very short, the third and fourth longest; the tarsus longer than the middle toe, the outer toe connected with the middle toe at the base. The species are numerous and widely distributed, some of them inhabiting temperate and even cold countries, and some found only in tropical regions. Some of them are birds of passage, as the fieldfare and redwing. Some are gregarious, particularly in winter, as the species just named; others live solitary or in pairs.

The common British species are the Black-bird (q. v.), Fieldfare (q. v.), Redwing (q. v.), Ring Ouzel (q. v.), Song T., and Missel Thrush.—The SONG T., or THROSTLE (*T. musicus* or *M. musica*),

Song Thrush (*Turdus musicus*).

the mavis of the Scotch, is smaller than the black-bird, its whole length being not quite nine inches. Its plumage is brown, of various finely-mingled shades; the throat, sides of the neck, breast, and flanks yellowish, spotted with dark brown; the belly nearly white, with a few spots of dark brown; a dark brown streak, with a lighter brown streak over it, passing from the bill to the eye. It is found in all parts of Europe, but deserts some of the north-

ern parts in winter, being thus partially a bird of passage. It remains all the year in Britain. It feeds on insects, worms, slugs, snails, berries, and seeds. It often makes its nest in the center of a thick bush or shrub, and sometimes in an open shed. The eggs are usually four or five in number. The male takes part in the work of incubation, and is very attentive in feeding his mate whilst so occupied. The throstle is well known as one of the sweetest songsters of the groves. In captivity, it has been taught simple airs.—The MISSEL T. (*T. viscivorus* or *M. viscivora*) is about 11

Missel Thrush (*Turdus viscivorus*).

inches in entire length, and is the largest and strongest European species of the genus. The plumage is very similar to that of the Song Thrush. The tail is slightly forked, which is not the case in that species. The spots on the belly are more numerous, and black. The song is loud and clear, but not equal to that of the Song T. or of the black-bird. The bird delights in pouring forth its song from the very top of a tall tree. It also very often sings before or during wind and rain, whence it has received the name of Storm-cock. Its nest is generally fixed in the fork of a tree. It is found in almost all parts of Britain where there are woods. Its range extends through great part of Asia; it is found in India. —The WOOD T. (*T. mustelinus* or *M. mustelina*) is abundant in North America in summer, as far north as Hudson's Bay, retiring to tropical and subtropical regions in winter. It is rather smaller than the Song T., and very similar to it. It is of a very shy and retiring disposition. It has a clear but very simple song, which is to be heard in the depths of the forest, far from the haunts of men. Several other species are found in North America. India has some.—A common West Indian species (*T.* or *M. leucogenys*) is familiarly known by the name of Hopping Dick, and is a general favorite from its bold, lively manners, and its sweet song. All the species are in esteem for the table, and the Song T. is much sought for this use in Italy in the season of ripe grapes, when it becomes very fat. Gardeners in Britain well know how troublesome thrushes are where numerous, from their avidity for cherries and small fruit.

THRUSH, known also as *Infantile Sore Mouth*, is essentially a disease of early infancy, although it may occur at any age. Its characteristic symptom is the presence of small roundish white specks or patches on the lining membrane of the cavity of the mouth and throat, on the surface of the tongue, the angles of the lips, &c. These patches, which are termed *aphthæ*, look like minute drops of tallow or fragments of curd, and are formed by elevated portions of epithelium covering a drop of serous fluid; and as the dead epithelium falls off, a raw surface, or a dirty ash-colored spot, is left exposed. In thrush, crops of these little patches commonly succeed one another. These spots render the mouth hot and tender, in consequence of which the act of sucking is accompanied by difficulty and pain. In association with these local symptoms are indications of general constitutional disturbance, such as feverishness, drowsiness, sickness, flatulence, colicky pains, diarrhœa, &c. The stools are green and slimy, and not unfrequently acrid, as may be inferred from redness of the anus being a common symptom. The vomited matters are also green, and have a strongly acid smell, as also has the breath. The complaint sometimes seem to be the result of improper diet, if the child is being brought up by hand, or of unwholesome milk from a diseased or intemperate nurse; of bad ventilation, &c.; but in some cases the cause of the disease is not evident. The disorder usually lasts eight or ten days, and is only attended with danger when the local affection runs into a low form of gangrenous ulceration.' As undue acidity of the stomach seems to be an almost general symptom, the diet should be carefully regulated, and mild *antacids* prescribed. Dr. (now Sir Thomas) Watson specially recommends a mixture of 2 parts of dried carbonate of soda and 1 of gray powder (mercury with chalk), of which from three to five grains may be given thrice daily. As a local application to the patches, honey of borax may be applied with a camel-hair pencil; or a pinch of a mixture of powdered borax and loaf-sugar (1 to 8 or 10) may be placed occasionally on the tongue, and the infant allowed to spread it over the mouth.

THRUSH, or TRUSH, in the horse, consists in inflammation and ulceration of the sensitive surfaces within the frog, giving rise to a fœtid discharge, constituting unsoundness, and usually causing lameness. Want of cleanliness is the chief cause. Daily, when the horse returns to his stable, the foot should be washed out with soap and water, carefully dried, and the fissures filled with mineral tar. If amendment does not speedily ensue, a dressing of calomel should be substituted for the tar several times a week. Ragged or loose portions of the frog may be removed by the knife or scissors.

THUCY'DIDĒS, the great historian of the Peloponnesian War, born of the demus Halimus most probably in 471 B.C., is said to have been the son of Olorus and Hegesipyle, and connected with the family of Cimon. It is stated—on authority equally conjectural, however—that he was instructed in oratory by Antiphon, and in philosophy by Anaxagoras. Certain it is that, Athenian as he was, of good family, and resident in the most cultivated community in Greece, he must have enjoyed a most liberal education. He was further possessed, either by inheritance or by acquisition through marriage, of gold-mines in that part of Thrace lying opposite the island of Thasos. He left a son called Timotheus, and perhaps also a daughter, who is said by some scholars to have written the eighth book of his history. We know from himself that he was one of the sufferers from the terrible plague of Athens, and also one of the few who recovered. We have no direct evidence as to his having displayed in public the oratorical talent which he reveals in his history; but it is certain that he held military command, and that he had under him an Athenian squadron of seven ships at Thasus, 424 B C., when Eucles, who commanded in Amphipolis, solicited his assistance against Brasidas. The expected arrival of a superior force induced Brasidas to offer Amphipolis favorable terms, which were accepted.

T. arrived on the evening of the same day on which Amphipolis had surrendered; and though he prevented Eion, at the mouth of the Strymon, from falling into the enemy's hands, still his failure to save Amphipolis caused him to be sent into exile, probably to avoid the severer punishment which his enemy Cleon, then so popular with the Athenians, was designing for him. Where his exile was spent, is not known. Probably he lived a good deal in the Peloponnesus, if not also in Sicily, as has been inferred from his minute descriptions of Syracuse and its neighborhood. According to his own account, he lived in exile twenty years, and probably returned to Athens about the time when Thrasybulus liberated it, in the beginning of 403. Ancient authorities are all agreed that his end was a violent one, though whether it occurred at Athens or in Thrace, we have no means of ascertaining. The year of his death is generally fixed at 401. Uncertainty also prevails as to the time when he wrote his history. He is supposed, from hints supplied by himself, to have kept a register of the events of the war, from its outbreak to its close. His great work, chronologically divided into winters and summers—each summer and winter making a year—was subsequently re-arranged, probably by Alexandrine critics, into the books and chapters as we now have it; and of these books the eighth (and last) is supposed either to have not been written by him, or to have not received the same careful revision which he bestowed on the previous seven. There is hardly a literary production of which posterity has entertained a more uniformly favorable estimate than the history of Thucydides. This high distinction he owes to his undeviating fidelity and impartiality as a narrator; to the masterly brevity of his style, in which he is content to give in a few simple yet vivid expressions the facts which it must have often taken him weeks or even months to collect, sift, and decide upon; to the sagacity of his political and moral observations, in which he shows the keenest insight into the springs of human action, and the mental nature of man; and to the unrivalled descriptive power exemplified in his account of the plague of Athens, and of the Athenian expedition to Sicily.

Often, indeed, does the modern student of Greek history share the wish of Grote, that the great writer had been a little more communicative on collateral topics, and that some of his sentences had been expanded into paragraphs, and some of his paragraphs into chapters. But this want cannot have been felt by the contemporaries of T., while the fate of other ancient historians warns us that had his work, like theirs, been loser in texture, or less severely perfect, it would not have survived, as it has done, the wearing influence of time, or remained, in its own language, the *ktema es aei*—the 'possession for ever'—it has proved to the world. The best editions are those of Poppo (11 vols., Lps. 1821—1840), of Krüger (2 vols. Berl., 1846—1847), and—at least for historical illustration—of Arnold (3 vols., Oxford, 1830—1835). The best English translation is by Richard Crawley (1874); that of the Rev. Thomas Dale is also good.

THUG (from the Hindustani *thaga*, deceive; hence, literally, a deceiver, a cheat) is the name of a religious fraternity in India, which, professedly in honor of the goddess Kâlî, the wife of S'iva, is addicted to the committal of murders, and chiefly lives upon the plunder obtained from its victims. The name of Thugs is that by which this fraternity is generally known among Europeans in the more northern parts of India. In some provinces to the southward, they are called *Phansigars*, or 'stranglers,' (from the Hindustani *phansi*, a 'noose'). In the Tamil language, their name is *Ari Tulukar*, or 'noosers'; in the Canarese, *Tanti Kalleru*, or 'thieves who use a cat-gut noose;' and in Telugu, *Varla Vandla*, or 'people who use the noose.' In the south of India, they used to live under the protection of the native chieftains, who, on the consideration of a settled contribution, and probably also of a share in the result of their depredations, connived at their practices, which, to the uninitiated, were generally concealed under the guise of an honest industry, especially that of the culture of land.

The proceedings of the Thugs are generally these: Banding together in gangs of from ten to fifty, but sometimes also of a much greater number, they assume the appearance of ordinary traders, traveling, if enabled to do so by their wealth, on horseback, with tents, and all the comforts of opulent merchants; but if this be not possible, also in more humble characters. Each gang has its *Jemadar*, or leader; its *Guru*, or teacher; its *Sothas*, or entrappers; its *Bhuttotes*, or stranglers; and its *Lughaees*, or gravediggers. On arriving at towns or villages, they pretend to meet by accident, and to have no previous acquaintance with one another. Some of the gang are then employed as emissaries to collect information; and when learning that any persons of property are about to undertake a journey, they endeavor to insinuate themselves into their confidence, and usually propose to them, under the plea of safety, or for the sake of society, to travel in their company; or else, they follow them, waiting for the proper opportunity of carrying out their murderous work. The latter is generally perpetrated by throwing round the neck of the victim a rope or cloth, which one of the gang holds at one end, while the other end is seized by an accomplice; and while the two Thugs draw the noose tight, and press the head of their victim forwards, a third seizes him by the leg, thus causing him to fall to the ground. The fatal injury is then easily inflicted. Travelers staying in the same choultry, or public resting-place, are sometimes murdered in the night. In attacking a traveler on horseback, generally one of the gang goes in front of the horse, while another keeps himself in the rear; a third, walking by his side, when finding him off his guard, suddenly seizes him by the arm, and drags him to the ground: the sufferer is then strangled in the usual manner.

Three Thugs are therefore generally required to murder one man; two, at the least, are thought necessary; for to strangle a man single-handed is a rare occurrence, and a feat of this kind is esteemed by the fraternity a most honorable distinction, which goes far to ennoble, in the eyes of his fellows, the Thug who has acomplished it, and even his family, for many generations. After the murder is perpetrated, the body of the victim is generally mutilated, in order, it seems, to expedite its decomposition, and thus to guard against discovery. For the same reason, care is taken to inter the body at a spot where it is not likely to be found; and thus it could happen that entire parties of travelers were destroyed, and not a vestige of them was discoverable. The indiscriminate slaughter in which the Thugs seem to indulge, is to a certain extent restrained by superstition; thus, it is deemed unlucky to kill certain classes and castes; and, as a rule, the female sex is exempt altogether.

The mode of dividing the plunder is probably various. According to one account, 'a portion of it is usually appropriated to defraying the expenses of religious ceremonies; and sometimes a part was also allotted for the benefit of widows and families of deceased members of the gang. The residue of the booty being divided into several parts, was generally shared as follows: To the leader, two shares; to the men actually concerned in perpetrating the murder, and to the person who cut the dead body, each one share and a half; and to the remainder of the gang, each one share.'

The practice of Thugs is not restricted to adventures on land. The rivers of India also are infested by bands of these robbers, who have similar habits to those of the land Thugs. They generally go in considerable parties—the one assuming the dress of travelers of respectability, the others acting as boatmen. When going up the river, they always pretend to be men going on pilgrimage to Benares, Allahabad, or some other sacred place; when going down, they pretend to be on their way home from such places. The travelers intended for their victims are inveigled on the high-roads, and murdered inside the boat, while some of the gang above sing and play. At a signal given by these that all is clear, the bodies of the murdered men are thrown into the river.

The patron goddess of the Thugs is Devî or Kâlî, the wife of the god S'iva, and the deity of destruction. In her name they exercise their profession, and to her they ascribe its origin. Formerly, they believe, Kâlî co-operated with the Thugs, and assisted them in the disposing of the bodies of their victims by devouring them. But through an indiscretion of one of the fraternity, who, out of curiosity, pried into the proceedings of the goddess, she became displeased, and condemned them in future to bury their victims. But though she now refused her future assistance, she presented her worshipers with one of her teeth for a pickaxe, a rib for a knife, and the hem of her lower garment for a noose. Whether on the faith of this legend, or otherwise, it is certain that the pickaxe is the instrument which, by all the Thugs, is held in the highest estimation. Its fabrication is superintended with the greatest care, and it is consecrated to its duties under many and minutely regulated ceremonies; and after it has thus been prepared, it is only intrusted to a Thug selected for this dignity on account of his shrewdness, caution, and sobriety. The place where, and the manner in which, it is then deposited are likewise the subject of the strictest rules; and it is submitted to special purifications after each time that it has been used for the preparation of a grave. The pickaxe is, in short, looked upon with the highest reverence by a Thug; it is the symbol of his faith, and the chief object of his superstitions. That these superstitions are gross and numerous, may be easily anticipated. The belief in omens especially, plays a great part in a Thug's career. All his movements are regulated by it, and the learning of the Thugs consists in a thorough acquaintance with them.

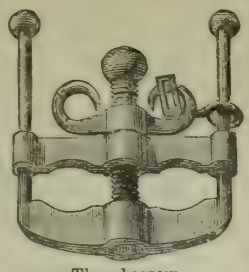
To a neglect of the warnings given by omens, or to an imperfect acquaintance with them, the Thugs invariably ascribe a failure of their undertakings, if it happens. When preparing for an expedition, the auspices are always solemnly taken; and only if favorable it is carried out. Among the bad omens, they count the meeting the corpse of any one belonging to the village, the meeting of an oil-vender, a carpenter, a potter, a dancing-master, a lame or blind man, a fakeer with a brown-waistband, or a Hindu devotee with long traced hair. To sneeze is a bad thing at setting out on an expedition; to meet a woman with an empty pitcher, or an ass braying from the front, a pair of jackals crossing the road in front of the gang, to see a wolf cross the path from left to right. On the other hand, it is a lucky omen to meet a woman with a pitcher full of water, or a pregnant woman, or to hear an ass braying on the left while halting at a stage, or to see a single jackal passing from right to left, or an antelope from left to right. Superstitions like these—and it is not necessary to give more instances of them—sufficiently show that the Thugs consider their murderous practices as countenanced and regulated by higher powers; and it is for the same reason that after every murder they perform a special solemnity called *Tapunî*. It is celebrated in honor of the terrific Kâlî, and its principal feature consists in addressing a prayer to the goddess, and in making the practical stranglers, those who formed part of the expedition, and committed the murders, partake of *gaur*, or consecrated sugar, the effect of which is believed to be irresistible. Other ceremonies are, of course, likewise performed on the occasion; but it is from the eating of the gaur that the strength and prosperity of the Thug are supposed necessarily to be derived. Another feast observed by the Thugs throughout India is called *Kurhae Karna* or *Kote*. It likewise takes place in honor of Kâlî, and the requisites for its celebration are goats, rice, ghee (butter), spices, and spirits. The superstitions of the Thugs are all of Hindu origin; but they are adopted also by the Mohammedans, who, while stout adherents to the tenets of the Koran, yet pay divine honors to the Hindu goddess of destruction. This inconsistency they sometimes reconcile by identifying Kâlî, whose other name is also Bhavânî, with Fatima, the daughter of Mohammed, and wife of Alî, and by saying that Fatima invented the use of the noose to strangle the great demon Rukutbeejdana.

At various periods, steps were taken by the native and English governments to suppress Thuggee—the practice of the Thugs—but it is only since 1831 that energetic measures were adopted by the British authorities to counteract the evil; and though it has not yet altogether disappeared, it may be safely assumed that it is fast dying out.—For a fuller account of the Thugs, the reader is referred to the *Illustrations of the History and Practices of the Thugs* (by E. Thornton, Lond. 1837)—whence the foregoing outline is taken; to the authentic reports of special cases, contained in the same work; and to Col. Meadows Taylor's *Confessions of a Thug* (1840).

THU'JA. See ARBOR VITÆ.

THU'LÉ, the name generally given by the ancients to the most northerly part of Europe known to them, and in the description of which fancy played a conspicuous part. According to Pliny, it was an island in the northern ocean, discovered by the navigator Pytheas, who reached it after six days' sail from the Orcades. The name T. appears to be merely a classic form of the Gothic

Tiel or *Tiule*, 'remotest land' (comp. Gr. *telos*, a goal); and most modern geographers identify T. with Iceland. Some, however, prefer to seek for it in that part of Norway called *Thile* or *Thilemark*, or in Jutland, the extremity of which is known as *Thy* or *Thyland*. Ptolemy considers that Mainland, the principal member of the Shetland group, has the best claim to being regarded as the T. of Pytheas.



Thumbscrew.
(From an instrument in the Antiquarian Museum, Edinburgh.)

THU'MBIKINS, or **THUMBSCREW**, an instrument of torture for compressing the thumb, largely made use of by the Inquisition in Spain, and also occasionally used in England, when examination by torture was practised there. The last instance of its application in Britain was in the case of Principal Carstairs, on whom this mode of torture was inflicted for an hour and a half at Holyrood by the Scottish Privy Council, with the view of obtaining from him confession of the secrets of the Argyll and Monmouth parties, but without effect in producing any disclosures.

THUN, a picturesque and ancient town of Switzerland, in the canton of Bern, 17 miles south-south-east of the city of that name. It stands on the Aar, one mile from the Lake of Thun, out of which the river rushes past the town in a stream of crystal clearness. The old castle of the 12th c. with its corner towers, and the venerable church, are the chief buildings. T. is the starting-place for those who visit the Bernese Oberland, and is consequently visited by crowds every season. Pop. (1880) 5124.

THUN, LAKE OF, in the canton of Bern, Switzerland, between the town of Interlaken on the east, and that of Thun on the north-west; is 12 miles long, 2 miles broad, about 1800 feet above sea-level, and in some places between 600 and 700 feet deep. The scenery is very attractive. Steamers ply on the lake, and there is a good post-road along the south shore.

THUNDER. See **LIGHTNING**.

THU'NDERBOLT, in Heraldry, a bearing borrowed from classical mythology, which may be described as a twisted bar in pale inflamed at each end, surmounting two jagged darts in saltire between two wings displayed with streams of fire.

Thunderbolt.

THU'RGAU (i. e., valley of the Thur), a frontier canton in the north-east of Switzerland, bounded on the N.-E. by the Lake of Constance, and on the W. and S. by the cantons of Zürich and St. Gall. Area, 384 sq. m.; pop. (1880) 99,552. The surface, unlike that of the other cantons of the country, is undulating or hilly, but nowhere mountainous, the chief height being the Hörnli in the extreme south, 3690 feet. The principal river is the Thur, from which the canton derives its name, and which, flowing west-north-west through a broad valley, joins the Rhine in the canton of Zürich. The soil is fertile in the ordinary crops, and remarkably so in fruits—large tracts of open country being laid out in orchards, as well as vineyards. Three-fourths of the inhabitants are Protestants. Capital, Frauenfeld.

THU'RIFER (Lat. *thur*, incense, and *fer-*, to carry), the ministering attendant in the Roman Catholic Church, at solemn mass, vespers, and other solemn ceremonies, whose duty it is to carry the *thurible*, or incense-vessel, and either to minister incense (q. v.) himself, or to present the thurible to be used for that purpose by the officiating priest. The office of thurifer is one of those which belong to the so-called 'Minor Order' of *Acolyte*. See **ORDERS**. The thurible now in use consists of a metallic vessel for holding burning charcoal, commonly of silver or silver-plated, but occasionally also of gold, with a movable cap, and suspended from four chains, so as to be capable of being freely waved about in the air for the readier dispersion of the smoke of the incense which is thrown upon the live charcoal.

THÜ'RINGER-WALD (Forest of Thuringia) is a considerable mountain-range of Central Germany, which extends from the junction of the rivers Werra and Horsel, near Eisenach (q. v.), in a south-east direction to the north of Bavaria, where it joins the Frankenwald, a ramification of the Fichtel-Gebirge. Its total length is about 50 miles, and its highest summits (Gross-Beerberg, Schneekopf, Inselsberg, and Finsterberg) range from a height of close on 3000 feet to about 3200 feet. The range is composed mostly of granite, porphyry, and argillaceous schists, abounding in metallic veins, among which iron ore is most conspicuous, though many others are found more or less plentiful; and auriferous sands occur in some of the rivers which have their source here. The T. is parcelled out among the states of Weimar, Meiningen, Coburg-Gotha, Prussia, Schwarzburg, Reuss, and Altenburg.

THURI'NGIA (Ger. *Thüringen*), the name still borne by that part of Upper Saxony which is generally bounded by the Werra, the Saale, and the Harz Mountains, though it has no longer any distinct terminal significance. The country was so called from the people Thuringii (probably the descendants of the Hermunduri), who were found inhabiting it in the 5th c.

THURLES, a market-town and seat of a poor-law union, in the county of Tipperary, province of Munster, Ireland. It is a place of great antiquity, and is celebrated not only in the bardic history, but also as the scene of a great battle with the Danes. It is situated on the river Suir, 52° 42′ N. lat., 7° 47′ W. long., 86 miles south-west from Dublin, with which city, as well as with Cork, it is connected by the Great Southern and Western Railway. Pop. of township (1881) 4850, with few exceptions Roman Catholics. T. being the seat of the Roman Catholic archbishop, has two convents of nuns, a monastery of Christian Brothers, and a college for ecclesiastical and general education, numerously attended.

THURLOW, EDWARD, LORD, an English lawyer, was born, in 1732, at Little Bracon-Ash, in Norfolk. His father, a clergyman, sent him to school at Canterbury, where he obtained a sound knowledge of the Latin and Greek classics. Thence he proceeded to Cambridge, but in his zeal, it is said, to affect the character of an idle clever boy, he committed breaches of discipline which compelled him to leave the university. He became a student of the Inner Temple, and was called to the bar in 1754. He was a fellow-pupil, in a solicitors's office, with the poet Cowper, and still affected idleness, although, in reality, he worked hard to make himself a good lawyer. His lofty stature, strongly marked features, dark eyes, bushy eyebrows, and look of self-possession and wisdom, led, it appears, every one with whom he came in contact to attribute to him qualifications he really did not possess. His gifts, however, were those which are most likely to insure early success at the bar. An accidental meeting, at a coffee-house, with the Scotch solicitors in the great Douglas case, led to his employment in it as junior counsel, and to his acquaintance with the members of the Douglas family. It was one of them, the Duchess of Queensberry, who, by her influence with Lord Bute, obtained for him, in 1761, the rank of King's Counsel. After this period, he acquired a still higher reputation by his speech in the Douglas case—the greatest effort of his life. In 1768, he was returned for Tamworth, and became a zealous supporter of Lord North.

When, in 1771, he was appointed Solicitor-general, he attracted the special notice of George III. by the zeal he displayed in supporting the American policy of the government. In 1778, he was raised to the woolsack; and such was his influence with the king, that he was allowed, contrary to all precedent, to retain the office under the Rockingham administration. He caused great embarrassment by opposing all the measures brought in by that government. Under the coalition ministry, he was compelled to retire; but he was restored as Chancellor on Mr. Pitt coming to power. For a time he supported the government; but relying again on the support of the king, he once more began to give trouble, and ventured to oppose the measures his colleagues brought forward. Pitt then intimated that he or T. must retire, and the king, without any hesitation, consented to his removal (1792). T. sank into comparative obscurity. He amused himself in reading the Latin and Greek classics with his nephews, and spent much of his time in visiting and receiving visits. He died at Brighton on September 12, 1806. Lord Campbell, in his excellent life of T., says he can find nothing recorded of him to justify the great reputation for ability he had among his contemporaries, and ascribes it chiefly to his assuming manner; but it must be recollected that he had no Boswell to record his talk, and that it was his conversation which was admired. Johnson would not have said of an ordinary person as he did of him: 'I would prepare myself for no man in England but Lord Thurlow. When I am to meet him, I should wish to know a day before.'

THU'RSDAY (Swed. *Thorsdag*, Ger. *Donnerstag*), the fifth day of the week, is so called from Donar or Thor (q. v.), who, as god of the air, had much in common with the Roman Jupiter, to whom the same day was dedicated (Lat. *Jovis dies*, Fr. *Jeudi*).

THU'RSO, a burgh of barony, seaport, and market-town on the north coast of Caithness, 20 miles north-west of Wick. It is irregularly built, but contains some handsome freestone houses, and two handsome churches. Thurso Castle, to the east of the town, is a fine venerable structure. The harbor is a safe one for vessels not over 150 tons burden. At Scrabster, on the west side of the bay, steamers call regularly, and there is a good roadstead with a pier. Ropes are manufactured; and cattle, grain, sheep, and paving-stones exported. A railway connecting Wick and T. with the south was completed in 1874. Pop. (1881) 4055.

THWARTS, in a boat, are the cross-benches on which the rowers sit.

THY'LACINE (*Thylacinus*), a genus of carnivorous marsupial quadrupeds, nearly allied to opossums and dasyures. The muzzle is elongated, and somewhat dog-like. The tail is long and tapering. Only one species is known (*T. cynocephalus* or *Harrisii*), a native of the mountainous parts of Van Diemen's Land, where it inhabits the wildest glens, but issues from them to prey upon the sheep of the colonists, by whom it is commonly called the wolf, or tiger-wolf, and is destroyed by all possible means. Kangaroos, echidnæ, &c., seem to have been its ordinary prey before sheep were introduced. It is of the size of a large dog, and is the most powerful of Australian carnivorous quadrupeds. It is very active and fierce. It is not known to exist except in Van Diemen's Land.

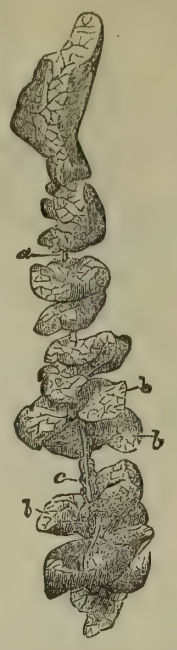
THYME (*Thymus*), a genus of humble half-shrubby plants, of the natural order *Labiatæ*, having a two-lipped calyx, and four diverging stamens. GARDEN T. (*T. vulgaris*) is 6—10 inches high, with narrow almost linear leaves, and whitish or reddish flowers, which grow in separate whorls, six in a whorl. It is common upon dry hills in the south of Europe, and is very commonly cultivated in gardens on account of its fragrance.—WILD T. (*T. Serpyllum*) has a procumbent stem with many branches, 2—3 feet long, oval leaves and purplish flowers arranged in whorls, which are united in a head. It is abundant on hills and mountains in Britain, and in all parts of Europe, and the north of Asia. It is less fragrant than Garden T., but both species contain an aromatic essential oil. The flowering branches (*Herba Thymi* and *Herba Serpylli*) are used in medicine as a powerful stimulant, and those of Garden T. are also used in cookery for flavoring.—The LEMON T., or Lemon-scented T. of our gardens, is regarded as a variety of *T. Serpyllum*. It is generally of still lower growth than the common Garden Thyme.—No species of T. is indigenous in America.

THYMELEA'CEÆ, a natural order of exogenous plants, of which the Mezereon and Spurge Laurel (see DAPHNE) are familiar examples. This order consists chiefly of shrubs, with a few herbaceous plants, and contains about 300 species, natives chiefly of the warmer temperate countries. The leaves are undivided. The perianth is inferior, tubular, colored, 4-cleft, or rarely 5-cleft, sometimes with scales in the orifice. The stamens are perigynous, often eight, sometimes four, and less frequently two. The ovary is one-celled, and the fruit one-seeded, either nut-like or a drupe. The bark is generally fibrous and tough. That of *Gnidia daphnoides* is used in Madagascar for ropes, and that of *Lagetta lintearia*, or Lace-bark, in the West Indies for whips. The bark of some species of *Daphne* and nearly allied genera is made into paper in the East. See DAPHNE. Poisonous properties prevail in the order. The bark is in general very caustic, and that of some species is used as a vesicatory, and for other medicinal purposes.

THY'MIC ASTHMA. See THYMUS GLAND.

THY'MUS GLAND, or simply the Thymus (Gr. *thymos*, sweet thyme, because the gland was compared to the flower of this plant by Galen), one of those structures which, like the spleen, suprarenal capsules, and thyroid gland, are placed amongst the ductless glands. It is a temporary organ, and is commonly stated to attain its greatest development in relation to the rest of the body during the latter part of fœtal life. 'But this,' says Dr. Carpenter, 'is a mistake, for the greatest activity in the growth of this organ manifests itself in the human infant soon after birth; and it is then, too, that its functional energy seems the highest. This rapid state of growth, however, soon subsides into one of less activity, which merely serves to keep up its proportion to the rest of the body; but its increase is continued till the age of puberty is attained.'—*Principles of Human Physiology*, 6th ed., p. 143. After remaining stationary for some years, it gradually assumes, in well-nourished persons, the characters of a mass of fat.

On examining the gland when its growth is most active, it is found to consist of two lateral lobes placed in contact along the middle line, extending from the lower border of the thyroid gland to the cartilage of the fourth rib, and covered by the sternum and by the margins of the muscles passing upwards from the top of that bone. The gland is of a pinkish gray color, soft and lobulated on its surfaces; and by careful manipulation it may be shown to consist of an assemblage of hollow glandular lobules, united together by connective tissue, all their cavities communicating with a central reservoir or main canal, from which there is no outlet. This arrangement is well seen in the accompanying diagram of a portion of the thymus gland of a calf. The thymus is about two inches in length, one and a half in breadth, and four lines thick, and at birth it weighs about half an ounce; its chemical constituents are water, albumen, gelatine, sugar (?), fats, leucine, sarkine, xanthine, and formic, acetic, succinic, and lactic acids, besides the ordinary inorganic salts—the number of the ingredients, many of them of rare occurrence elsewhere in the body, indicating that important chemical changes take place in their structure. Its exact uses are unknown, but like the other ductless or vascular glands, it doubtless plays some important part in the preparation and maintenance of the blood. The albuminous nature of the juice of this gland, and the finely granular appearance it presents, indicate that a material is here being prepared which is to be rendered subservient to nutrition; and various facts which have been noticed in regard to its changes of bulk (especially its rapid diminution in over-driven lambs, and its subsequent gradual redistension during rest, if plenty of food is given) strongly confirm these views.



Portion of Thymus of Calf, unfolded:
a, main canal; *b*, glandular lobules; *c*, isolated gland-granules seen in the main canal.

The anatomy, physiology, and development of this gland have occupied the attention of three of the most celebrated writers of the present century: see Sir Astley Cooper's beautiful monograph, *On the Anatomy of the Thymus Gland*, 1832; Mr. Simon's *Physiological Essay on the Thymus Gland*, 1843; and Professor Goodsir's Memoir 'On the Development of the Thymus Gland,' in the *Philosophical Transactions* for 1844.

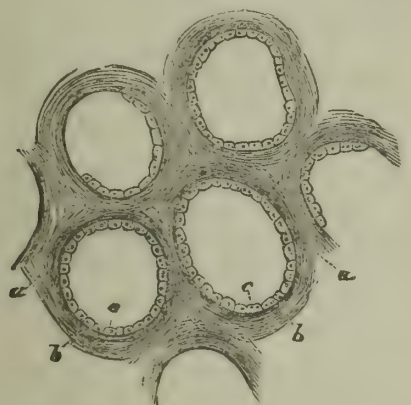
The only disease of this structure requiring notice is hypertrophy—a condition which was supposed occasionally to induce suddenly fatal dyspnœa (breathlessness) in children. There are, however, sound reasons for believing that there is no essential connection between the glandular enlargement and the suffocative paroxysms; because (1) the affection termed *thymic asthma* may occur with an abnormally *small* thymus; and (2) when a thymus, enlarged by malignant disease (encephaloid, for example) does occasion dyspnœa, it is not sudden and paroxysmal, but constant in its nature. The disease is known under various other names, as *Laryngismus stridulus*, *spasmodic croup*, and *child-crowing*. This *bastard croup*, as Dr. Watson calls it, is far more common than true croup, and is very liable to be confounded with it. 'In their most obvious symptoms, the two affections are much alike. The broad and essential difference between them is the absence in the spurious disorder of inflammation and of fever, and consequently of any concrete or other effusion from the mucous membrane of the air-passages. The child is seized all of a sudden, roused perhaps from its sleep, or checked in the act of sucking, by a catch, or interruption of its breathing, more or less complete. It strives and struggles to inspire, but is apparently unable to do so; at length, the effort is successful, and the breath is drawn in with a shrill whistling or crowing sound, like that which characterizes the inspirations of croup or of whooping-cough, and depending, no doubt, upon the same cause—a narrowing (in this complaint, temporary) of the fissure of the glottis.'—*Lectures on the Principles and Practice of Physic*, 4th ed. vol. i. p. 866. The more complete the closure of the chink of the glottis is, the more intense will be the symptoms.

In severe cases, the countenance becomes livid, the eyes fixed, and there is an entire suspension of the respiratory function for a while. The child makes vehement struggles to recover its breath, and at varied intervals, from a few seconds up to a minute or longer, air is admitted through the glottis, now partially open; and this rush of air produces the characteristic sound. A fit of coughing or crying then often supervenes, and the attack terminates with some exhaustion. If, however, the glottis does not partially open, the child will die suffocated (or in popular language, *in a fit*) at the end of two, or at most, three minutes, falling back pallid and exhausted in its nurse's arms. In association with these symptoms, is often a contracted state of the flexor muscles of the thumb, fingers, toes, wrist, and ankle, giving to the foot an appearance like that of club-foot. It has been observed by Dr. Ley, who has written a volume on this disorder, and other observers, that there is a frequent connection between child-crowing and certain other affections, as (1) tumefaction of the glands in the neck and chest, and entanglement of the pneumogastric nerve or its branches among these glands; (2) painful dentition, which is apt to produce glandular swellings of the neck; and (3) excoriations behind the ears, and inflamed and irritable scalp, which also occasion enlargement of the glands. The nerves passing from the enlarged gland to the nervous center convey the sensation of irritation; and the inferior laryngeal nerve, which supplies nearly all the muscles of the larynx, acts on the efferent or motor nerve, and excites spasmodic contraction of the muscles closing the aperture of the glottis. Hence the phenomena are those of Reflex Action.

During the paroxysm, the warm bath may be tried, if it can be

got ready at once. The application of hot fomentations to the throat by means of a large sponge, is often very serviceable, and is usually more accessible than the bath. The muscles sometimes relax when cold water is freely sprinkled over the chest and face, and these simultaneous applications of hot and cold water are by no means incompatible. The subsequent general treatment must depend upon the exciting cause, on the painful dentition, the eruption of the head, &c. The state of the bowels and of the skin must always be carefully regulated, and change of air is always advisable. Phosphate of lime, in doses of from five to ten grains, three times a day, administered in chalk mixture, has been strongly recommended by Dr. W. Budd in this disease, and is well deserving of a trial.

THY'ROID BODY or GLAND (Gr. *thyreos*, a shield, and *eidos*, like), one of the ductless or vascular glands, lying at the upper part of the trachea, and consisting of two lateral lobes, placed one on each side of this canal, and connected together by a narrow transverse portion at the lower third, called the isthmus. It is of a brownish red color, and its normal weight is about an ounce, but it occasionally becomes enormously enlarged, constituting the disease called bronchocele or goitre. Each lobe is somewhat conical, and is about two inches long and three-quarters of an inch broad. The thyroid body differs from the other vascular glands in structure, for it 'consists of an aggregation of closed vesicles (*b*, *b* in the figure), which seem to be furnished with a



Group of Gland-vesicles from the Thyroid Gland of a Child : *a*, connective tissue ; *b*, membrane of the vesicles ; *c*, epithelial cells.

true limitary membrane, and therefore to be real gland vesicles embedded in a stroma (*aa*) of connective tissue, and not communicating with any common reservoir. These bodies vary in diameter in the human subject from $\frac{1}{200}$th to $\frac{1}{18}$th of an inch; and they contain an albuminoid plasma, which is either faintly granular or of a somewhat oily aspect, amidst which are seen a number of corpuscles, the greater part of them in the condition of nuclei, while some have advanced to that of cells.'—Carpenter's *Principles of Human Physiology*, 6th ed. p. 143. The thyroid body is abundantly supplied with blood by the superior and inferior thyroid arteries, which continue subdividing, till they ultimately form a very minute capillary plexus upon the limitary membrane of the vesicles. This body, like the thymus and supra-renal capsules, is relatively larger in the fœtus and during infancy than in after-life.

From the investigations of Mr. Simon (see his Memoir on the 'Comparative Anatomy of the Thyroid,' in the *Philosophical Transactions* for 1844), it appears that a thyroid is present in all mammals, birds, reptiles, and amphibians, and that he has discovered it in many fishes. Its presence in some of the fishes in which Mr. Simon observed it, has, however, been called in question by Dr. Handfield Jones (see his article 'Thyroid Gland' in the *Cyclopædia of Anatomy and Physiology*).

Mr. Simon has propounded a theory regarding the function of this gland which is certainly ingenious, and probably correct. Basing his theory on the circumstance, that the thyroid arteries arise in close proximity to the cerebral, he considers that the thyroid gland acts as a diverticulum to the cerebral circulation, exercising at the same time its secreting function in an alternating manner with the brain.

Little need be said here regarding the diseases of this organ, as the most important of them, bronchocele or goitre, has been already described under the latter title.

THY'RSUS, in Botany, a Panicle (q. v.), in which the flower-stalks are short, and the flowers are thus close together, so that the panicle is dense. It is a very common form of inflorescence. The use of the term is, however, somewhat vague.

THYSANU'RA, an order of wingless insects of small size, and which undergo no metamorphoses. They are furnished with peculiar organs, either along their sides or at the extremity of the abdomen, which, as well as the legs, are used for locomotion. The whole order is comprised in two families—*Poduridæ*, or Spring-tails (see PODURA), and *Lepismidæ*. The *Lepismidæ* have an elongated body, covered with small shining silvery scales. The abdomen is furnished on each side with a series of movable appendages; it has also at its extremity a compressed appendage of two pieces, and three jointed bristles, which are used in leaping. The *Lepismidæ* inhabit dark and moist places, as behind window-shutters, beneath planks, &c.; many of them often in the interior of houses.

TI (*Cordyline Ti*, formerly *Dracæna terminalis*), a plant of the natural order *Liliaceæ*, and nearly allied to the Dragon Tree. See DRAGON'S BLOOD. It is found in the south-east of Asia, the Eastern Archipelago, the Sandwich Islands, and many other island groups of the Pacific Ocean. It attains a height of ten or twelve feet, sometimes more, with a tree-like form, lanceolate leaves of a reddish hue, and branching panicles. The fruit is a three-celled and three-seeded berry. The leaves afford food for cattle. They also form durable thatch for houses. Their fibres are sometimes made into cloth. It is most valuable, however, for its root, which is very large, and when raw, is hard, fibrous, and almost insipid; but becomes soft and sweet when baked—is very nutritious, and much used as an article of food. Good sugar is also made by evaporating its juice; the fermented juice is used as an intoxicating beverage, and a kind of ardent spirit is distilled from it.

Tiara.

TIA'RA, the triple crown of the pope, which is considered to be symbolical of his temporal, as the keys are of his spiritual authority. It is composed of a high cap of gold cloth, encircled by three coronets with a mound and cross of gold on the top. From the cap hang two pendants, embroidered and fringed at the ends, and semée of crosses of gold. The original papal crown consisted of the cap alone, and was first used by Pope Damacus II., 1048 A.D. The cap was surrounded with a high coronet by Boniface VIII. in 1295; the second coronet was added in 1335 by Benedict XII.; and the third by John XXIII. in 1411.

TI'BER, the chief river of Central Italy, and the most famous in the peninsula, rises from two springs in a wood of beech trees in a dell of the Tuscan Apennines (province Arezzo), about six miles north of the village of Pieve-San-Stefana, and in lat. about 43° 45′ N. Its course until it reaches Perugia is south-south-east; thence, as far as Rome, it pursues, along an irregular zigzag line, a southern direction; but when it enters the plain of the Campagna, it curves to the south-south-west, and enters the Mediterranean by two branches, which enclose the Isola Sacra. The entire course of the river is about 212 miles. The most celebrated towns on or near its banks are Perugia, Todi, Orvieto, Rome, and Ostia; and its chief affluents are the Nera (anc. *Nar*), and Teverone or Aniene (anc. *Anio*) from the left, and the Chiana from the right. In the upper portion of its course, from its source to the city of Orvieto, it is rapid and turbid, and of difficult navigation. It is regularly navigable for boats of 50 tons to the confluence of the Nera, 100 miles from its mouth, and small steamers ascend to within 7 miles of that point. Wine, corn, charcoal, wood, and other produce from the interior are conveyed by the T. to Rome. Within the walls of Rome (q. v.), the width of the river is 300 feet, and the depth from 12 to 18 feet. Of its two mouths, the northern, the Fiumicino, is the channel of commerce; the southern, the Fiumara, is useless for commercial purposes, owing to the accumulation of sand at its mouth. The T. is supplied mostly by turbid mountain torrents, whence its liability to sudden overflowings of its banks; even the oldest Roman myth, that of Romulus, being inseparably associated with an inundation. Its waters, too, are still discolored with yellow mud, as when Virgil described it—

Vorticibus rapidis et multa flavus arena.

TIBE'RIAS. See GALILEE.

TIBE'RIUS (TIBERIUS CLAUDIUS NERO CÆSAR), the second emperor of Rome, was the son of Tiberius Claudius Nero, one of the active partisans of Pompey and Antony in the war of the second triumvirate, and of Livia, a descendant of Appius Claudius Cæcus, and was born 16th November 42 B.C. The triumvir, Octavianus Cæsar (afterwards the Emperor Augustus) having become enamoured of Livia, the complaisant husband divorced her, and, though then pregnant with Drusus, she was immediately espoused by Octavianus (38 B.C.). T. being now one of the imperial household, received a careful education, was allowed by Augustus the same public honors as were paid to his nephew and grandsons, and as well as his brother Drusus, was employed in active service at the head of the legions on the outposts of the

empire. T. was at this time in favor with the emperor and the Roman people, chiefly because his retired mode of life and subordinate position restrained his evil propensities; and his praises as a military leader were loudly sounded, though the character of his opponents was not such as called for the display of very great warlike ability. At the command of Augustus, he unwillingly divorced his wife, Vipsania Agrippina, to marry the emperor's daughter Julia (11 B.C.); but disgusted at her open profligacy, he gladly accepted a command on the German frontier, and afterwards (6 B.C.) retired to Rhodes, where he lived for seven years, returning after Julia's banishment to Pandataria. The death of two of Augustus's three grandsons paved the way for the adoption of T., and of the third grandson, Agrippa Postumus, by the emperor, and for the appointment of T. as heir to the throne, Agrippa being, apart from his youth, wholly unfitted for the exercise of uncontrolled authority. Accordingly, T. ascended the throne (14 A.D.), and by his manly and graceful demeanor, prudence and moderation, gave promise of a happy reign. His mild and benignant sway at first, was doubtless due in part to the necessity of outbidding his popular nephew Germanicus (who was of Octavian blood by his mother's side) for public favor; but after his kinsman's death (19 A.D.), and the removal of all who were likely to put forth claims to the throne, T.'s true character became better known. He had always shown himself reserved, jealous, timid, and irresolute, though not cowardly, and almost devoid of sympathy and affection; and with the scepter firmly in his grasp, the development of these qualities produced the most suspicious and cruel of tyrants.

During the life of his mother, however, T., who held her somewhat in dread, took little share in the government, but led a retired life, attempting to ape the virtues he had not. The chief events of this part of his reign were the increase in number and amount of the taxes, the removal of all power from the people and the senate, and the institution of prosecutions for *læsa majestas*, the latter being nothing else but a convenient mode of removing all who incurred the displeasure of the emperor. But after Livia's death (29 A.D.), he resigned the whole real authority into the hands of Ælius Sejanus, a Roman knight, and a commander of the prætorian guards, and gave himself up to the unrestrained indulgence of his sensual appetites. The empire did not suffer by the change, for Sejanus was a man of great ability and resolution, and well knew how to maintain his ascendency over the emperor by pouring into his suspicious ear tales of conspiracy, and then allaying the imperial fears, and satisfying his own private enmities by the condemnation for *læsa majestas* of eminent Roman citizens. In 27 A.D., T. retired to the island of Capri, there to wallow in his brutish enjoyments with more freedom, leaving Sejanus, whom he made his coadjutor in government, and equal in position, at the head of the government; and from this period till the discovery of the ambitious aspirations of Sejanus, and his downfall (31 A.D.), the Roman annals are crowded with proscriptions at Rome, and infamous excesses at Capri. Sejanus's successor, Macro, had all his vices, and few or none of his talents, and so the state of affairs was even worse than before, the senate exhibiting a rare degree of sycophancy, by endorsing with the most accommodating promptitude every order, however tyrannical, of the emperor or his confidant. It may seem strange that this frightful misgovernment by an aged debauchee and his ignoble favorite should have been so quietly submitted to by the Romans, but in reality their tyranny was confined exclusively to those of rank, the common people being treated with forbearance and occasional liberality, as there was nothing to fear from them. T.'s powerful constitution was at last completely destroyed by his excesses, and falling sick at Astura, he traveled to Misenum, where, in the villa of Lucullus, he ended his infamous life, 16th March 37 A.D., his death being hastened a few days either by poison or suffocation.

TIBE'T, THIBET, or TUBET, is the European name of a country in Central Asia, bounded on the N. by Mongolia, on the E. by China, and on the S. and W. by Hindustan. The native name is Bod or Bodyul, the land of Bod. It covers an area of from 600,000 to 800,000 sq. miles, with the north-eastern part of which we are still almost totally unacquainted. The pop. is estimated at 6,000,000.

Surface.—From an elevated tract at the western extremity of T., where the Hindu-Kush and Pamir highlands meet, the mountain-system of the Kuenlun runs east, and the greater chain of the Himalaya south-east, enclosing in the angle between them the Tibetan table-land, which extends eastward to the frontier of China. Although T. is described as a table-land by geographers, its surface is traversed by mountain-chains, which, near its western and eastern frontiers, interlace and ramify in a complicated manner. On the southern border, the height of the plateau through which the Sanpu runs, from a point near its source to H'lassa, was in 1866 carefully ascertained by barometrical observations. Along the great route from H'lassa to Gartok, in the basin of the Indus, for a distance of 800 miles, the average elevation was found to be 13,500 feet. Several stages of the journey along the route were above 16,000 feet; only one sank to 11,000. To the north and east of this elevated tract, the plains of T. are supposed to descend to much lower elevations; but accurate observations are still wanting. The Himalaya, 20 summits of which are higher than the loftiest of the Andes, stand out from the plateau, and are only connected with it by ridges of lesser elevation. They project from the highlands like buttresses which rise higher than the walls they support. In general, the descent from T. on the south is by three gradations, the first of which is very abrupt. The mountain-roads by which T. is entered from India, pass through deep ravines cut by the streams in the mountains, and present the wildest and grandest scenes described by travelers.

The mountains which rise from the table-land divide T. into several natural regions. The Karakorum range, which runs parallel to the Himalaya, forms with them a great valley, drained on the west by the tributaries of the Indus, and on the east by the Sanpu. To the whole basin of the Indus north of the Himalaya, the name of Little Tibet is sometimes given; but more generally the upper basin is known as Ngari, the middle basin as Ladak (q. v.), or Middle Tibet; and the lower as Bultistan, or Lower Tibet. The countries drained by the Sanpu are described as Tibet proper, which is in turn divided into Dsang, the district of the Upper Sanpu, and Wei, surrounding H'lassa, the district of the Lower Sanpu. Further east, the tract drained by the tributaries of the Yang-tze-kiang, in which are Lithang and Bathang, is known as Kham. North of the basin of the Sanpu, lies another region, a great elevated desert, called Khor on the west, and Katchi on the east; and at the north-eastern extremity of T. is a hilly tract, in which the Hoangho takes its rise, and in the center of which is situated the Lake Ko-ko-nor. The provisional name given to the tract is the country of the Ko-ko-nor.

Geology.—The geology of T. is little known except on the south and western frontier. The highest part of the Himalaya consists of granites and crystalline strata, and in the neighborhood of the Lake Manasarowar, of volcanic rocks. On the table-land, the strata belong to the most recent Tertiary epoch (the Pleistocene). They lie horizontally as they were deposited, and seem to have been lifted up in one unbroken cake to their present prodigious elevation. T. is believed to abound with silver, copper, and tin, but the absence of fuel renders its mineral wealth unavailable. Gold is found in considerable quantities; and salt, sulphur, borax, and nitre abound.

Climate.—T. lies between the latitude of Naples and Cairo, and might be supposed to enjoy a similar climate. But its great elevation renders it excessively cold during the winter, when its climate resembles that of the arctic regions more than that of countries in the zone to which it belongs. The mountains and the great plains which lie between T. and the sea rob the winds of their moisture, and hence another peculiarity of the climate is its excessive dryness. Timber never rots, but it breaks from brittleness; flesh exposed to the wind does not become putrid, but dries, and can be reduced to a powder. The air loses its conducting power; and persons dressed in sheepskins give out long electric sparks when they approach conducting substances. During the winter, the winds are excessively high, and the weather-beaten rocks break into a dust, which mixes with the loose alluvial soil, and with it is blown about in blinding clouds. The limit of perpetual snow is from 16,000 to 18,000 feet high on the Tibetan side of the Himalaya, while on the Indian or southern side it is in some places only 13,000—a fact attributed to the dryness and purity of the air above the table-land. The Tibetan glaciers, particularly in the mountain region of the west, are of enormous extent. Pastures and low bushes make their appearance at 18,544 feet—2800 feet higher than Mont Blanc, and 1279 feet above the snow-line on the Andes near Quito. Below this level extends a country of bare and scanty pastures. Owing to the great dryness of the air, trees (the cedar and birch) are only met with in a few scattered spots on the hills. In the great plains, the pursuits of the inhabitants are chiefly those of the pastoral tribes of the steppes of Central Asia. In the valleys, however, the soil is more productive; and fruit-trees, the vine, and the European grains are cultivated. The conditions of the climate render irrigation necessary, and the construction and maintenance of terraces along the slopes. This has given rise to a kind of agriculture characteristic of T., which demands skill and continuous labor, and which has called into existence an intelligent, strong, and hardy population. Among the productions of T. are barley, buckwheat, grapes, and all the European fruits.

Industry.—The Tibetans have made considerable progress in the industrial arts. They are ingenious jewellers, and manufacture extensively fabrics of wool and goat's hair, Buddhist idols, &c. In spite of the inaccessible nature of the country, and the absence of good roads and bridges, the rivers being crossed by inflated skins, a great trade is carried on with the neighboring lowlands. That with China is conducted chiefly at Sinning, but partly at H'lassa, by caravans, the goods being conveyed on the backs of

oxen, mules, and horses. The raw produce of T. is exchanged for tea, or Chinese manufactures, and European cutlery. A great trade is also carried on with Nepaul and Bhotan, from which, in exchange for the produce of T., broadcloths and Indian manufactures are imported. From Turkestan the trade is no less important.

Language and Religion.—The language of the Tibetans, spoken also in Nepaul, and by the inhabitants of Bhotan, belongs to the monosyllabic or Chinese class. See PHILOLOGY. Tibetan is singularly free from dialects, from which it is concluded that it spread rapidly in recent times. It has a copious literature, chiefly religious. The religion of the Tibetans is a kind of Buddhism. See LAMAISM. At the extreme west, in Bultistan, however, Mohammedanism prevails, which, having spread from Cashmere and Persia, and not from Turkestan, is Shiite. Some practices common, it is believed, to the earlier races of men, are said to survive among the Tibetans. The most remarkable is Polyandry (q. v.), brothers being allowed to have one wife in common.

Government.—Almost the whole of T. proper is now tributary to China. The government is to some extent, however, in the hands of a Buddhist hierarchy, the name of the chief priest being the Dalai-lama, and the second the Bogdo-lama. These spiritual and temporal princes rule in different parts of the country. There are Chinese soldiers in all the chief towns, and a few years ago their number was said to be upwards of 60,000. The Chinese generals have the entire control of the army, and the direction of the most important temporal affairs. Commerce is in the hands of the government, and is closely watched, there being Chinese garrisons at the entrance to all the chief passes.

There are several important towns in Tibet, of which H'lassa (q. v.) is the chief.

History.—The early history of T. is legendary. The first king, who flourished 113 B.C., was exposed in a copper box, and afterwards found swimming in the Ganges. As early as the beginning of the fifth century after Christ, a Buddhist missionary from Cashmere is said to have penetrated into T., and to have obtained a footing for the doctrines of Buddha. In 821, T. was compelled to pay tribute to China. Early in the 10th c., King Dharma adopted Mohammedanism; but he was killed in 925, and Buddhism was re-established. In the beginning of the 11th c., T. was split into several states, and its power declined. In the 12th and 13th centuries, the Chinese began to conquer the eastern parts of T., which, however, did not become tributary to Pekin till 1720, when they were placed under their present government. Western Tibet has been more exposed to the inroads of the Turkish tribes than of the Chinese. The former were, however, expelled from it by Aurungzebe in the 17th c., and then it was that Mohammedanism was introduced. In the early part of this century, Western Tibet was annexed to the Sikh empire of Runjeet Singh. It now forms part of the territory of the Maharajah of Cashmere.

Until a comparatively recent period, T. was only known from the accounts given by Marco Polo and the Jesuit missionaries, travelers respectively of the 13th and 17th centuries. It was, however, visited in 1774 by George Bogle, and in 1783 by Samuel Turner, both sent by Warren Hastings on missions to the Dalai-lama. In this century it has been partially explored by Manning (1812), Captain Strachey (1846), the French Jesuits Huc and Gabet, the brothers Schlagintweit (1855—1857). On the 15th May 1866, it was stated to the Geographical Society of London that a regular survey of Lower Tibet and Ladak had been completed by the Indian government. While the work was proceeding, Major Montgomerie, the officer in charge, conceived a plan of carrying out the survey in the neighboring districts of T., closed by the jealousy of the Chinese officials against Europeans. He had Hindus of education, or pundits, instructed specially to take scientific observations, and sent them, disguised as merchants, to explore T. beyond the Chinese frontier. The pundits traveled over and carefully surveyed that part of the country lying north of the Himalaya, and between the frontier of Cashmere and H'lassa. They visited the great gold-fields of T., which were found to extend 1000 miles south-east of Ilchi, the mart from which the produce of the diggings is exported; and they furnished accurate and copious information about districts which, as yet, no European has been allowed to enter. One of these pundits, a semi-Tibetan, who was despatched in 1871, succeeded in exploring 320 miles of unknown territory, discovering and marching round the great lake Teugri-nor in the north, which is 50 miles long. The journey of the pundit Nani Singh, in 1874 and 1875, is one of the most important in geographical results that have been made in the present century. Passing from Leh to H'lassa, he traversed for the first time the vast lacustrine plateau of T., and thence made his way into Assam. While these explorations have been made in the west of T., attempts have been made to penetrate the south-eastern corner of the table-land.—See Colonel Montgomerie's *Reports of Trans-Himalayan Explorations; Tibet in the Last Century*, by Clements Markham (1876); and Sir William Temple in the *Proceedings of the Geographical Society*, 1882.

TIBU'LLUS, ALBIUS, the Roman elegiac poet, was born of equestrian family, probably 54 B.C., and died young, not long after Virgil, about 18 B.C. We know nothing of his youth or education. From his equestrian ancestors he inherited an estate at Pedum, between Tibur and Præneste, which, like the estates of Virgil and Horace, had been either wholly or partially confiscated in the civil wars. T., however, recovered part of his property, and spent upon it the best part of his short life. He was patronized by Messala, whom, in 31, he accompanied into Aquitania, to suppress a serious revolt which had broken out in that province. He was present at the battle of Atax, which gave the final blow to the insurgents; and he celebrates, in a fine strain of poetry, the honorable part he bore in the campaign. Next year, Messala was sent to the East, and again T. accompanied him; but having been obliged from illness to stop at Corcyra, he returned to Rome. At this point, the public life of T. ceases; and henceforth he devoted himself to the study and composition of poetry. His Elegies, divided into four books, are mainly addressed to his mistresses, Delia, Nemesis, and Glycera, whose inconstancy or coldness he bewails in tender and exquisitely finished verses. The third book, however, is now believed to be the work, not of T., but of another and inferior poet; while the hexameter poem on Messala, with which the fourth book opens, is, from internal evidence, supposed to be also by another and inferior hand. Only the first book was published during the poet's lifetime, which, brief as it was, yet passed peacefully away amid all the blessings of pecuniary competence, patronage of the great, health, and fame. The character of T. was singularly pure, amiable, and winning. During life, he had the honor of being addressed in an ode and an epistle by Horace: after death, of being bewailed in an elegy of matchless beauty by Ovid. The best edition of his poems is that of Dissen (Göttingen, 1835).

TIC DOLOREUX. See NEURALGIA.

TICHVI'N, a town of Great Russia, in the government of Novgorod, 168 miles east-south-east of St. Petersburg, on the Tichvinka, which, together with the canal of the same name, connects the Volga with the Baltic. It contains numerous churches, but is best known for its monastery, which contains a 'thaumaturgical' or miracle working image of the Virgin. The inhabitants are chiefly employed in the transit-trade by land and water. Pop. (1880) 6000.

TICI'NO, the most southern canton of Switzerland, bounded on the W. and S. by Italy, and on the E. by Italy and the canton of Grisons. Area, 1082 sq. m.; pop. (1880) 130,777. Its surface, forming a portion of the southern slope of the Alps, comprises lofty mountains in the north. The northern boundary between T. and the cantons of Uri and Grisons is a range of the Lepontine Alps, rising in Mount St. Gothard (q. v.) to the height of about 12,000 feet. Offsets from the Lepontine and Rhætian Alps occupy the greater part of the canton. In the south, the country falls away into flats, and the scenery becomes Italian in character. The principal rivers are the Ticino (q. v.), by which the whole of the canton, with the exception of a trifling portion, is drained, and from which it receives its name. In the north, cattle-breeding and the preparation of dairy produce are the chief employments. South of the Alpine regions are elevated forest-clad districts; and further south, olive-yards and vineyards, cornfields and plantations of figs, almonds, oranges, citrons, and pomegranates occur. The canton varies as much in climate as in productions. Cattle, cheese, wine, fruits, and hay are exported. The northern part of Lake Maggiore, and almost the whole of Lake Lugano, are included within the canton. The inhabitants belong to the Italian type, and for the most part speak the Italian language, and are of the Catholic religion. The chief towns are Bellinzona, Locarno, and Lugano, each of which is by turns the seat of government.

TICINO, a river of Switzerland and the north of Italy, rises on the southern slopes of Mount St. Gothard, and flows south through Lake Maggiore, and south-south-east through the north of Italy to its junction with the Po, four miles below Pavia. Entire length about 120 miles, for the last 75 of which, from the point at which it leaves Lake Maggiore, it is navigable.

TICK, the popular name of a great number of *Acarides* (see ACARUS), forming a section called *Suctoria*, having the mouth in the form of a sucker, with no apparent mandibles. They live by sucking the juices of plants and animals. Some of them are aquatic. The Harvest-bug (q. v.) is a well-known example of the suctorial *Acarides*. It belongs to a family called *Leptidæ*. The name T. is more particularly given to the family *Ixodidæ*. They abound in almost all parts of the world, but chiefly in warm countries, in which they are very troublesome pests. Many of them live in woods, attached to branches, but are ready to attach themselves to animals, which sometimes suffer greatly from their numbers, their blood-sucking powers, and the inflammation which they cause. The Tampan (q. v.) is a very troublesome T. of South Africa. The Carapata of Brazil is scarcely less annoying.

It infests dry bushy places, clusters of many hundreds being found clinging to very slender twigs, and they instantly transfer themselves to any horse, ox, or other quadruped which comes in contact with them, burying their serrated suckers in its skin, so that they cannot be withdrawn without considerable force. If not taken off, they go on increasing in size, till they become as large as a horse-bean, or even larger. Whole herds of cattle sometimes perish from the exhaustion which they cause. Wet weather,

Harvest Bug
(*Leptus autumnalis*).

Dog Tick
(*Ixodes plumbeus*).

however, soon kills them, and an animal made to swim across a river, is almost freed from them at once. Travelers in the interior of Brazil are sometimes obliged to pick hundreds off their own bodies before retiring to rest for the night.—The Dog T. (*Ixodes plumbeus*) is common in Britain, abounding on ferns in fir plantations, &c., in many places in autumn, and attaching itself to dogs, oxen, and other animals, sometimes even to man. It is in form and size like a grain of linseed, oval, shining, reddish, with a pale margin. The body swells to the size of a small horse-bean after the T. has attached itself to an animal, and the wound is attended with much inflammation and pain. Tortoises have ticks peculiar to them, which adhere to their neck, and by the thickness of their leathery coat, are preserved from being crushed when the head is retracted. The sheep-tick is not a tick: see SHEEP-LOUSE.

TICKET OF LEAVE is a term which is properly applied only in regard to convicts in the Australian colonies. A kind of permit was given to them after a certain period of their sentences, if they could be trusted at large. It required the convict who held it to remain within a particular district. The term was afterwards popularly applied to the kind of document, called technically an 'order of license,' which sets a convict at large in the British Empire before the expiry of his sentence. The occasion of its being first used was when, after the year 1840, the colonies, one after another, refused to receive convicts. If those sentenced to transportation were kept in prison in this country for the whole period of sentence, its severity would be greatly increased; and hence, by way of compensation to the convicts not taken abroad, part of their sentence was remitted. On the form of the sentence being recently changed from transportation to penal servitude, the partial remission was made systematic, as an inducement to good conduct and industry. Under the existing act of 1864, the period of remission which may thus be gained is for males about a fourth, and for females about a third, of the whole sentence. The method of adjusting the period is by debiting the convict with so many marks, representing the amount of industry that must be accomplished to gain the largest period of remission; and according to the proportion of these gained is the amount of remission or order of license or ticket of leave. See CONVICT, PRISON DISCIPLINE.

TICKING, a strong cloth, used chiefly for making beds, mattresses, and paillasses. Formerly, it was always manufactured of linen, but cotton is now largely used for this purpose. A very general character of ticking is that it is woven in stripes of two colors, blue and white.

TICKNOR, GEORGE, an American scholar and author, born in Boston, August 1, 1791, educated at Dartmouth College, admitted to the bar in 1813, but devoted himself to literature. From 1815, he spent four years in Europe, residing at Gottingen, Rome, Madrid, Paris, Edinburgh, and London, where he made the acquaintance of the most distinguished men of letters. Returning to America, he became Professor of French and Spanish Languages and Literature in Harvard University. In 1835, resigning his professorship, he went with his family to Europe, where he remained three years collecting materials for his *History of Spanish Literature* (New York, 1849, 3 vols. 8vo), an exhaustive and admirable work, which has been translated into Spanish and German. Mr. T. also edited *The Remains of Nathaniel Appleton Haven*, and wrote a *Life of Lafayette*, first published in 1824 in the *North American Review*. He published in 1864 a biography of his friend W. H. Prescott, the historian. Mr. T. died in 1871. See *Life, Letters, and Journals of George Ticknor* (Boston, 1876).

TICONDERO'GA, a small township in New York, U. S., on Lake Champlain, enclosing the outlet of Lake George, 95 miles north-by-east of Albany; and the name also of a lofty promontory in the township, of which the extremity, Mount Defiance, rises 750 feet above the lake. The falls of the outlet of Lake George, 150 feet in 1½ miles, afford constant water-power for timber-mills; and a vein of graphite supplies 30 tons of fine blacklead a year. The promontory was fortified by the French in 1755. In 1757, Montcalm assembled here a force of 9000 men, with which he took the English fort, William Henry, on Lake George. In 1758, General Abercrombie, with 15,000 men, attempted to storm the French fort, then called Carrillon, but was repulsed, with a loss of 2000. In 1759, it was invested by General Amherst, and the French dismantled, and abandoned both this fort and Crown Point, which were then enlarged and strengthened by the English at a cost of £2,000,000. Being weakly garrisoned after the cession of Canada to Great Britain, it was, in 1775, surprised and captured by Ethan Allen. In 1777, it was recaptured by General Burgoyne, by erecting a battery on an unprotected height which commanded it; but after the surrender of Burgoyne, it was dismantled and abandoned. It was again occupied by the British troops in 1780, and at the close of the war, became a picturesque ruin.

TIDE-MILL. See WATER-POWER.

TIDES. It was known, at least as early as the time of Cæsar, though probably long before, that the time of high-water, and also the height of the tide, are in some way connected with the age of the moon. And even in the present state of science, what is called the *establishment* of a port, or the time of high-water at new or full moon (that is, the interval between the moon's crossing the meridian and the full tide), which is practically the most important part of the whole question, cannot be predicted by theory, but must be obtained by observation. The first attempt to explain the phenomena of the tides was made by Newton; and, considering the little that has, since his time, been effected, his approximate solution must be pronounced highly creditable, although in many respects unsatisfactory. D. Bernouilli and others have since slightly improved Newton's method; and a complete solution of the problem has been attempted by Laplace. The principles involved in this solution are undoubtedly correct, and the result, so far as it goes, leaves little to be desired. But it does not go far, for two reasons: we know very little as to the depth of the sea; and, even had we that knowledge, the excessive difficulties of the mathematical processes required in taking account of it, and of the forms of continents and islands, would be such as to render Laplace's method inapplicable.

Newton's approximate method consists in the study of the problem as a *statical* one, and this we will presently describe. Laplace, on the other hand, treats the problem as one of fluid *motion*. Airy and others have, more recently, attempted, with success, to simplify Laplace's process. Curiously enough, however, the results of all these theories are very much alike; and, while some of the results agree well with observation, others seem irreconcilable with it. We cannot explain Laplace's method without employing high analysis, quite unsuited to this work; so we must be content to describe the faulty theory.

In the Newtonian or *Equilibrium* Theory, we consider the earth to be spherical, and covered with a layer of water, which would, of course, if left to itself, be uniformly deep over the whole surface. The attraction of the moon (per unit of mass) on the water immediately below her, is greater than her attraction on the solid earth (per unit of mass), and tends, therefore, to raise the water at that part of the surface. At the point of the surface directly opposite to the moon, the water-layer is further from the moon than the bulk of the earth, and, consequently, the moon attracts the water (per unit of mass) *less* than it attracts the earth. The tendency is, as it were, to pull the earth away from the water, so that here also the water is raised, though not *quite* so much as on the other side, as the moon's attraction diminishes with distance. The effect of the moon's action on the previously uniform layer of water, is thus to elongate it both ways in the direction of the line joining the centers of the earth and moon. On account of the very small amount of this elongation, it is found by mathematical processes, which we cannot give here, that the form of the surface will become very nearly a prolate spheroid (a solid formed by the revolution of an ellipse about its *longer* axis).

[Before proceeding further with our explanation, it is necessary to say a few words with reference to a mistake often fallen into by those whose knowledge of mechanics is scanty; and at times paraded with a show of learning by a class of men who doubt such plain matters of fact as the moon's rotation, the oblateness of the earth, the inertia of matter, and what not. Such people say that, since, if the moon and earth were rigidly fixed to each other, the water would rise only on the side next the moon, this must be the case in nature also. This is the same mistake as those commit (see PERTURBATIONS) who allow that at new moon the sun virtually diminishes the moon's gravitation towards the earth, but refuse to allow that the same is true at full moon.]

We have next to consider that the moon revolves about the earth, and that the earth also revolves about its axis. Thus, the equilibrium figure has never time to form; but an imperfect form of it travels round the earth in the time of a lunar day (24 hours 54 minutes). If the moon be on the equator, it is obvious that similar portions of the water-spheroid will reach any one spot on

the earth at intervals of half a lunar day (12 hours 27 minutes). If the moon's declination be considerable, such will not be the case—a place, for instance, whose latitude is equal to the moon's declination, will be reached by one pole of the wave-spheroid when the moon is on the meridian; but in 12 hours 27 minutes, the other pole of the spheroid will not pass over the place, but at a meridian distance of twice the latitude of the place, or twice the moon's declination. Thus, when the moon's declination is sensible, the two tides of each day are not generally equal in height, except for places on the earth's equator. This gives rise to what is called the *diurnal* tide, which is, as it were, superposed upon the ordinary, or *semidiurnal*, tide and ought to be more sensible as the latitude is greater. Owing to fluid friction, and other causes, we should expect that the axis of the tidal spheroid would lag a little behind the moon, and this is found to be the case.

So far, we have a general explanation of the occurrence of tides twice a day, and of their dependence on the moon. But we started with two assumptions which are not consistent with fact, viz., that the earth is spherical and uniformly covered with water, and that the moon is the only tide-producing body. The corrections to be made in consequence of the inaccuracy of these assumptions, must now be explained. We commence with the latter. The sun, although at an immense distance compared with that of the moon, has such an enormous mass, that his tide-producing influence is comparable with that of the moon. In fact, it is easy to see that, as Newton showed, the tide-producing power of an attracting mass is directly as the mass, and inversely as the *cube* of its distance. That it is directly as the mass, is obvious. To prove the other assertion, let R be the earth's radius, D the distance of the attracting body from the earth's center, then the attraction per unit of mass on the earth is to that per unit of mass on the water nearest the attracting body as

$$\frac{1}{D^2} \text{ to } \frac{1}{(D-R)^2},$$

according to the law of gravitation. The difference between these quantities is proportional to the tide-producing force. But

$$\frac{1}{(D-R)^2} = \frac{1}{D^2\left(1-\frac{R}{D}\right)^2} = \frac{1}{D^2}\left(1+\frac{2R}{D}+\text{&c.}\right)$$

$$= \frac{1}{D^2}+\frac{2R}{D^3}+\text{, \&c., the remaining terms being omitted, since D}$$

is always much greater than R. The difference is therefore approximately

$$\frac{2R}{D^3},$$

as stated above.

Now the mass of the sun is to that of the moon as 355,000 to 0·0125, and the sun's distance is about 400 times that of the moon. Hence the tide-producing power of the sun is to that of the moon as

$$355{,}000 \text{ to } {\cdot}0125 \times 400^3$$
$$\text{or } 355 \text{ to } 800.$$

By calculations, which we cannot give here, it has been shown that the difference of length of the axes of the wave-spheroid produced by the moon alone is about 58 inches; so that in that due to the sun it will be about 25·7 inches.

In consequence of the extremely small amount of these effects on the sea-level, we are entitled to simply add or superpose the separate effects of the sun and moon, in order to obtain their joint effect. And now we have at once the explanation of what are called *spring* and *neap* tides. At new and at full moon, the wave-spheroids due to the sun and moon have their axes almost coincident, so that we have a tide which is to the lunar alone as 800 + 355 to 800, or as 13 to 9 nearly; while, when the moon is in her first or last quarter, the axes are nearly at right angles, and the compound tide is to the lunar tide alone as 800 — 355 to 800, or as 5 to 9 nearly. Thus, the height of the spring-tide is to that of the neap-tide in the ratio of about 13 : 5.

Another curious phenomenon, which we can now easily account for, is the 'priming' and 'lagging' of the tides, or the *acceleration* and *retardation* of the time of high-water. If the tides were due to the sun or moon alone, they would recur at equal intervals of time; and, in fact, this is the case with the lunar and solar tides separately. But what we observe is the compound tide, and this will obviously have its maximum *between* two consecutive maxima of the lunar and solar tides; but nearer to the lunar tide, as it is the greater. Thus, if about new moon the sun passes the meridian *before* the moon, the tide is accelerated; if *after*, it is retarded. And the same is true about full moon, only that in this case our statement refers to passages of the sun and moon on opposite sides of the meridian. This retardation or acceleration has for its greatest value a period of rather less than an hour; and the respective maxima occur about 4½ days before and after the spring-tides.

But we meet with far more serious difficulties when we come to consider the actual distribution of water over the earth's surface; and it is here that future improvements must be looked for.

But even so inadequate an attempt at a solution as is the equilibrium theory, gives us the means of explaining a great many curious observed phenomena. It shows, for instance, how exceedingly small we should expect to find the tides in an inland sea, such as the Mediterranean; for there, even when the moon is most favorably situated, the utmost difference of level would be (by calculations which we cannot give here) only about an inch or two; and of this, part would be the rise in one portion of the sea, the rest the fall in others. The popular explanation of this phenomenon is very simple. We have but to notice that, according to the equilibrium theory, the form of the water is a spheroid of definite dimensions, its axes differing from each other by 58 inches. But a small portion of such a spheroid (of the dimensions of the Mediterranean, for instance) can hardly be distinguished from a sphere; so that the form of the surface of a limited mass of water will be but slightly altered by the attractions of the sun and moon.

It is obvious from what we have just said, that the rise of the water in tidal rivers, estuaries, and deep bays, where it sometimes amounts (even in calm weather) to more than 100 feet, cannot possibly be due to the moon's action upon the water of the mere river or bay, but must be almost entirely produced by the tidal wave in the ocean; and, in fact, this part of the problem presents comparatively little difficulty. Once grant the fact of the tidal disturbance of sea-level at the mouth of a river, and the calculation of the motion of the consequent wave in the river-channel is within the power of mathematics. It is by means of investigations made from this point of view, and by others concerning the effect of the moon on long canals, that Laplace's method has been improved. For the details of the process, see Airy on 'Tides and Waves,' in the *Encyc. Metrop.* All we can do here is to point out a few of the immediate consequences of the periodic rise and fall of the sea-level as regards the motion of the water of a tidal river. Here the tide always runs *up* the river, even when, as in the case of the Severn, this is the opposite direction to that in which the moon appears to move. In the open sea at the mouth of the river, the interval from high to low water is almost exactly equal to that from low to high water, each being about 6¼ hours nearly. But the further we go up the river, the greater becomes the disparity between these periods, high-water following low-water at shorter and shorter intervals, while the intervals during which the tide falls are correspondingly increased. In some cases, as at certain points in the Seine and Severn, the interval from low to high water is so short that the tide-wave rushes suddenly up, and, spreading over the flat sands at the side of the channel, forms a dangerous surf called a *Bore* (q. v.).

Connected with these peculiarities, there is also a singular effect produced on the direction of the current in a tidal river. In the open ocean, the water merely rises and falls, there being no perceptible tidal current. Sailors are in the habit of associating the cessation of currents, or 'slack' water, with the occurrence of high and low water. This is the case in bays, but not in rivers, and it gives rise to some curious errors regarding the time of high-water in rivers. Thus it is sometimes said that it is high-water in the center of the Thames' channel long after it is high-water at the shore—an obvious absurdity. The truth is, the current does not cease simultaneously at the shore and in mid-channel. At the mouth of a tidal river, the water runs upwards for hours after high-water, and downwards after low; and the same is true, in a less degree, at places higher up the stream.

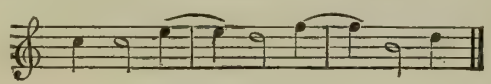
When considerable alterations of breadth or depth occur in the channel of a river, we find corresponding alterations in the amount of rise of the tide. Thus, according to Airy, at the entrance of the Bristol Channel, the whole rise at spring-tides is about 18 feet; at Swansea, 30 feet; and at Chepstow, 50 feet. At Annapolis, in the Bay of Fundy, the tide is said to rise 120 feet. Again, the same port may be reached by two tide-waves coming from the ocean by different channels; and here we have to compound the two disturbances just as we did with the separate lunar and solar tides. In the German Ocean, we have a very good example; but the most remarkable is the tide at Batsham, in Tonquin. At this port, two tide-waves meet, coming respectively from the Indian and China seas; these bring, simultaneously, opposite but nearly equal changes in the water-level, and the effect is, that there is almost no perceptible tide.

Whewell, Lubbock, and others, have lately added much to our knowledge of the *facts* of the tides; and have constructed what are believed to be tolerably accurate charts of *Cotidal Lines*—that is, lines representing the positions of the crest of the tide-wave at hourly intervals as it sweeps round the earth. A great deal, however, remains to be done in this direction, before we can hope to elicit from observation such hints as may enable us to improve the mathematical theory of the subject.

The frictional resistance to the motion of the tide-wave of course produces heat. This heat is a transformation of part of the earth's energy (see FORCE) of rotation; and thus it appears that the tides are gradually lengthening the day. We may see easily that this would go on, were the moon the only tide-producing body, so long as the earth rotates about her axis in less time than a lunar month. For, if the length of the (sidereal) day were that of a lunar month, the earth would always turn the same face to the moon; and the tide-spheroid would have a *fixed* position on the earth, and there would be no loss of energy by friction. Simple as this deduction is, though it seems to have been roughly guessed at by Kant, it was not formally enunciated till about thirty-five years ago. Mayer was the first to publish anything on the subject, but it seems to have been previously noticed by others. One of the most curious deductions from it is the recent speculation which assigns, as the cause of the moon's turning always the same face to the earth, the friction of the enormous tides which must have been produced by the earth in her mass when it was in a molten state, on the surface at least, if not throughout.

For tidal evolution and the theory, based on Dr. G. H. Darwin's calculations, that in early geologic times the size of the tides was vastly greater than at present (owing to the greater nearness of the moon), see *Nature*, vols. xxv., xxvi.

TIE, in Music, an arch drawn over two notes on the same degree, uniting them so that they are played or sung as one single note of the same value. Thus, for the two C's written in the example  one is played of the value of a minim and quaver combined. The tie is often used in syncopated passages to connect the last note of one measure with the first of the succeeding one, when the former note, which would otherwise be unaccented, acquires the emphasis of the latter:



See SYNCOPATION.

TIE-BEAM. See ROOF.

TIECK, LUDWIG, a brilliant and prolific German novelist and poet, was born at Berlin 31st May 1773, and studied at the universities of Halle, Göttingen, and Erlangen. He made his first appearance as an author in the *Straussfeder* (Ostrich-feather) Magazine, conducted by Musäus (q. v.) and J. G. Müller, for which he wrote a series of little tales, of which the best was *Die beiden merkwürdigsten Tage aus Siegmann's Leben* (The Two most Remarkable Days in Siegmann's Life). But the originality of his genius first displayed itself in his romances of *Abdallah* (Berl. 1795) and *William Lovell* (3 vols., Berl. 1795). These were followed by his *Peter Lebrecht, eine Geschichte ohne Abenteuerlichkeiten* (Peter Lebrecht, a History without Adventures, 2 vols., Berl. 1795—1796), and *Peter Lebrecht's Volksmärchen* (3 vols., Berl. 1797), which were equally remarkable for richness of fancy, artless simplicity, and an overflowing humor. In some of these *Märchen*, as, for example, his 'Bluebeard,' 'Puss-in-Boots' (*Der gestiefelte Kater*) and 'The Life and Death of Little Red Ridinghood' (*Leben und Tod des kleinen Röthkappchen*) he combated with satiric humor, perhaps, too, with somewhat of youthful arrogance, the 'enlightened' notions on which the literature of the 18th c. prided itself—showing very distinctly his strong tendencies towards the deeper poetic spirit of the middle ages. The same polemic was maintained in his comedy, *Die verkehrte Welt* (The Topsy-turvy World, 1799). To this period also belong his *Herzensergiessungen eines kunstliebenden Klosterbruders* (Heart-effusions of an art-loving Monk, Berl. 1799), *Franz Sternbald's Wanderungen*, an art-novel (2 vols. Berl., 1798), and *Phantasien über die Kunst* (Fancies on Art, Hamb. 1799), all of which are full of a noble enthusiasm for art, but pervaded at the same time by a dreamy mystical religiosity, which is no longer admirable. These works brought T. into close relationship with A. W. von Schlegel and others, and led to the establishment of the literary sect or coterie known as the 'Romantic School,' whose influence on the later literature of Germany and France has been very great, and not always very good.

T. now married the daughter of a Hamburg clergyman who had been a friend of Lessing; and in 1799 went to Jena, where he added Steffens to the list of his friends. Here he published his famous *Romantische Dichtungen* (2 vols., 1799—1800). His translation of *Don Quixote* (4 vols., Berl. 1799—1801, 3d ed. 1831) far surpassed all previous attempts. In 1802, he joined A. W. von Schlegel in the *Musen-Almanach;* and in 1804 published his longest romance, *Kaiser Octavianus*. T.'s health now began to fail him, and in 1805 he visited Italy. On his return to Germany, he settled, after some changes, at Ziebingen in 1811, where he formed a friendship with the philosopher Solger, who exercised a great influence over his mind. Henceforth, we find less of the dreamy and formless mysticism of his earlier years, and more of the artistic element. The change becomes visible in his *Phantasus* (3 vols., Berl. 1812—1815), and in his *Ulrich's von Lichtenstein Frauendienst* (Tüb. 1815). In 1817, along with a friend Burgsdorf, he paid a visit to England, where he collected fresh materials for his Shakspeare. From 1819 to 1840, he resided at Dresden; but on the accession to the throne of Friedrich Wilhelm IV. of Prussia, he was invited to Berlin, whither he proceeded, and where he resided for the rest of his life. His death occurred 28th April 1853. Other important works of T.'s besides those already mentioned, are his *Novellenkranz* (Berl. 1831—1835; complete in 12 vols., Berl. 1853); in which there is hardly a trace of the credulous Romanticism of his earlier years, but abundance of lively and subtle talk on the literature and life of the Present; *Dramaturgische Blätter* (2 vols., Bresl. 1826), republished in his *Kritische Schriften* (4 vols., Leip. 1848—1852); *Shakspeare's Vorschule* (2 vols., Liep. 1823—1829); and his splendid continuation of Schlegel's translation of our great poet. T. revised a collected but incomplete edition of his works in 20 vols. (Berl. 1828—1842). —See Köpke's *Life of Tieck* (2 vols).

TIEL, the seat of an arrondissement in the Netherlands, province of Gelderland, is picturesquely situated on the right bank of the Waal. In the 5th c., it was called Tellum or Thiela. The fortifications have been demolished, and formed into beautiful walks. Pop. (1879) 8933. Principal buildings are the Townhouse, Court-house, Chamber of Trade, and the great Reformed Church of St. Martin.

T. has a good haven, and large trade in agricultural produce and cattle. It imports grain, earthenware, wood, lime, coal, bricks, salt, &c.; and exports potatoes, grain, colza, pigs, flax, apples, cherries, &c. Principal industries are copper-founding, brick-making, tanning, book-printing, paper-making, beer-brewing, &c.

TIEN-TE (celestial virtue), the name given to the *Tae-ping-wang* (king of universal peace), the pretender to imperial authority in China, and the head of the mighty insurrection which for 16 years convulsed that country. See CHINESE EMPIRE and TAE-PINGS. The insurrection was under the direction of five chiefs, Hung-sew-tseuen, Hiang-tsew-tsing, Siao-tsha-kuei, Fung-hien-san, and Wei-tsing, independent of each other, but all acknowledging the supremacy of T.; and as, according to the plan of the rebellion, China, after being delivered from its Mantchu rulers, was to be divided among those chiefs, each of them assumed beforehand the title and insignia of 'king.' So little reliable were the statements which were forwarded to Europe respecting this insurrection, that for some time Hung-sew-tseuen, the chief among the five kings, and the military leader of the rebels, was confounded with their supreme head.

TIEN-TSIN, a large and important city and river-port of China, in the province of Chih-le, on the right bank of the Pei-ho, 34 miles from the mouth of that river by land, and 68 miles by the windings of the stream. It is the port of the city of Pekin, from which it is distant 80 miles south-east. The streets are unpaved, and the houses, principally built of mud or dried bricks, have a mean appearance, though the central parts of the town are filled with well-built houses. The maximum of heat in the summer is 106°, the maximum of cold is 6° below zero. The river is generally frozen over from about the 15th December to the 15th March, and the business at other times carried on by means of boats and junks, is taken up by sledges, which swarm on the river. By the Treaty of T., signed here November 1858, and by the subsequent Convention of Pekin, October 1860, the port was declared open; and a British consulate was established in January 1861. In 1881, T. was connected by telegraph with Shanghai (the line extending to Pekin). In 1881, T. had 435 vessels of 260,337 tons. In 1881, the value of the imports was £6,452,057; of the exports, £763,040. In 1875, the imports amounted to £4,610,677; the exports to £506,936. There is also a large and rapidly increasing transit trade with Russia *viâ* Siberia, tea to the value of £906,914 having been forwarded in 1875 from T. overland to Russia. The principal articles imported are opium, shirtings, chintzes, and other cotton goods; needles, window-glass, sugar (brown and white), and paper. The chief exports are peas and dates. Pop. reckoned at 1,000,000.—*Reports of Her Majesty's Secretaries of Embassy and Legation* (1866); and *Commercial Reports from Her Majesty's Consuls* (1875).

TIERCE. See FENCING.

TIERCE, TIERCÉ, in Heraldry, a term of blazon used to indicate that the field is divided by lines into three equal parts. A shield may be tiercé in pale, in fess, in bend, in bend sinister, or in pall; all which, with other arrangements in tierce, are common in French heraldry. Tierce in pale, in English heraldry, is an

occasional mode of marshalling three coats in one escutcheon under special circumstances.

TIE'RRA DEL FUE'GO (Land of Fire), an archipelago situated at the extreme south of South America, from the mainland of which it is separated by Magellan's Strait, consists of 11 large islands, of which the chief is King Charles's South Land, and about 20 islets; lat. 52°—56° S., long. 65°—75° W. The area of King Charles's South Land, which forms more than three-fourths of the entire area, is about 21,260 sq. m. This island, like the other islands of the archipelago and the coast of the mainland, is much broken on the west side by gulfs and inlets. The eastern coasts are, as a rule, level and wooded; while the western coasts are generally rocky and mountainous. The general aspect of the group is wild and desolate in the extreme. Some localities, however, are of quite a different character. The coast-scenery of Picton Island resembles that of the south-west coast of England. The south part of the island is chiefly in moor and down; the north part is covered with thick forests. The scenery is fine, and there are fine freshwater lakes, frequented by abundance of waterfowl. Many of the mountains are volcanic—from which circumstance this region has derived its name—and lava and volcanic productions are seen everywhere. The highest mountains rise to from 6000 to 7000 feet, and are covered with snow. The climate is raw and cold, violent rains and snowstorms occurring in every season of the year. In this region, the waters of the Atlantic and Pacific meet and struggle together, and terrific tempests are frequent. The flora of the region comprises some plants found in Great Britain. Wild celery and spoonwort are the only edible plants; but by far the most important articles of food are shellfish, which abound on the coasts, and a globular fungus, which grows in clusters round the trunk of the antarctic beech—an elegant evergreen, and the prevailing tree in the archipelago. The inhabitants, the number of whom is estimated at 2000, are generally described as a short, ugly, beardless race with long black hair, of a rusty iron color, and occupying the lowest rank in the scale of civilization. Captain W. Parker Snow, who visited T. del F. in 1855, reports somewhat differently of the inhabitants. According to him, the natives are robust-looking, powerful, and of the middle height, being on an average over 5 feet 3 inches in height. The only quadruped among them is the dog. When driven to extremities, they first eat their dogs, and then kill and eat the old women of their tribe. More than one attempt has been made to convert these savages to Christianity, but hitherto such attempts have proved abortive.

In 1850, a mission-party of seven men, under Captain Allen Gardiner, the projector of the expedition, arrived at Tierra del Fuego. The missionaries were not well received by the natives, and the narrative of their residence on these coasts is simply a record of miserable disasters. Owing to the grossest mismanagement on the part of the home authorities, the wants of the mission-party were neglected, and they found themselves in a short time destitute of provisions. The relief that had been promised never came; and in the autumn of 1851, the whole party, after undergoing horrible sufferings, died of starvation. In the autumn of 1854, another missionary expedition set sail from Bristol for T. del F., under command of Captain W. Parker Snow; but after many endeavors, the attempt to form a mission-station on T. del F. was abandoned.

TIERS ETAT (Fr. third estate), the third branch of the French estates, which consisted of representatives of the trading inhabitants of the towns, and of the peasantry in the country. The *tiers état* played an important part in the opening scene of the Revolution. On the two other estates of nobles and clergy refusing to join them and deliberate in a common chamber, they, on June 17, 1789, assumed the title of *Assemblée Nationale*, and the sole right to legislate for France. The French *tiers état* differed completely in its origin from the third estate or Commons of England. The latter originated in the permission granted to the minor barons, instead of personally attending the national council, to appear by representatives; and with the representatives of the minor barons were joined in one house the representatives of the municipalities, which, as corporations, came to be considered in the light of tenants *in capite* of the crown. The designation 'Commons,' and the absence of title have often misled foreigners to suppose that the men who gained their liberties and constitution for the English people were the *roturiers* or *bourgeois;* whereas they mostly belonged to the class which would, in continental phraseology, be called the nobility of the country.

TIETJENS, or TITIENS, TERESA, one of the greatest of recent operatic singers. She was born at Hamburg, of Hungarian parents, in 1834, and made her *début* in that city in the character of Lucrezia Borgia in 1849, taking at once a very high position on the lyric stage; at Frankfurt and Vienna she was even more warmly received; and her first appearance in London, in 1858, was quite a triumph. The great volume and purity of her voice, and her energetic but dignified acting, combined to make her an unrivaled representative of strong dramatic parts. She acquired great fluency and flexibility of voice by hard practice. She was probably the hardest-worked singer that has appeared; and though this did not seem to injure her voice, it doubtless wore out her constitution. She died 3d October 1877.

TI'FFANY, a kind of very thin silk gauze.

TI'FLIS, a government of the Russian lieutenancy of Caucasia, lying immediately south of the Caucasus. Area, 15,553 sq. miles; pop. (1873) 660,800, chiefly Georgians, Armenians, and Tartars. It is traversed by several chains of mountains, which belong either to the Caucasian Mountains (the peak of Kazbeck, 17,500 feet high), and extend over the north and east parts of the government, or to the Ararat, Achaltzick, and Alagiz Mountains, spreading from the sources of the Kur and Arax over the south districts. The principal lake, that of Goktcha, is about 50 miles long, and nearly 20 miles in extreme breadth. The rivers, the chief of which are the Kur and Arax, rise amid mountains, are very rapid, are confined between high banks, and are not navigable. The climate varies with the varieties of elevation of the surface; the soil, very fertile in some tracts, is not in general cultivated. Grain, tobacco, cotton, indigo, vegetables, and grapes are produced abundantly. T. is rich in mineral springs and in timber, the principal trees being the oak, elm, chestnut, and maple. The Christian and Mohammedan are the predominant creeds.

TIFLIS, an important Russian city, capital of the government of the same name and of the territory of the Caucasus (and south of the mountain range of that name), stands on both banks of the Kur, 165 miles—direct line—east-south-east of the Black Sea. There are several manufactories, in which woollen and linen cloths, carpets, and arms are made. T. was formerly a fortress, and the capital of the district of Georgia. It carries on an active trade with Persia, and is the great emporium of the Russian territory south of the Caucasus. In the vicinity are naphtha springs as well as thermal springs, which are much visited. T. was founded in the 4th c., and annexed to Russia in 1802. Pop. (1876) 104,024, mostly Armenians.

TIGER (*Felis tigris*), one of the largest of the *Felidæ*, equal perhaps to the lion in size and strength, and superior in activity. It has no trace of mane. It is more slender than the lion, its whole form more cat-like, its head smaller and rounder. All its

Head of Bengal Tiger.

motions are performed with the utmost grace and apparent ease. It does not climb trees, but winds its way through brushwood or jungle with great dexterity, runs very swiftly, and can leap an immense distance. It takes its prey either by running, or, more frequently, by lying in ambush and leaping upon it. Its strength is such that it is capable of carrying off an ox or buffalo. It is sometimes 15 feet in entire length to the tip of the tail; an instance is on record of 18 feet; the height is from 3 to 4 feet. The tigers of some regions differ considerably in size from those of others; thus the T. of Bengal is much larger than that of Bokhara. The hair is thick, fine, and shining; in the colder countries which the T. inhabits, it is thicker and longer than in tropical regions. The color is a bright tawny yellow, beautifully marked with dark transverse bands, passing into pure white on the under parts; the dark bands are continued as rings on the tail. The tail is long, slightly tapering, clothed with hair similar to that of the body. Individuals sometimes occur, of a pale whitish color, obscurely striped, the stripes only visible in particular lights.

The T. is found only in Asia. It abounds in Hindustan, in the Eastern Peninsula, in Java, Sumatra, and other tropical islands. It is found also in China and Japan, and in Persia. Its range, however, does not extend much to the west of a line drawn from the mouth of the Indus to the Caspian Sea. It is found as far north as the south of Siberia, and even on the banks of the Obi. It inhabits woods, and cannot exist without free access to water. The islands of the delta of the Ganges have long been celebrated as a haunt of tigers. The T. generally lies concealed in a thicket during the day, and seeks its prey by night. The prey is very often obtained by watching near the places to which animals resort for the purpose of drinking. Tigers prowl about villages, and enter cattle-folds; they also follow traveling-parties, and seize

the yoke-oxen and buffaloes, particularly those which straggle away from the encampment at night. The ravages of tigers in some parts of the East Indies are very great; and a great number of human beings are destroyed by them. A notion prevails that a T. which has once tasted human flesh becomes eager for it, and prefers it to all other food; and a single T. has been known to kill

Bengal Tiger (*Felis tigris*).

and devour many people, watching near some frequented path, or prowling around a village. The truth appears to be that this is the mode of obtaining prey to which a T. sometimes resorts, when incapable, through old age, of the active exertion necessary for capturing buffaloes or deer. The T. brings forth three, four, or five young ones at a birth. When taken young, it is easily tamed, and often shows much affection for those who treat it with kindness. Tame tigers are not unfrequently to be seen in India.

The T. was less familiarly known to the ancients than the large African *Felidæ*. It is, however, mentioned by Aristotle, and it is frequently mentioned by the Latin poets. Pliny tells us that the first T. seen at Rome was a tame one belonging to Augustus. Claudius exhibited four tigers at once.

The T. frequently breeds in captivity, but not so frequently as the lion. A hybrid between the lion and T., the offspring of the male lion and the tigress, has been sometimes produced in menageries. It is striped like the T., and not maned. None of the hybrid cubs, however, have lived long.

Tiger-hunting is a favorite Indian sport, not unattended with danger, but all the more exciting on that account. Europeans generally ride on elephants when engaged it it, and the T. is shot from the back of the elephant. Natives, however, are employed to beat the wood or jungle for the T., and lives are not unfrequently lost in this way. During the decade 1870—1880, over 800 persons in all, and 16,000 cattle, were sometimes killed in a year by tigers; while 16,000 tigers were slain by native hunters (about £4000 being paid for rewards), without reckoning those killed by English sportsmen. Tigers are now less numerous than they were. Many expedients are adopted for their destruction in the countries infested by them. Bows with poisoned arrows are fixed in their paths, so as to be discharged on being touched. Heavy beams are also so placed as to fall upon the T. pressing against a rope, and crush it by their weight. Traps of various kinds are set, sometimes baited with a live goat or other small animal. The Chinese use a box-trap with a looking-glass placed in it, and the T., attracted by his own image, disengages the fastening of the lid, and is captured. This method is very ancient, and is represented in ancient sculpture. A very curious mode, practised in Oude, consists in scattering numbers of broad leaves smeared with a substance like bird-lime in the tiger's path, and if he sets foot on a smeared leaf, his fate may be regarded as sealed. He rubs his paw on his face, to get quit of the leaf, and the case becomes worse, the leaves are transferred to his face; fresh attempts to remove the nuisance only add more leaves, till he becomes completely blinded, and rolls on the ground for very rage; while the hunters, ambushed close by, apprised by his howlings, hasten to despatch him.

The T. is an emblem of power in the East. A tiger's head, georgeously adorned with jewels, decorated the throne of Hyder Ali and Tippoo Sahib, and was among the spoils taken by the British at Seringapatam.

TIGER-CAT, a name often given to some of the *Felidæ* of middling size, which resemble the tiger in their form or markings. The Ocelots (q. v.) and the Serval (q. v.) sometimes receive this name, which, however, is not of very definite signification. The CHATI (*Felis mitis*) is a tiger-cat of South America, rather more than two feet in length, exclusive of the tail, which is about eleven inches. The color is yellowish, with irregular dark patches, those on the back forming four longitudinal rows; the markings, indeed, more leopard-like than tiger-like. The chati prowls by night, and often carries away poultry from their roosting-places. Almost all tropical and sub-tropical countries have their tiger-cats. Several species are found in the East Indies.

Tiger-cat, or Margay (*Felis tigrina*).

TIGER-FLOWER (*Tigridia pavonia*), a plant of the natural order *Iridaceæ*, the only known species of its genus, which is distinguished by the three outer segments of the perianth being larger, and by the filaments being united into a long cylinder. It is a native of Mexico, but hardy enough to endure the climate of Britain, and much cultivated in flower-gardens for the singularity and great beauty of its flowers, which are, however, very evanescent. The root is a scaly bulb.

TI'GRIS (Heb. *Hiddekel;* i. e., the 'Dekel,' equivalent to *Digla* or *Diglath*, probably a Semitic corruption of *Tigra*, Medo-Persic for an arrow; hence Gr. *Tigris*, the 'arrowy' stream), a large river of Asiatic Turkey, rises south of Lake Goljik, in the mountains of Kurdistan, within a few miles of the eastern bend of the Euphrates (q. v.), flows south-east to Diarbekir, after which it makes a sharp turn, and flows due east for 100 miles to Til. Here it receives from the north a considerable affluent, the Bitlis, and once more altering its course, runs in a south-easterly direction through desert wastes and unpeopled pastures, until it falls into the Persian Gulf, after a course estimated at 1150 miles. Its chief tributaries, besides the Bitlis, are the Great and Little Zab, and the Dyala, all from the left, the waste land between it and the Euphrates (ancient Mesopotamia) not furnishing a single stream. At Kurna it joins the Euphrates, 90 miles above the mouth of that river in the Persian Gulf, and henceforth the united rivers bear the name of Shat-el-Arab (see EUPHRATES). In the upper part of its course, the T. is a very swift stream, whence probably its name, and it brings down great quantities of mud. The principal places on its banks are Diarbekir, Mosul, and Bagdad, with the ruins of Nineveh, Seleucia, and Ctesiphon.

TI'LBURG, a flourishing trading and manufacturing town in the Netherlands, province of North Brabant, is 15 miles south-west from 'sHertogenbosch, and 14 east-south-east of Breda. In 1879, pop. 28,390, having more than doubled in 50 years. This prosperity began with King William II., when Prince of Orange, and commander of the army, taking up his headquarters at T., during the long contest which ended in the independence of Belgium. Much heath has been converted into arable and pasture lands, and numerous brick-works and woollen-cloth factories have arisen. In 1847, there were 13 wool-spinning works with steam-power; they now number 37, and the workers have increased from 2900 to 5000. The workmen's houses have each a strip of land attached, for the growth of vegetables and potatoes. Weaving woollen cloth, spinning, finishing and dyeing woollen fabrics, making soap, salt, tiles, bricks, and beer, are the principal industries. The chief buildings are the new palace, the town-house, the barracks, and the cloth-hall. T. has a high school with a course of five years, a drawing-school, and several charitable institutions. The people are nearly all Roman Catholics. The town is mentioned as early as 709.

TI'LBURY FORT, in Essex, is situated on the north bank of the Thames, opposite to Gravesend. Originally erected in the time of Henry VIII. as a block-house, it was converted (1667) into a regular fortification after the bold expedition of De Ruyter into the Thames and Medway. It is of a rectangular form, built chiefly of brick, with a massive stone portal, and is surrounded by a deep and wide fosse, which can easily be filled with water. Batteries of heavy ordnance are placed so as to command the river and the reach below; there are also piers for the landing of troops, stores, &c. The banks of the Thames being here very flat, the ground around the fort is during floods and high tides laid under water. The East and West India Dock Company began extensive new docks here in 1881.

TILES (Lat. *tegula*, from *teg-*, to cover; Fr. *tuile*), plates of baked clay, of various shapes, according to their use, some being for roofs, some for pavements. The finer kinds of paving-tiles are known as Encaustic Tiles (q. v.). The small cubical pieces of burnt clay, stone, glass, or other material used for mosaic pavements, are called tesseræ (Gr. *tessares*, four). See MOSAIC. Besides ornamental tiles, much improvement has been lately affected by various manufacturers in the different kinds used for roofing purposes, especially by the use of fire-clay, by which a tile is

made not only greatly superior in strength and durability, but also in sharpness of form and diminution of thickness. Ridge-tiles of a very ornamental character are also largely made. Drain-tiles have been described under the head of PIPES.

TI'LESTONES, the uppermost group of the Silurian period, consisting of a reddish, thin-bedded, slightly micaceous sandstone, which in some places attains a thickness of 1000 feet. The beds were originally considered as of Old Red Sandstone age; then they were regarded as a transition group, forming a passage from the Silurian strata to the Old Red Sandstone; but it is now ascertained that the fossils agree in great part specifically, and in general character entirely, with those of the underlying Upper Ludlow Rocks, and they are accordingly considered to be the newest group of the Upper Silurian division. The Tilestones are well seen at Kington in Herefordshire, and at Downton Castle near Ludlow, where they are quarried for building purposes. From the latter locality, they have received the name of the Downton Sandstones.

TILIA'CEÆ, a natural order of exogenous plants, of which nearly 400 species are known, mostly trees and shrubs, with a few herbaceous plants. They are mostly natives of the tropics. A few are found in the temperate parts of the northern hemisphere. They have simple, alternate leaves, with stipules, and axillary flowers. The calyx is usually of four or five sepals; the corolla, of four or five petals. The corolla is sometimes wanting. The stamens are generally numerous, hypogynous, distinct; the outer ones sometimes abortive and petal-like. The ovary is composed of 2—10 carpels; there is one style, and the stigmas are equal in number to the carpels. As the characters somewhat correspond with those of *Malvaceæ*, so do the properties of the order, which are generally mucilaginous and wholesome, the bark fibrous. Some yield a light and useful timber, as the Lime (q.v.) or Linden tree, a well-known European representative of the order, the Halmalille (q.v.) of Ceylon, the *Grewia elastica* of India, and the *Luehia divaricata* of Brazil. The *bast* of the lime-tree is valuable from its fibrous character; that of the species of Grewia is used in the same way in India, and that of all the species of *Apeiba* in South America. The most important fibrous plants of the order, however, are the species of *Corchorus* (q. v.), which yield Jute (q. v.).

TILL, a term employed, chiefly in Scotland, for the Boulder-clay (q. v.). See also PLEISTOCENE.

TILLA'NDSIA. See BROMELIACEÆ.

TILLEMONT, SEBASTIAN LE NAIN DE, the well-known ecclesiastical historian, was born at Paris, November 30, 1637. His father was Jean le Nain, who held the office of *Maître des Requêtes*, the title, De Tillemont, by which the historian is commonly known, being derived from a small estate near Vincennes, which belonged to his family. He was educated at Port Royal, where he early imbibed those serious and rigorous views of the spiritual life which characterized the members of that celebrated society. His theological studies were marked from the first by a spirit of inquiry into the writings of the Fathers; and he is said to have begun as a student those analyses of the works of the Fathers, especially of the Apostolic Fathers, which form the staple of the early volumes of his History. Naturally of a timidly scrupulous disposition, he hesitated long about the choice of a profession; but after various changes of life, he at last received sub-deacon's orders in 1672, being then 35. He deferred his ordination as deacon till the end of 1673; nor was it till 1676 that he was ordained a priest, mainly at the persuasion of his friend, Le Maistre de Sacy, who had long been his spiritual adviser, and with whose attachment to the Jansenistic principles he sympathized at least to a certain extent. In 1679, T. took up his residence at his family estate of Tillemont, where he resided till 1681. In that year, he made a visit to Holland and the Low Countries for the purpose of visiting Arnauld and the other Jansenist refugees. He was induced, in the following year, to undertake a parochial charge—that of St. Lambert; but he held it only for a short time.

During these years, he had steadily pursued the historical studies which he had commenced almost during his school-days; and he had now prepared the first portion of his long-projected work on the History of the Church. He was induced, on the very eve of printing, to change the plan of the work. In order to avoid the opposition of the censor, to whom, as a theological work, it would have been necessary to submit it in its first form, and whose suspicions were aroused by the known association of T. with the Jansenist party, T. separated from the Church History the History of the Emperors, which he was enabled to print as a distinct work, without referring it to the censorship, under the title *Histoire des Empereurs* (6 vols., 4to, 1690). The success of this work disarmed the opposition of the church authorities.

The hostile censor was replaced by a less exacting one; and eventually, in 1693, the first volume of the Church History appeared under the title *Mémoires pour servir à l'Histoire Ecclésiastique des six Premiers Siècles* (16 vols. 4to). Neither of these works, however, was completed during the author's lifetime. Only four out of the six volumes of the *Emperors*, and four out of the sixteen of the *Histoire Ecclésiastique*, were printed under his own care. The remaining volumes were completed by him, but did not appear till after his death. The *Emperors* comprises all the reigns from Augustus to Anastasius (518); the *Histoire Ecclésiastique* comes down to about the same period. The plan of both is very much the same, being in great part a compilation of the original writers, as far as possible in their own words, but arranged with great skill and judgment, and linked together by such explanations and such a chain of narrative (within brackets) as is necessary to render them intelligible, and to cary on the course of events in a connected recital. Both these works have maintained, even to this day, their reputation for learning and impartiality; and even in the acrimonious contests of the 17th c., there was but litle impeachment of T.'s orthodoxy, so far as the Histories are concerned. His other writings, left in manuscript, were for the most part used as materials by later compilers. Some of his letters have been appended to his *Life*, published by his friend Tronchet, canon of Laval (Cologne, 1711). T. died at Paris on the 10th January 1698, having just entered upon his 61st year. The extent and accuracy of his erudition are still freely acknowledged, and his authorities have supplied the materials of most of the church histories compiled since his time.

TILLER. See HELM.

TILLICOU'LTRY, a manufacturing town of Scotland, beautifully situated in the county of Clackmannan, on the Devon, nine miles east-north-east of Stirling, with which it is connected by railway. There are large manufactures of shawls and plaidings. Pop. (1871) 3745; (1881) 3732.

TILLOTSON, JOHN, Archbishop of Canterbury, was the son of a clothier, and was born at Sowerby, in Yorkshire, in 1630. His father, Mr. Robert Tillotson, was a zealous Puritan—a circumstance that is not a little curious, when we consider that the son ultimately turned out the most catholic churchman of his age. T. studied at Clare Hall, Cambridge, where he took the degree of B.A. in 1650, and of M.A. in 1654. The writings of Chillingworth are said to have exercised a powerful influence on his mind during his university curriculum; but he owed not less to his friendly intercourse with Cudworth, More, Rust, Smith, Wilkins, and other eminent scholars. In 1656, he became private tutor in the house of Edmund Prideaux of Ford Abbey, Devonshire, Attorney-general under the Protector, but appears to have returned to London shortly before Cromwell's death. At what time T. entered into orders, or who ordained him, is not known, but he was a preacher in 1661—attached apparently to the Presbyterian party in the Church of England, for at the famous Savoy Conference (q. v.) he was present on the Presbyterian side; but he submitted at once to the Act of Uniformity (1662); and in December of that year, was offered the church of St. Mary Aldermanbury, London, of which Edmund Calamy had been deprived; but declined it. In 1663, he was appointed to the rectory of Keddington in Suffolk; but almost immediately after, was chosen preacher at Lincoln's Inn, where his mild, evangelical, but *un*doctrinal morality was at first little relished. 'Since Mr. Tillotson came,' said the Benchers, 'Jesus Christ has not been preached among us.' However, as the graces of his character gradually displayed themselves, his popularity increased, especially when it was found, that although not a Puritan, he was nevertheless averse to atheism and popery.

In 1664, he published a sermon *On the Wisdom of being Religious;* and in 1666, *The Rule of Faith*, in reply to a work by an English clergyman named Sargeant, who had gone over to the Church of Rome. About the same period, he took the degree of D.D.; and in 1670, was made a prebend of Canterbury. Two years later, he was promoted to a deanery; and in 1680, published a somewhat notable sermon entitled *The Protestant Religion vindicated from the Charge of Singularity and Novelty*, in which he advanced the proposition, untenable by a Protestant, that 'no man is at liberty to affront (i. e., to attack) the established religion of a nation, though it be false.' This proposition he subsequently, on reflection, abandoned. Along with Burnet, he attended Lord Russell during his imprisonment for complicity in the Rye-house Plot; and on the accession of William III., rose high into favor. In 1689, he was appointed Clerk of the Closet to the king; and in April 1691, was raised to the see of Canterbury, vacant by the deposition of Sancroft (q. v.), after vainly imploring William to spare him an honor which he foreboded would bring him no peace. Nor was he mistaken in his painful presentiment. The non-juring party pursued him with unrelenting rage to the end of his life; but their animosity could not extract one murmur of complaint, or one vindictive retaliation from the meek, humane, and tolerant primate. He did not long enjoy his dignity, dying of palsy, 18th November 1694, at the age of 65. A collected edition of his *Sermons* was published after his death by his chaplain, Dr. Barker; and has been frequently reprinted. They were translated into German by Mosheim; and were long highly popular on account

of their clear, solid, and refined thought, their easy eloquence, and their humane and moral piety. T.'s life was written by Dr. T. Birch (Lond. 1752).

TILLY, JOHN TZERCLAS, COUNT OF, one of the greatest captains of the 17th c., was born in 1559, at the château of Tilly in Brabant. A pupil of the Jesuits, his natural sternness of character inclined him to embrace their fanatical ideas; and this bent of mind was fixed by the examples of Alba (q. v.) and Requesens, under whom he was initiated into the art of war in the Low Countries. After a term of distinguished service in Hungary against the Turks, he was appointed (1609) by Duke Maximilian of Bavaria to reorganize his army, but resigned this post to take the command of the Catholic army at the outbreak of the Thirty Years' War (q. v.), and in conjunction with the Duke Maximilian gained (8th November 1620) the battle of Prague which dissipated the ambitious dreams of the Elector-palatine. During the course of this war, he separated, by able strategy, the armies of Mansfeld and of the Markgraf of Baden, beat the latter at Wimpfen, expelled Christian of Brunswick from the Palatinate (1622), defeating him at Höchst (22d July 1622) and at Stadion (August 1623); the latter conflict, which was of the most desperate character, lasting for three days. Created a count of the empire, he was next opposed to the king of Denmark, whom he conquered at Lutter (17th August 1626), and in conjunction with Wallenstein, compelled to sign the shameful treaty of Lübeck (1629). In the following year, he succeeded Wallenstein as commander-in-chief of the imperial forces, and took by storm the town of Magdeburg (10th May 1631). The unheard-of atrocities which he allowed the Croats and Walloons of his army to perpetrate on this occasion, have affixed to his otherwise high reputation, a foul blot, ineffaceable by all the cosmetic arts of his numerous apologists.

On the 14th May, he made a solemn entry into the ruined city, attended the celebration of a *Te Deum* in the cathedral, and then sent to the emperor a despatch in which occurs the remarkable passage: 'Since the capture of Troy, and the destruction of Jerusalem, a victory such as this has never been seen!' From this time, however, fortune deserted him; for his next opponent was the great Gustavus Adolphus, who completely routed him at Breitenfeld (17th September 1631); and though, in the following spring, he obtained some minor successes over the Swedish general Horn, the king speedily forced him to retreat behind the Lech in Bavaria, and (5th April) forced the passage of the river right in his front, after a desperate conflict, in which T. was mortally wounded. He was removed to Ingolstadt, where he died 30th April 1632. T., the victor in 36 battles, was reckoned the best general of the time till his defeat by the Swedes; he was small in stature, and of a meagre habit of body, with a stern and energetic cast of countenance. Sober and continent, a despiser of luxury and wealth, his zealous support of the Catholic party was entirely founded upon fanatical zeal for the supremacy of a religion which he regarded with more than monkish devotion.

TIL-SEED. See SESAMUM.

TI'LSIT, a town of Prussia, in the province of Prussia, on the left bank of the Memel or Niemen, 65 miles N.E. of Königsberg. Pop. (1880) 21,400. It stands in a fruitful district, called the Tilsit Flat, has broad streets, and a cleanly appearance. Its castle and town-hall are the chief buildings. It carries on an active transit-trade with Russia, besides considerable trade in timber, corn, butter, cheese, and Russian products, and has paper, sugar, and oil-mills.

T. will be ever memorable in history for the treaties which were there signed between France and Russia on 7th July, and France and Prussia on 9th July, 1807. By the former of these, Napoleon agreed to restore to the king of Prussia a great portion of his dominions, his Polish acquisitions being joined to Saxony (see POLAND), and his possessions west of the Elbe formed into the nucleus of the new kingdom of Westphalia; Danzig was declared an independent city; the Prussian province of Bialystok was ceded to Russia; the dukes of Oldenburg and Mecklenburg, the czar's relatives, were reinstated by Napoleon, and in return, the Bonapartist kings of Naples and Holland were recognized by the czar; &c. By the latter, the king of Prussia recognized the kings of Holland, Naples, and Westphalia, and the Confederation of the Rhine, agreed to the cessions laid down in the Russian treaty, and to other minor alienations and concessions to Saxony, amounting in all to nearly one half of his dominions; to the exclusion from his harbors of the commerce of Great Britain, and to the occupation of the Prussian fortresses by the French, till the payment of an enormous ransom. The weighty importance of the alterations effected by this treaty is, however, dwarfed before the startling magnitude of the *secret provisions* signed between France and Russia. By these were arranged the resignation of the empire of the East to Russia, Roumelia and Constantinople being specially excepted by Napoleon, and the acquisition of the Spanish peninsula by France; the two powers were to make common cause against Great Britain, and were to force the three courts of Stockholm, Copenhagen, and Lisbon to join them; and Napoleon agreed to increase no further the power of the duchy of Warsaw, and to do nothing which might lead to the re-establishment of the Polish monarchy. By a further agreement, not put formally into writing, the mouths of the Cattaro, the Ionian Isles, Sicily, Malta, Egypt, and the papal dominions were to be taken by France; and Greece, Macedonia, Dalmata, and the Adriatic coasts, on the partition of Turkey; while on the other hand, Russia was to obtain the rest of Turkey, and was allowed to seize Finland. These secret articles are given on most excellent authority, and their correctness is further vouched for by the conduct of France and Russia for the next few years.

TIMBER, a general term appplied to all wood used for purposes of construction. Most of these have been described under their respective names; but the following tabular statement will show the value of some of the leading sorts of colonial timber which are now beginning to be imported into Britain:

Name.	Colony whence imported.	Breaking Strain of Specimens two in. sq. by twelve in. long.	Specific Gravity.
		lbs.	
Iron-wood,	Jamaica	14,991·2	
Greenheart,	B. Guiana	12,215 6	1·089
Hickory,	N. S. Wales	7,795·4	
Mora,	B. Guiana	9,700·2	0·922
Water-gum,	N. S. Wales	7,760·1	
Blue-gum,	N. S. Wales	7,167·1	0·843
Bully Tree,	Jamaica	6,724·0	
Purple-heart,	B. Guiana	6,393·3	
Locust Tree,	B. Guiana	6,062·7	
Stringy-bark,	N. S. Wales	5,795·9	
Cedar,	Jamaica	3,196·7	
Yacca,	Jamaica	2,204 6	

The trade in timber is, of course, very extensive. Besides that grown in Great Britain, there is annually imported from the colonies and foreign countries an enormous quantity. Of fir, the imports in 1865 were 4,014,655 loads, of which rather more than one half was from the North American colonies, and the remainder from foreign countries. In 1877 the total quantity of all kinds of timber imported was 6,788,779 loads, the load being 50 cubic feet. There were besides 90,720 tons of mahogany and other hard wood, and the total value of the whole amounted to the sum of £20,628,424.

TIMBER, in point of English Law, when growing on land, belongs to the owner of the land; or in case of a lease, to the landlord. In the case of a life-estate in the lands, the tenant for life, unless restrained by covenant or agreement, is entitled to estovers or botes; i. e., wood necessary to repair or burn in the house, and to repair hedges and fences. But the tenant for life cannot commit voluntary waste by felling trees. If the timber is in such an advanced state that it would be injured by standing longer, the Court of Chancery has power to grant leave to sell it, in which event the principal of the price will belong to the reversioner, and the interest thereof to the tenant for life. If, however, the estate for life is declared to be given without Impeachment of Waste (q. v.), as is often the case, then the tenant for life may cut timber to a certain extent with impunity. The tenant for life is entitled to all timber that is blown down on the estate. With regard to ordinary tenants or lessees of lands, though the timber is part of the inheritance, and belongs to the landlord, yet the tenant may cut down the underwood, and take sufficient estovers, or wood, to do repairs. Timber is also protected against third parties who steal or injure it. Thus, whoever steals, cuts, breaks, or damages trees with intent to steal them, provided the injury exceed one shilling in value, incurs a penalty of £5; and on repeating the offence, imprisonment may be added: so whoever unlawfully and maliciously cuts, breaks, barks, or otherwise destroys trees to the value of one shilling and upwards, forfeits £5, or may be imprisoned, in addition to, or as a substitute for such payment, with increased punishment for repeated offences of the same description.

TIMBERS of a ship are the upright ribs, based on the keel, and rising to the gunwale, on which the planking is fastened. See SHIP-BUILDING.

TIMBER TREES. Trees valuable for their timber are very numerous, and are found in all the warm and temperate parts of the world, except where the aridity of the soil, or the sea-breeze, prevents their growth. They belong to very many and widely different natural orders, all of which, however, are orders of Phanerogamous plants; the only Cryptogamous plants which assume the form of trees being the Tree Ferns (q. v.), none of which

yield valuable timber. Of Endogenous plants, none have any claim to be mentioned among timber trees, except some of the Palms (q. v.); the only other endogens, indeed, which can be called trees being a very few of the *Liliaceæ*, as the Dragon Tree. See DRAGON'S BLOOD. Of Gymnogens, the *Coniferæ* are in general of some value for their timber, and some of them are amongst the most useful of all timber trees, as the different kinds of Fir and Pine. A far greater number of timber trees, however, are true exogens, as the Oak, Ash, Elm, Beech, Sycamore, &c., among British trees; the Chestnut and Walnut among those of the south of Europe; the Mahogany, Teak, &c., among those of tropical countries. It is impossible, within our space, to attempt an enumeration. Notice is taken of the most valuable timber trees of different countries in the articles on these countries; of those belonging to particular natural orders, in the articles on these orders; and the most valuable kinds are noticed in separate articles. For the cultivation of timber trees, see the article ARBORICULTURE. Some trees, of comparatively small size, are valuable on account of the quality of their timber, which is used for veneering, or for turnery. Some trees, chiefly valuable as fruit trees, may also be reckoned amongst timber trees, although not of great importance, of which the apple tree may be mentioned as an instance.

TI'MBREL (Spanish *tamburil*), a small musical instrument, of the drum species, in use in ancient times, which was carried in the hand, and was apparently not unlike the modern Tambourine (q. v.), with or without bells.

TIMBU'KTU, a famous city of Sudan, occupies a position of the highest commercial importance on the great north-western bend of the Niger; lat. 17° 37′ N., long. 3° 5′ W. It stands only a few feet above the level of the Niger, and at a distance of about six miles from the principal branch of that river, is triangular in shape, is from 2½ to 3 miles in circumference, and at present without walls, though in former times it covered a much greater area, and was defended by walls. It is laid out mostly in straight, but partly in winding streets of hard sand and gravel, and having a sort of gutter in the middle. There are three chief squares. There are about 980 clay houses—some low and unseemly, and others rising to two stories, and exhibiting considerable architectural adornment—and about 200 huts of matting, almost all in good repair. In the north of the city is the mosque of Sánkoré, an edifice of great grandeur, and which imparts an imposing character to the whole district in which it stands; and the other chief buildings are the 'Great Mosque,' an immense edifice of stately appearance 286 feet in length by 212 feet in width; and a few other mosques. The climate is not considered very healthy. T. is not a manufacturing town, almost the whole life of the city being based upon foreign commerce, for which its situation renders it the most favored center. The quantity of corn raised here is much too small to supply local consumption, and almost all the victuals used are imported by water-carriage from Sansanding, on the Upper Niger. The only manufactures carried on are blacksmiths' work, and articles in leather, especially luggage-bags, cushions, tobacco-pouches, and gun-covers. Most of the clothing sold here is imported from Kano, Sansanding, and England. There are three great highways for foreign commerce to the city of T.—down the river from the southwest, and by two roads from the north, from Morocco and Ghadames respectively. Of this commerce, gold, which arrives at this place chiefly in the form of rings, is the staple; and the amount which the city exports is set down at about £20,000 yearly. Salt, and the kola-nut, which is used in place of coffee (see TEA), are also largely imported and re-exported, as are also tobacco and dates. Rice and corn are brought from Sansanding; English manufactures, consisting of red cloth, sashes, looking-glasses, cutlery, and calico, arrive from the north and north-west. The regular pop. of T. is 13,000; with floating pop., during the months of the greatest traffic, from 18,000 to 23,000. T. was founded about the end of the 11th c., and first became known to Europeans in 1373. It has been visited by but five or six Europeans, including Lenz in 1880.

TIME, in Music, is used in three different senses: 1. The relative duration of musical sounds as measured by the rythmical proportion of the different notes, a minim being half of a semibreve; a crotchet, half of a minim; a quaver, half of a crotchet, &c. 2. The division into measures or bars, and the division of each measure into equal parts, and sub-division of these parts; the different combinations of sounds into equal measures and values being said to form different kinds of time, each indicated by a distinct rhythmical signature. 3. The degree of movement—that is, the absolute, and not relative velocity, which is now more generally expressed by the Italian word *tempo*.—For time in the first two senses, see RHYTHM; in the third sense, TEMPO.

TIMES, THE, is the largest and most important daily newspaper in England and in the world. It was founded towards the end of the last century by Mr. John Walter, a London printer. In January 1785, he established *The Daily Universal Register*, which he continued to publish until January 1788, when he changed the name to *The Times, or Daily Universal Register*, afterwards shortened to *The Times*. The publication, until the close of the century, remained undistinguished by any extraordinary merit or success. But in 1803, a son of Mr. Walter, also named John, became joint-proprietor and sole manager; and under his guidance it soon became remarkable for the accuracy and freshness of its news, and the independence with which it expressed opinions on social and political questions. Reporters and correspondents were engaged with great discrimination, and their best services were secured by prompt and liberal remuneration. The younger Mr. Walter acted himself as manager and editor. In 1805, the *Times* made an attack on Lord Melville's administration at the Admiralty, and the Walter family were in consequence deprived of the lucrative post of printers to the Board of Customs, which they had held for 18 years. At that time, there was, in consequence of the war, a great demand for continental news. The letters of the *Times'* correspondents abroad were transmitted through the regular channels, but the packets were stopped by the government, and Mr. Walter was informed that he would be supplied as a favor, like the other newspapers, with official information. He declined to avail himself of this offer, and it was then he took means to secure the special and early transmission of news for his paper. His success was remarkable; and on many occasions the public dispatches were anticipated.

Thus, the *Times* announced the capitulation of Flushing two days, and the result of the battle of Waterloo some hours, before the arrival of the regular dispatches. An increased circulation was the reward of these efforts, and the only limit to the increase of circulation was the impossibility of throwing off a sufficient number of copies of the paper by the hand-printing press. Mr. Walter saw the importance of introducing steam-printing, and so early as 1804, he encouraged an ingenious compositor, named Martyn, to complete a machine he had invented; but Mr. Walter the elder, who was then alive, was less sanguine, and the scheme fell to the ground. Some years later, Frederick Koenig, a German, invented and patented a new press, which could be worked by the steam-engine, and Mr. Walter became his patron. He gave him, in 1814, an order for two machines, which, in anticipation of opposition on the part of the pressmen, were put up in premises adjoining the office. On November 29, in the same year, it was announced to these men that the paper had been printed by steam, and that there was no further occasion for their services. It is very creditable to the proprietors of the *Times* that no advantage was taken of the violent language used by the workmen on this occasion, and that their wages continued to be paid while they remained without employment. Under the old mode of going to press, about 250 copies could be printed per hour; but with the new machine it was possible to take 1100 impressions in the same time, so that the *Times* had a means of increasing its circulation not at the command of the other newspapers. From this time, Mr. Walter intrusted the superintendence of the literary department of the paper to Mr. Thomas Barnes, the first editor, born in 1785, who remained in the same situation until his death in May 1841. Mr. Barnes wrote few articles, but he fixed on the subjects to be discussed, and displayed great ability in giving uniformity of tone and point to the articles passing through his hands. It was during his editorship that a series of leaders by Mr. Edward Sterling obtained for the paper new political and social influence, recognized by the name then applied to it, of 'the Thunderer.' It was in his time, too (1834), that O'Connell attacked the accuracy of the *Times'* reports of the parliamentary debates, and was signally defeated by the testimony of those whose speeches were said to have been tampered with.

In 1841, Mr. John T. Delane succeeded Mr. Barnes as editor of the *Times*, and continued to conduct the paper with distinguished ability till his retirement in 1877. It was also in 1841 that newspaper won a new title to the confidence of the mercantile community, by the detection of a great scheme to defraud the leading banking-houses. If Mr. O'Reilly, the Paris correspondent, had not discovered the conspiracy, which was headed by a French baron, and other persons holding a good position in society, it was shown that the leading banking-houses would have been defrauded to the extent of a million sterling. The *Times* did not altogether escape punishment. It had to defend an action at law, in which, although a verdict for a farthing of damages only was given, the defendants were obliged to pay their own costs. To relieve them of this burden, £2700 were in a very short time subscribed by the bankers and merchants chiefly of the city of London. The offer of this sum was declined, and it was in consequence employed in another way, to commemorate the event which had led to its being collected. Two sums of £1000 each were devoted to found *Times'* scholarships at Oxford and Cambridge in connection with Christ's Hospital and the City of London School; and the balance was employed to erect marble tablets at the *Times'* office and the Royal Exchange, recording the obligations the mercantile community were under to the proprietors for the generous manner in which their interests had been protected. After the death

of Mr. Barnes, Mr. Walter did not relax his efforts to obtain early intelligence. In 1842, a remarkable instance of the trouble and expense he incurred with this view, was brought under public notice. The news of the massacre in the Cabul Pass was first made known in the *Times*. The correspondent's letter containing it had been forwarded from Marseille to Paris by carriages specially hired; from Paris to Boulogne by horse; thence to Dover by the steamer belonging to the newspaper (which had been for days in the Channel with steam up); and from Dover to London again by horse. The letter reached the *Times*' office at 2 o'clock on Sunday afternoon, and was immediately put in the hands of compositors, who had been kept in attendance from the preceding day, in expectation of its arrival.

The only news of the event which had reached England at the meeting of the House of Commons next day was that contained in the *Times*, and it was at once assumed by the government as having all the authenticity of a dispatch received by the ordinary channels. The cost of conveying this letter from Marseille to London was upwards of £300. Noteworthy events in the recent history of the *Times* have been the publication of the letters by Dr. W. H. Russell and other special correspondents at the seat of successive European wars; the establishment of the *Times*' fund for the relief of the soldiers in the Crimea (£15,000 of which was collected in a fortnight); the formation of a fund, in 1858, for the relief of the homeless poor. Important mechanical improvements have recently been introduced in the printing office: the 'Walter' Press in 1871, and the composing-machine in 1872. A new office was built in 1873. The annual summaries from the *Times* for 1851—1875, and its obituary notices of *Eminent Persons* (1870—1879), have recently appeared as volumes. In 1877, a weekly edition of the *Times* began to be issued. In 1880, the *Quarterly Review* stated the circulation of the *Times* at 100,000. The prosperity of the paper may be fairly attributed to the great fulness and accuracy of the parliamentary intelligence; the literary merit of the leading articles; the value of the special telegrams and letters; the care and good taste displayed in the revision of contributions; the respect with which honest opinion is treated; and above all, perhaps to the absence of that sarcastic or abusive tone towards classes and sects, and that harsh literary criticism, by which other publications have obtained popularity.—See Hunt's *Fourth Estate;* Andrews' *History of Journalism;* Grant's *Newspaper Press;* Hatton's *Journalistic London* (1882).

TIME-TABLES. See BRADSHAW'S RAIL. GUIDE.

TIMO'LEON, a great Greek general, and the liberator of Sicily from the dominion of 'tyrants,' belonged to one of the noblest families of Corinth, and was born there about 394 B.C. T.'s brother, Timophanes, having made himself tyrant of his native city, T. either killed him with his own hand, or caused him to be killed. Opinion was divided in Corinth as to the merit of this deed, one party extolling it as an act of the noblest patriotism, while the other demanded T.'s death as a murderer. The difficulty was got over by appointing him leader of a small band of mercenaries sent (344 B.C.) to Syracuse, the exiled citizens of which had begged assistance from Corinth, the mother-city, against the 'tyrant' Dionysius and the Carthaginians. Outwitting the Carthaginians, T. arrived safely at Tauromenium, where he was welcomed by the Syracusan exiles. Hicetas, 'tyrant' of Leontini, was then striving to dispossess Dionysius, and secure the tyranny of Syracuse for himself, and had succeeded in getting possession of the whole city except the island citadel. T., with only a fifth of the number, defeated him at Adranum; and marching to Syracuse, made himself master of two quarters of the city. From this time onwards, T.'s career in Sicily was one of complete victory over all opponents. Dionysius the Younger (q. v.) in 343 B.C., surrendered in despair the citadel of Syracuse, and was sent to Corinth. Hicetas having failed in the attempt to assassinate T., called in the assistance of a Carthaginian force of 50,000 men, which, however, was shortly after withdrawn by Mago, who had become suspicious of treachery. Hicetas at last fled to Leontini, leaving T. sole master of Syracuse. After repeopling the almost desolate city by recalling exiles, and inviting new colonists from Greece, Italy, and Sicily, he spent the next two years in enacting laws and organizing a constitution, which he put on a completely democratic footing.

The Carthaginians, alarmed at the reviving power of Syracuse, and the prospect of union among the Sicilian Greeks, now sent an army of 80,000, under Hasdrubal and Hamilcar, to subdue the whole island. T., with only 12,000, encountered them (339 B.C.) on the Crimissus, and gained one of the greatest victories ever won by Greeks over barbarians. He now proceeded with his great project of expelling the tyrants of the other Greek cities, who, however, again called in the aid of the Carthaginians; but the successes of T. soon made the Carthaginians glad to conclude a treaty, fixing the river Halycus as the boundary between their dominions and those of the Greeks. Hicetas, 'tyrant' of Leontini, being now captured, was put to death with his wife and daughters; and shortly after, Mamercus of Catana suffered the same fate. T. thus in about six years freed Sicily from nearly all its tyrants, and conferred upon the cities free constitutions, himself all the time taking no advantage of the immense influence which he thus obtained. After his great work was accomplished, he lived among the Syracusans as a private citizen, receiving from them and from all the Greek world the greatest honor and respect: his advice was had recourse to by all the Sicilian cities in any emergency. He died in 337 or 335 B.C., having been blind for a considerable time previously; and was buried in the market-place of Syracuse, where a gymnasium, called the Timoleonteum, was afterwards erected over his tomb. T. was undoubtedly one of the greatest generals and noblest characters produced by Greece; he appears to have been thoroughly unselfish, and to have set before him as his great aim the abolition of tyranny, and the establishment of freedom.

TIMON THE MISANTHROPE was a native of Athens, and lived in the time of the Peloponnesian War (431—404 B.C.). The little that is known concerning him is learned chiefly from Aristophanes and the other comic writers who attacked him. Disgusted with mankind, on account of the ingratitude of his early friends and companions, he lived a life of almost total seclusion from society, his only visitor being the 'bold and insolent' Alcibiades. Numerous stories were current in antiquity regarding his eccentricities, one of which is, that he died because he would not allow a surgeon to visit him to set a limb. His grave, which was on the sea-shore, is said to have been planted with thorns, and to have been rendered inaccessible by the sea forming it into a small island.

> We know him out of Shakspeare's art,
> And those fine curses which he spoke—
> The Old Timon with his noble heart,
> That strongly loathing, greatly broke.
>
> TENNYSON.

'The Timon of Plutarch and of the popular stories of Shakspeare's time was little different from the ordinary cynic. The Timon of Shakspeare is essentially high-minded and generous, his all-absorbing defect—the root of those generous vices which wear the garb of virtue—being the entire want of discrimination. If Timon had possessed one friend with whom he could have exchanged confidence upon equal terms, he would have been saved from his fall, and certainly from his misanthropy.'—See Introductory Remarks to *Timon*, in Knight's Shakspeare.

This T. must be distinguished from the Greek poet and philosopher of the same name, who lived about a century and a half later.

TIMO'R, the most important of the chain of islands which stretch eastward from Java, lies in 8° 16′—10° 25′ S. lat., and 125° 25′—127° 10′ E. long., has an area of 8820 sq. m., and pop. of about 400,000. A chain of wood-clad mountains runs throughout its entire length; Alas, on the southeast, being 11,800 feet in height; Lakaan, in 9° 10′ S. lat., 6175 feet; and Miomaffo, 4630. The prevailing rocks are of the graywacke formation, which, at the south base of Miomaffo, is cut by serpentine mountains of limestone; and calcareous rocks resembling ruins frequently occur. Magnetic iron, porphyry, syenite, gold, copper, malachite (containing 22 per cent. of pure copper), sulphur, and naphtha, are found.

The dry monsoon is from May to November, during which no rain falls. From November to April, there are daily storms of rain and wind from the north-west; the streams are swollen; the thermometer rises to 94° F. in the shade; the earth is covered with a dark-green carpet, and myriads of insects come into life. The rivers are numerous, but small, and most of them yield gold. Near the sea, are very fertile lands, on which are grown rice, maize, beans, tobacco, sugar-cane, cotton, potatoes, and all sorts of tropical fruits. There are many varieties of the palm, the lontar being useful for food and other purposes. Timber trees suited for masts attain a height of 100 feet, and from 3 to 4 in diameter; the wild nutmeg, cinnamon, and tamarind are plentiful; and bamboos make the forests impenetrable in many parts. About 600 species of plants are known, a great number being medicinal, and few poisonous. Indigo grows everywhere, and potatoes in the mountains.

Three-fourths of T. on the south-west is subject to the Dutch, whose chief settlement is Koepang (Kūpang); the remaining part in the north-east belongs to the Portuguese, who have a town called Dilly, on the north coast, with a safe roadstead, and a fort, which was nearly destroyed by an earthquake in 1857. T. is divided into small kingdoms, ruled by rajahs under Dutch or Portuguese control.

Koepang lies at the base of a semicircle of wooded hills, on a beautiful bay in the south-west. It is irregularly built, the principal buildings being the governor's house and the Protestant church. There is a Mohammedan and a Chinese temple, one Dutch, and two Malay schools. Pop. 3500, including 100 Europeans and 500 Chinese. Whalers and trading-ships from Sidney,

Van Diemen's Land, &c., call for provisions on their way to or from Java and Singapore; and T. will be a convenient market for horses and supplies to the settlements in North Australia, which is only eight days' sailing distant.

The exports are—sandal-wood, horses, wax, tortoise-shell, edible nests, &c.; imports—cotton, woollen, and silk fabrics, provisions, and general supplies. Pearls are found on a bank 30 miles south-east from Koepang. The natives are partly Oceanian negroes, and partly of Malay race. They worship a supreme being called 'Lord of the Sun.' Near the Netherlands' settlements, some hundreds have been baptized, but missionary efforts have not been very successful. The fathers dispose of their daughters for gold and buffaloes, and polygamy prevails among the rich.

Koepang is the capital of the Netherlands' residency or government of T., which includes Samao, Rotti, Savu, the Sandal-wood Island, Sumbawa, Flores, Adanara, Solor, Lomblem, Ombay, and all the small islands belonging to the chain.

TIMO'R-LAUT, THE, or TENIMBER ISLANDS, lie east from Timor, in 6° 40′—8° 23′ S. lat., and 130° 26′—132° 2′ E. long., having an area of 3150 sq. m. Pop. 15,000. By far the largest island of the group is Timor-Laut, which is 78 miles in length, and 21 in breadth. The soil is rich, and covered with the most luxuriant vegetation, various palms and other useful trees growing in great abundance. At a little distance from the shore, mountains encircle the island.

The next in importance is Larat, the north-west point of which is in 7° 6′ S. lat., and 131° 47′ E. long. Area, 147 sq. m.; pop. 2500. It is also mountainous. Further north are Vorhate, Marū, and Molo. On the west of Timor-Laut are Selū and Sejrah; a multitude of smaller islands of coral formation being scattered around.

On the larger islands are small horned cattle, goats, swine, fowls, and a great variety of birds. Nothing can exceed the beauty of the Blue-streaked Lory (*Eos reticulata*) and the Citron-crested Cockatoo (*Cacatua citrino-cristatus*). Fish are plentiful in the rivers of T. and surrounding seas, and there is a considerable export trade in tortoise-shell and Bêche-de-Mer (q. v.). English trading-ships from Singapore, and South-sea whalers, sometimes visit these islands, and not unfrequently have been treacherously attacked. The natives are tall, well-made, fairer-complexioned, and have more regular features than the Alfoors. They are low in the scale of civilization.

TIMOTHY, FIRST AND SECOND EPISTLES TO, form, along with the Epistle to Titus (q. v.), the three 'Pastoral Epistles,' the authorship of which is all but universally ascribed to St. Paul. The external evidence for their genuineness is very strong, yet not complete. They occur in the Muratorian Canon and the Peshito version as writings of St. Paul; Eusebius classes them among the *homologoumena;* while still earlier, Irenæus, Tertullian, and others of the Fathers quote them as authoritative. On the other hand, Tatian (q. v.), one of the earliest of the Fathers, denies their genuineness, as did also Marcion, Basilides, and most of the Gnostic teachers. Origen speaks of some who rejected 2d T. on account of the mention of 'Jannes and Jambres,' two apocryphal characters; while in modern times, Schleiermacher and Neander admit the Pauline origin of 2d T., and endeavor to disprove the genuineness of 1st. Eichhorn, De Wette, Baur, and others go further, and seek to demonstrate the spuriousness of the whole three Pastoral Epistles. They consider the language and mode of thought quite distinct from the Pauline, and they (particularly Eichhorn) find no period in the apostle's life to which they could be properly fitted in. Their arguments have largely influenced the conclusions of very many scholars in this field. The purpose and scope of the Epistles to T. are so well known, that an analysis, however slight, is almost superfluous. They consist of a series of warnings, exhortations, advices, and predictions.—See the 'Introductions' of Alford, Wordsworth, Davidson, Wiesinger, Hug; and the list of commentators on the 'Pastoral Epistles,' appended to the article on the Epistle to TITUS.

TIMOTHY GRASS, the name commonly given to *Phleum pratense*, a grass much valued for feeding cattle. It first received the name T. G. in America, from the name of a person who did much to promote its cultivation there. Along with the other species of the genus, it often receives also the English name of CAT'S-TAIL GRASS. The genus *Phleum* is distinguished by a panicle so compact as to resemble a close spike, single-flowered spikelets, with two nearly equal accuminate or almost awned glumes, two awnless paleæ, and the seed free. The species are mostly natives of Europe; a number of them are British, but the T. G. alone is of any economical value. It varies very much in size according to soil and situation, succeeding best in moist rich soils. It is very extensively cultivated both in Britain and in America. It has strong culms, attaining a height of 4—5 feet, but is tender and nutritious, and much relished by cattle. It is perennial, but springs up rapidly, even in the year in which it is sown. Its spikelike panicle, from the form of which the name Cat's Tail has been given, is cylindrical, and often of several inches in length. The seed is very small.—*Phleum nodosum* is a very similar species, perhaps a mere variety, with the lower part of the culm prostrate and swollen into knots or bulbs; the spike much smaller than in *P. pratense*. It is a very inferior grass, and is found only on dry soils.

TIMUR, called also TIMUR-BEG and TIMUR-LENG from his lameness, and vulgarly known among western writers as TAMERLANE, was the second of the great conquerors whom Central Asia sent forth in the middle ages, and was born at Sebz, 40 miles from Samarkand, April 8, 1336. His biographers make him the fifth in descent from Karatchâr Nuyan, the relative and counselor of Genghis Khan (q. v.), and the ninth from Tûmna Khan, the direct ancestor in the male line of his renowned predecessor. The royal line of Jagatai (see TURKESTAN) had so utterly degenerated that the real power was in the hands of a number of independent chiefs of Mongol blood, each of whom, choosing a prominent city of the kingdom, there set up his standard, and lorded it over the surrounding district. One of these chiefs, Hadji Berlas, the uncle of T., had established himself at Kesh, and here the future conqueror passed the first 24 years of his life in peaceful obscurity, devoting himself to the national amusements of hunting and equestrianism. But a formidable inroad (1360) of the Kalmucks of Jettah, who speedily subjugated Turkestan, expelling those chiefs who refused submission, effectually called forth T.'s hitherto untried energies. Declining to accompany his uncle in his flight, he boldly advanced with a small retinue to meet the invader, who was so charmed with his eloquence and address, that he at once confirmed him in the government of Kesh, and appointed him one of the principal ministers of his son, the new monarch of Turkestan. But neither chiefs nor people of the conquered country could long endure the tyranny of a race more cruel and barbarous than themselves, and the exiles and fugitives having been collected by the Ameir Husseyne, and joined by a powerful force under T., the Kalmucks were ultimately expelled in 1365, and Turkestan divided between its two liberators, who ruled together in the utmost harmony for some time; but war having arisen beween them, Husseyne was defeated and slain, and T., by unanimous consent of the chiefs, was hailed as supreme lord of Turkestan.

It was in the war against the Kalmucks that T. received the wound in the thigh which rendered him lame for the rest of his life. He did not, however, either then or afterwards, assume the rank of a sovereign, but elevating one of the royal race to the throne, reserved for himself the real authority and the title of *emir*. Having thus, in the space of ten years, risen, by dint of superior ability, to absolute authority over a numerous and warlike people, he proceeded to avenge his nation's wrongs on the Kalmucks of Jettah and Mogulistan; then turned westward to punish the predatory tribes of Khaurezm, who had plundered Bokhara; and spent the interval between these campaigns in supporting Toktemesh Khan, one of the claimants to the throne of Keptchak, ultimately (1376) placing him in undisputed possession. With the view of restoring its former limits to the empire of Jagatai, he summoned the prince of Herat and the other chiefs of Northern Khorassan to attend a 'kouriltai;' and on their refusal, immediately attacked and reduced them to submission, levying a moderate contribution as a penalty. But soon after (1383), the people of Herat again rebelled, murdered the envoys whom he sent to remonstrate; and 2000 of the garrison, built up with an alternate layer of brick and mortar into the form of a pyramid, were left by T. as a horribly singular and effective reminder of the consequences of rebellion. Seistan was next reduced, the Afghans of Suliman Koh chastised, and T. returned, as was his wont, to spend the winter in the bosom of his family, at one or other of his numerous palaces near Samarkand. In the following year, he commenced his career of aggression by the invasion of Mazanderan; and by the close of 1387, the whole of the districts west of the Tigris, from Tiflis to Shiraz, were subdued; those chiefs who voluntarily submitted being mostly confirmed in their governments, while the inhabitants of Ispahan—who, after a pretended submission, suddenly rose upon the Tartar garrison, and massacred 3000 of them—were almost completely exterminated. Meanwhile, Toktemesh Khan, of Keptchak, took advantage of his absence to invade T.'s territories on the Amu-Daria; on which T. returned home, and, after driving the invaders out, pursued them to the head of the Tobol, then west across the Ural mountains and river, and though long baffled by the Arab tactics of his opponents, finally brought them to bay on the banks of the Bielaya (a tributary of the Kama), 18th June 1391, and almost wholly annihilated them.

Resuming, in 1392, his conquering march westwards, he crossed the Tigris, subdued the numerous and warlike principalities to the east of the Euphrates, then advanced northwards, through the gates of Derbend, to the Volga, and again routed Toktemesh (who had ventured to resume hostilities), on the banks of the Terek (1395), turned west as far as the Dneiper, and then north to Mos-

cow, returning by Astrakhan and the Caucasus, leaving death and desolation in his track. In 1398, T. campaigned in Hindustan, entering by the passes of the Hindu Koh, near Cabul, and routing *seriatim* the numerous armies collected to oppose him, till the number of prisoners became so great, that four days before the great battle before Delhi between T. and the Indian emperor, the former, as a precautionary measure, ordered the murder in cold blood of all the males (said to be 100,000 in number), and then, after totally routing his opponents, took the capital. After a further advance to the Ganges, and more military successes, T. retraced his steps to Samarkand, where the immense spoils of the expedition were expended in the adornment of the capital. T. returned to Western Asia in the following year, and attacked the Egyptian Empire in Syria, to avenge the murder of his ambassador, and the aid which the Mamluk sultan had given to his enemies. T. was as usual completely successful in the field; and the capture of Aleppo, Hama, Hems, Baalbek, and Damascus, equally proved his skill in the attack of fortified places. His mode of attack was to undermine the fortifications on all sides, then to fire the mines with wood steeped in naptha, and on the destruction of the walls and battlements, which uniformly resulted, to charge in overwhelming force through the breaches. Similar conduct to that of the Mamluk sultan on the part of Sultan Bajazet I., drew from T. repeated remonstrances, which the other, in the overweening confidence springing from uninterrupted success, treated with contempt, and answered with insult; but the advance of the Tartars to his frontiers soon opened his eyes to the greatness of his error, and with a powerful army, he hastened to oppose them. The two hosts met at Angora (July 20, 1402), and after a long and obstinate contest, in which, although the generalship of Bajazet and the steadiness of 20,000 Servian auxiliaries long balanced the superiority of T.'s troops, the Turks were totally routed, and Bajazet captured.

The conquest of the whole of Asia Minor speedily followed; the Byzantine emperor did submission to the victor, as did also the Turkish ruler of Thrace; and the Knights of St. John were expelled from Smyrna. The unfortunate Bajazet died after a few months' captivity, though uniformly treated with the greatest consideration; and about the same time, T. commenced his return —receiving on the way a most satisfactory embassy from the Egyptian sultan, who was now glad to come to terms—conquering Georgia, where he passed the winter, and resuming his march in the following year by Merv and Balkh, reached Samarkand in 1404. Here he resumed preparations for the long projected invasion of China, continued the embellishment of the capital, and celebrated his great successes by the most gorgeous festivities. All things being now ready, he started with a large army for the Sihun, marched down that river to Otrar, where, being detained by the severity of the weather, he was attacked by an ague-fever, and died after a week's illness, February 17, 1405. T. holds a high position as a mere conqueror: his antagonists were mostly warlike and disciplined, and seldom much inferior in number; yet, from the savage horsemen of the Siberian steppes to the mail-clad warriors of Servia, all were alike forced to bow before the invincible prowess of the Mongol conqueror. The charge of cruelty brought against him is completely established by the massacre in India, but opposite to this might be placed numerous instances of a lenity and forgiveness almost incredible in a 'barbarian.' He did much to promote the arts and sciences throughout his dominions, but the speedy dissolution of his empire deprived his labors of any permanent utility.—The principal authority for the life of T. is Sherif-ed-Din-Ali's *History* (in Persian), translated into French by Pétis de la Croix, under the title of *Histoire de Timur-Bec, connu sur le nom du grand Tamerlan* (4 vols., Par. 1722). Several writings exist in Persian, attributed to T., but are of doubtful authenticity. Among these are the *Institutions* (with an English translation and a valuable index, Oxford, 1783); and the *Commentaries* of T., translated from a MS. of Major Davy by Major Stewart, late Professor of Oriental Languages in the East India Company's College. See also a translation of the narrative of Clavijo, envoy of Henry III. of Castile to T., by C. R. Markham (Hakluyt Society, 1860).

TIN (symb. Sn. atomic weight 118,* spec. grav. 7·29) is a beautiful silvery-white metal, with a tinge of yellow, and a high metallic lustre. It possesses a crystallized texture, and may be obtained in well-formed crystals of the pyramidal or tetragonal system; and it is in consequence of this crystalline texture that a bar of tin, when bent, emits a creaking sound, termed the *cry* of tin (the *Zinngeschrei*, or tin-shriek of the Germans). Tin is a soft metal—being softer than gold—and is very malleable, and can be beaten out into very thin laminæ, in which form it is known as *tinfoil*. At a temperature of about 212° F. its ductility is considerable, but by no means remarkable, and it may be then easily drawn into wire, the tenacity of which is only moderate, as a wire with a diameter of 0·17 of an inch is broken by a weight of about 50 lbs. It is a tolerably good conductor both of heat and electricity, and when handled communicates a peculiar odor to the skin. It melts at a temperature of 442° F.; and at a higher temperature, if air be present, it becomes converted into the binoxide and burns with a brilliant white light. At ordinary temperatures, it is very slightly acted on by exposure to the air, or to moisture. With regard to the action of the ordinary acids on this metal, Professor Miller observes that 'nictric acid of specific gravity 1·3 acts upon it violently, and produces an insoluble hydrated binoxide, known as metastannic acid; at the same time, owing to the decomposition of water, a considerable quantity of ammonia is formed, which enters into combination with the excess of acid. Strong hydrochloric acid, when heated upon tin, dissolves it gradually, with extrication of hydrogen. Aqua regia, if not too concentrated, dissolves the metal, and converts it into bichloride. Dilute sulphuric acid is without action on the metal in the cold; but if the concentrated acid be boiled upon it, the tin becomes converted into sulphate, while sulphurous acid escapes. The hydrates of potash and soda act upon tin at high temperatures, hydrogen being evolved, whilst a soluble metastannate of the alkali is formed.'—*Inorganic Chemistry*, 2d ed., p. 588.

There are two principal oxides of tin—viz., the Protoxide (SnO) and the Binoxide (SnO_2). There is also a Sesquioxide, Sn_2O_3.

Protoxide of Tin, or stannous oxide (SnO), is obtained as a white hydrate ($2SnO, H_2O$) by precipitating a solution of the protochloride of tin with an excess of carbonate of soda. The protoxide acts as a base, forming salts which are colorless, redden litmus, and are for the most part soluble in water, from which crystalline tin is deposited on an inserted mass of zinc, constituting the so-called *Tin Tree*. None of these salts are of any special importance. *Binoxide of Tin*, or stannic oxide (SnO_2), occurs native in the anhydrous form, crystallizing in square prisms, which are sufficiently hard to scratch glass, and generally of a brown color, from the presence of peroxide of iron or of manganese. In its artificially prepared, hydrated condition, it has the character of an acid, and according to its different modes of preparation, forms two remarkable varieties, known as stannic and metastannic acids. *Metastannic Acid* is prepared by the action of strong nitric acid on tin, and occurs as a white crystalline, insoluble mass, which, when dried in air, consists of $H_{10}Sn_5O_{15}5H_2O$, but when dried at 212° F., loses five molecules of water, and consists of $H_{10}Sn_5O_{15}$. By ignition it becomes anhydrous, and of a pale straw color. In this form (in which it resembles the native binoxide in its properties), it is known in commerce as *putty-powder*, and is employed for polishing plate, and for giving whiteness and opacity to enamels. In the hydrated state, it is insoluble in hydrochloric or nitric acids, but is freely soluble in solution of potash or soda, forming salts which are not crystalline, but may be obtained in a granular form. Metastannic acid, in its hydrate state, may be recognized by the beautiful golden yellow metastannate of tin which is formed when it is moistened with protochloride of tin. *Stannic Acid* ($SnO_2,2H_2O$) is procured by the addition of carbonate of lime or of baryta to a solution of bichloride of tin, when it falls as a gelatinous precipitate. Unlike metastannic acid, it is readily soluble in nitric and hydrochloric acids; and at a temperature of 284° F. it is converted into metastannic acid. In combination with the alkalies, it forms stannates, which crystallize readily, and whose formula is MO,SnO_2. The stannate of soda (Na_2SnO_2) is largely used as a mordant by the dyer.

There are two chlorides of tin—viz., a Protochloride and a Bichloride. The *Protochloride of Tin*, or stannous chloride ($SnCl_2$), may be obtained in a hydrated form by dissolving the metal in hydrochloric acid, and evaporating the solution, when the salt crystallizes in prismatic needles, having the composition $SnCl_22H_2O$. The hydrated protochloride is extensively used as a mordant, and for deoxidizing indigo and the peroxides of iron and manganese, by the dyer and calico-printer; and in consequence of its deoxidizing or reducing powers, it is sometimes employed in analytical chemistry, especially in the determination of the quantity of mercury, since all the mercurial salts, when boiled with it, are decomposed, and yield their mercury in the metallic form. *Bichloride of Tin*, or stannic chloride ($SnCl_4$), forms numerous double salts with the soluble chlorides; the compound of this nature which it forms with chloride of ammonium is represented by the formula $2NH_4Cl.SnCl_4$, and is employed by the dyer under the technical term of *Pink Salt*. An impure bichloride, prepared by dissolving tin at a gentle heat in a mixture of nitric acid and sal-ammoniac, and known in the trade as *Nitromuriate of Tin*, or *Composition*, is also largely used by dyers and calico printers.

The sulphides of tin are three in number—viz., the protosulphide, the sesquisulphide, and the bisulphide. The *Bisulphide of Tin* (SnS_2) may be obtained in the hydrated state, in the form of a dingy yellow precipitate, by passing sulphuretted hydrogen through a solution of a persalt of tin. In the dry way, it is procured in the form known as Mosaic Gold, which is insoluble in

* The atomic weights (and corresponding 'notation') adopted in this article are those of the Unitary system (H = 1, O = 16, S = 32, C = 12), instead of the older dualistic system (O = 8, S = 16, C = 6). See art. CHEMISTRY.

any acid, though soluble in aqua regia; and is employed in the arts to give an appearance of bronze to the surface of metals.

Tin forms two sets of salts—the protosalts and the persalts, of which the protochloride and bichloride of tin may be taken as good examples. The *Protosalts* (stannous salts) yield a very characteristic reaction with sulphuretted hydrogen, a chocolate-colored precipitate of hydrated protosulphide of tin being thrown down; moreover, with a dilute solution of chloride of gold, they give either a beautiful purple precipitate, known as the *Purple of Cassius*, or a brown precipitate of reduced gold, according to the quantity of the test that is used. The *Persalts* (stannic salts) yield a dirty yellow precipitate of hydrated bisulphide of tin; while all the compounds of tin, when exposed on charcoal to the reducing flame of the blowpipe, give a white malleable globule of the metal.

Reduction and Manufacture.—Tin must have been one of the metals earliest known, as it enters into the composition of Bronze (q. v.), of which the most ancient metallic weapons and tools were made. Tin and oysters were the products for which Great Britain was earliest famous. This general statement of facts is particularly noticeable. Tin is still largely obtained in Cornwall; and from that locality the Phœnician navigators took it to Tyre and Sidon. To this day, England is by far the greatest tin-producing country, having raised in 1880 about 13,737 tons of dressed ore, or 8918 tons of the metal. Bohemia and Saxony have some tin mines, and so also have Spain and Portugal. Tin has long been obtained from Malacca, in the Malayan Peninsula, and from some of the neighboring islands. Australia, among her other mineral riches, produces tin, and the import from that country in 1876 amounted to 8392 tons.

There is but one ore of tin of any importance—viz., the binoxide, or stannic oxide (SnO_2), which in its pure state consists of tin 78, and oxygen 22. It is called Tinstone or Cassiterite. Tin ore has nothing remarkable in its appearance; it is of various colors—as gray, various shades of yellow, and red, and black. Its specific gravity—a notable feature—is 6·9; and it strikes fire with steel. In Cornwall, the tin ore occurs in mineral veins running through granite and slate rocks, or disseminated in crystals through their mass. The tinstone obtained from the veins or lodes is called *Mine-tin;* and that procured by washing alluvial deposits is called *Stream-tin*—the latter is the result of the disintegration of granite and other rocks which contained veins of tin. Washed Cornish tin ore, usually called 'black tin,' produces on an average about 67 per cent. of metallic or 'white' tin. Tin pyrites, or sulphide of tin, is found in some of the Cornish mines, but it is of little importance commercially. It may also be stated that ores containing copper are sometimes found with so large a proportion of tin that it is difficult to say whether they should be regarded as tin or copper ores.

The dressing of tin ore obtained from the mine is a difficult and delicate operation. It is so much dispersed through the gangue, that it requires to be stamped to a very fine powder by apparatus described under METALLURGY, before the metallic particles can be effectually separated. So small comparatively is the valuable portion of the ore, that at Huel Kitty Mine, St. Agnes, not more than 84 lbs. of oxide of tin is obtained from a ton of the material brought to the surface; and in some mines, the proportion of oxide to the rest of the material is not so much as 10 lbs. to the ton.

The stamped ore is copiously supplied with water passed through a grating adjoining the stamps, and conveyed into a channel where there are two pits. The purer and heavier portion falls into the first, and is called the *crop;* the remainder, called the *leavings,*

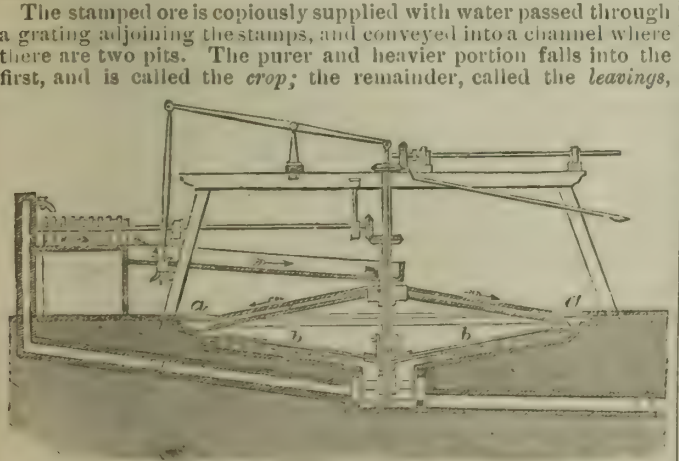


Fig. 1.

passes through the first, and is retained in the second pit. Repeated washings are now necessary to separate as thoroughly as possible the impurities from the ore, and for this purpose a machine called a *buddle* is largely employed. Various kinds of apparatus are, however, used, but they are similar in principle to the jigging sieve and sleeping table described under METALLURGY. We may notice here that a new form of buddle, known as 'Borlase's Buddle,' has been recently introduced for dressing tin ores, by which a saving of about 30 per cent. is said to be effected. Figs. 1 and 2 show this machine. The ore and earthy matters, in the state of a thick mud, are conveyed by square pipes or channels to the circumference *a*, *a*, around which, by the aid of water, the metallic portion separates, while the lighter stony impurities flow towards the center, and are carried away. There are brushes at *b*, *b*, for agitating the ore during the operation. In the older form of buddle, this action is reversed, and the machine, instead of being depressed, is raised in the center.

The tin ore thus far purified, has next to be deprived of its sulphur and arsenic; this is done in a Reverberatory Furnace (q. v.), the flues of which are connected with large condensing chambers, in which the arsenic is deposited in a crystalline form (see ARSENIC), and is afterwards resublimed, to form the white arsenic of commerce. The sulphur, which is present in the state

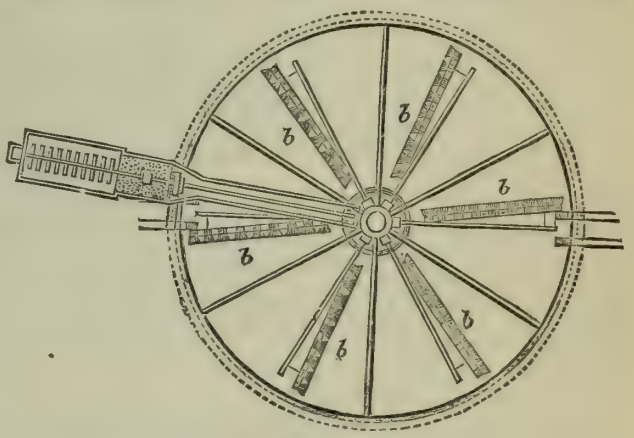

Fig. 2.

of sulphide of iron, is decomposed by the heat into sulphurous acid gas, and the remaining oxide of iron is removed by a subsequent washing. Sulphide of copper, when present, is converted by roasting, and afterwards exposing it to the air, into sulphate of copper, and is then easily dissolved out by lixiviation.

After this final washing, the ore is ready for smelting in a reverberatory furnace. The charge consists of from 20 to 25 cwts. of ore mixed with one-sixth of its weight of powdered anthracite or charcoal, and a small quantity of lime or fluor-spar, to serve as a flux for the siliceous impurities. Before being put into the furnace, the mixture is moistened with water, to prevent the finely powdered ore being carried away by the draught. When the charge is placed on the hearth of the furnace, the doors are closed, and the heat gradually raised for about six hours; the oxide is then reduced by the carbon of the coal. At this stage, the furnace-door is opened, and the mass worked with a paddle, to separate the slag, which is raked off, and the richer portion of it melted over again. The reduced tin subsides to the bottom, and is run off into a cast-iron pan, from which it is ladled into moulds, to produce blocks or ingots of a convenient size.

The tin has still to be purified, first by a process of *liquation*, and afterwards by that of *boiling*. 'Liquation' consists in moderately heating the blocks in a reverberatory furnace till the tin, owing to its comparatively easy fusibility, melts, and flows into the refining-basin, leaving on the hearth of the furnace a residuary alloy of tin with iron and other metals. More blocks are added, and heated in the same way, till the refining-basin contains about five tons. The tin is then ready for 'boiling.' In this operation, billets of green wood are plunged into the melted metal, the disengagement of gas from which produces a constant ebullition, and so causes a scum (chiefly oxide of tin) to rise to the surface, which is then easily removed; at the same time, impure and dense parts fall to the bottom. When the agitation has gone on long enough, the bath is allowed to settle and cool. The tin then separates into zones—the upper consisting of the purest portion; the middle being slightly mixed with other metals; and the lower so much so, that it requires to go through the refining process again. The residuary alloy of the liquation process has also its tin extracted and refined again.

In former times, in Cornwall, tin was smelted in a Blast Furnace (q. v.) instead of a reverberatory one; and this is still the case on the continent. By this method a pure tin is obtained, but the loss of metal in the process is greater. It suits best where coal is scarce and wood abundant.

The ores which contain the mineral wolfram (tungstate of iron and manganese) are treated by a special process, patented by Mr.

R. Oxland of Plymouth. This mineral and tin ore are so nearly the same in specific gravity, that no mechanical process of washing will separate them. Mr. Oxland's process consists in roasting the dressed tin ore with sulphate of soda, for the purpose of converting the insoluble tungstate of iron and manganese into the soluble tungstate of soda, which is easily removed by lixiviation. The oxides of iron and manganese, which are left in a finely-divided state, can then, from their lower density, be readily got rid of by washing. Since the invention of this process, some of the Cornish tin ores which used to sell at the lowest, now bring the highest price. The tungstate of soda procured in the operation has lately been found to be one of the most valuable substances for rendering cotton cloths non-inflammable.

Tin when heated up to nearly its melting-point becomes brittle, and can then be broken into prismatic fragments called *dropped* or *grain tin*. The metal which is susceptible of this change may be considered to be of fine quality, as impure tin does not become brittle when so treated. The peculiar properties of tin, especially its malleability, its brilliancy, and the slowness with which it oxidizes at common temperatures in the atmosphere, render it of great service in the arts. Utensils coated with silver require six cleanings for one that would suffice with 'tinned' vessels. Tin is consequently very largely used to coat the surface of other metals, as iron and copper, especially thin sheet-iron to form Tin-plate (q. v.). Tin-plate goods are now manufactured on a gigantic scale in Birmingham, Wolverhampton, and Dudley. The increase has been brought about mainly by the introduction of stamping machinery.

With other metals tin forms some valuable alloys. See ALLOY. An amalgam of tin and mercury forms the metallic coating of minerals. Tin-foil, $\frac{1}{1000}$th of an inch thick, is used for various purposes, and contains from 96 to 98·5 per cent. of tin, with small proportions of copper, lead, iron, and sometimes nickel. From 60 to 80 tons of tin are annually used in Birmingham in the manufacture of coffin-lace. See Flower's *History of the Tin Trade* (1880).

TINCAL. See BORAX.

TINCTURE. See HERALDRY.

TI'NCTURES are defined by Sir Robert Christison to be 'solutions of vegetable and animal drugs, and sometimes of mineral substances in spirituous liquids.' The spirit most commonly employed is proof-spirit: sometimes rectified spirit is used; and occasionally ether. Ammonia is sometimes conjoined with the spirit, in which case the solution is termed an ammoniated tincture. (It may be as well to remind the reader that *Rectified Spirit* is alcohol with 16 per cent. of water, and that its specific gravity is ·838; and that *Proof Spirit* is composed of 5 parts of rectified spirit mixed with 3 parts of water, the resulting compound containing about 47·5 per. cent. of water, and having a specific gravity of ·920.)

The choice between proof and rectified spirit depends on their respective solvent powers over the active principles of the drugs employed. The ether and ammonia are principally used for their antispasmodic properties. 'The form of tincture,' says Sir Robert Christison, 'is one of the best in pharmacy; for the menstruum is a powerful solvent of the active constituents of drugs; it presents them in small volume; it preserves them very long unaltered, and it is for the most part a convenient medium for uniting them with other substances in extempore prescriptions.'

TINDAL, DR. MATTHEW, a notable deistical writer, was the son of a clergyman at Beer-ferris, in Devonshire, where he was born about 1657. He was educated at Lincoln and Exeter Colleges, Oxford; took the degree of B.A. in 1676; and shortly after, was elected Fellow of All Souls' College. In 1685, he became a Doctor of Law; and after a brief lapse into Romanism during the reign of James II., reverted to Protestantism, or rather, as events showed, into Rationalism. His first work was entitled *An Essay concerning Obedience to the Supreme Powers*, &c. (Lond. 1693); followed in the course of a few months by *An Essay concerning the Laws of Nations and the Rights of Sovereigns;* but it was not till 1706 that he attracted any particular notice, when the publication of his treatise on *The Rights of the Christian Church asserted against the Romish and all other Priests who claim an independent power over it; with a Preface concerning the Government of the Church of England, as by Law established*, raised a storm of opposition, that may perhaps be considered to have fulfilled the prediction of the author, who told a friend that 'he was writing a book which would make the clergy mad.' A perfect torrent of replies and refutations poured from the press. Among those who signalized themselves as the adversaries of T., the least obscure were Dr. G. Hickes and Conyers Place. Swift, it may be noticed in passing, also indulged in some 'Remarks.' On the continent, T.'s work was quite differently received.

Le Clerc, in his *Bibliothèque Choisie*, praises it very highly, as one of the solidest defences of Protestantism ever written. In 1730, when he had nearly reached the age of 73, he published his most celebrated treatise, entitled *Christianity as old as the Creation, or the Gospel a Republication of the Religion of Nature* which effectually settled the question of his religious creed. The design of the work is to strip religion 'of the additions which policy, mistake, and the circumstances of the time have made to it'—in other words, to eliminate the *miraculous* element, and to prove that its morality, which is admitted to be worthy of an 'infinitely wise and good God,' is its true and only claim to the reverence of mankind. T.'s purpose was rather constructive than destructive; and it was on this account that he called himself a 'Christian Deist.' He was answered, among others, by Dr. Waterland, Mr. Foster (an eminent dissenting minister), Dr. Conybeare (afterwards Bishop of Bristol), and Dr. Leland (q. v.), with various degrees of ability and success. T.'s book is written in excellent English, and is unquestionably a very able performance, giving its author a distinguished place among the 18th c. deists. T. died 16th August 1733.

TINDER, an inflammable material, usually made of half-burned linen. It was formerly one of the chief means of procuring fire before the introduction of chemical matches. The tinder was made to catch the sparks caused by striking a piece of steel with a flint; and the ignited tinder enabled the operator to light a match dipped in sulphur. This intermediate step was necessary in consequence of the impossibility of making the tinder flame. Partially decayed wood, especially that of willows and other similar trees, also affords tinder; and certain fungi furnish the German tinder, or Amadou (q. v.).

TINEA is a term somewhat vaguely employed to designate certain parisitic diseases of the skin, and especially of the scalp. Three of the most important varieties of tinea, viz., *T. circinatus*, (ringworm of the body), *T. tonsurans* (ringworm of the scalp), and *T. sycosis* (ringworm of the beard), have been already described in the article RINGWORM (q.v.). In these three varieties, which are included in the general term *T. tondens*, the vegetable parasite known as *Trichophyton tonsurans*, figured in the above article, is always present. It now remains to notice the *Tinea decalvans* of Bateman, known also as *Porrigo decalvans, Alopecia circumscripta*, &c. It is defined by Aitken as 'a fungus disease, causing the formation of rounded or oval patches of baldness, sometimes solitary, more generally multiple. It affects the hairy scalp principally; but the beard and hairy portion of the skin may also suffer.'—*The Science and Practice of Medicine*, 2d ed., vol. i. p. 925. The fungus which causes these patches of baldness was detected by Gruby in 1843, and named the *Microsporon Audonini*. It differs from the *Trichophyton* by its numerous waved filaments, and the extremely small size of its sporules, and likewise by its position, not being found in the interior of the root of the hair, but forming a little tube round each hair, and thus causing it to soften and break down. The hairs thus affected become dull and partially loose; the skin in which they are implanted becomes red, swollen, and slightly itchy; and a whitish matter (the sporules of the fungus) may soon be observed on the diseased skin and hairs. The hairs then suddenly fall off from the affected part, leaving a round bald patch of a very white color. The disease is capable of transmission from one person to another, although less readily than *Tinea tonsurans*. It chiefly affects children. The treatment consists in preventing the spread of the disease by extracting the hairs round the circumference of the patch, and washing the head daily with soft soap; and all the young hairs within the patch must be extracted till a healthy crop begins to appear. Moreover, a solution of sulphurous acid, as recommended for ring-worm, should be applied. When by these means the fungus has been destroyed, stimulants must be applied to the bald patches. A mixture of equal parts of *Collodium* and of *Ether cantharidalis* (*Collodium vesicans*) is, according to Dr. Aitken, the most useful stimulant in these cases.

Fungus in *Tinea decalvans*: AF, lower part of an affected hair, highly magnified; FG, its root; C, sphcroidal swelling due to accumulation of spores, E, between the longitudinal fibres of the hair; D, rupture of long fibres; I, spornles and tubes of the parasite; H, a group of sporules proceeding from G, the ruptured root. (From Aitken's *Science and Practice of Medicine.*)

TINEÏ'DÆ, a family of small moths, the smallest insects of the lepidopterous order. The body is long and slender, the wings entire, often narrow, mostly convoluted in repose. Many of them are very brilliantly colored, exhibiting beautiful little stripes and patches of gold and silver. Many deposit their eggs in ani-

mal substances, on which the larvæ feed, making cases for themselves out of the substance they feed on. The Clothes Moths (q. v.) are a familiar example.

TI'NGI (*Magonia glabrata*), a tree of the natural order *Sapindaceæ*, which covers large tracts of country in some parts of Brazil, to the exclusion of almost everything else, generally growing to the height of 30 or 40 feet, but sometimes much higher. An infusion of the bark of the roots is used to poison fish. The fruit is a large dry triangular capsule, filled with broad flat seeds, from which a kind of soap is made. The membrane which covers the cotyledons is stripped off, and they are steeped in water till they begin to swell and soften, and boiled with a little tallow. A homogeneous mass is formed, which is used for washing clothes.

TI'NKAR'S ROOT (*Triosteum perfoliatum*), a shrubby plant of the natural order *Caprifoliaceæ*, a native of North America, the root of which is used as an emetic and mild cathartic. It derives its name from Dr. Tinkar, who first brought it into notice.

TINNEVE'LLY (*Tiru-nel-véli*), a chief town of the British district of the same name, is situated near the river Chindinthoora, 350 miles south-west of Madras. The town of T. is connected with the town and military station of Pallamcottah, on the opposite bank of the river. Pop. about 20,000.

TI'NNITUS AU'RIUM is the Latin translation of, and ordinary medical term for, ringing in the ears. In most cases, it is an unimportant symptom, depending on some local temporary affection of the ear, or on some disturbance of the digestive system with which the part of the brain, from which the auditory nerve springs, sympatizes, or which excites the cerebral circulation (as often occurs in the morning after too liberal evening potations); but as it is also a common symptom of organic disease of the auditory nerve, it may indicate a dangerous condition, or may be a prelude to complete deafness. Hence, although commonly of no consequence, it is a symptom that, especially if permanent, must be carefully watched. It may be readily induced for a few hours by a large dose of quinia.

TI'NOS, or TINO (anc. *Tenos*) an island in the Grecian Archipelago, belonging to the group of the Cyclades, lies immediately south-east of the island of Andros, 53 miles off the coast of Bœotia. It is 18 miles long, 8 miles in extreme breadth, has an area of 70 sq. m., and a pop. of about 13,000. The Tenians were conspicuous among the ancient Greeks for their industry, and they still maintain their pre-eminence in that respect. The island is carefully cultivated, well-watered, has a delightful climate, and is very productive in silk, wine, barley, and fruits. Silk gloves and stockings are manufactured; and the inhabitants have made themselves famous as workers in marble, which is found in the island. In the modern town of Tenos, or St. Nicholas, is a cathedral built of white marble, and famous as a resort for pilgrims.

TIN-PLATE. The manufacture of this article forms a branch of the iron trade. The art of tinning plate-iron is said to have been invented in Bohemia, about the beginning of the 16th c., although the tinning of copper was known some time earlier. Tin-plate was first made in England about the year 1670.

Sheet-iron for tin-plates is made either of charcoal-bar or coke-bar, which has been rolled with particular care, in order to avoid scales on the surface. Before tinning, the plates are called 'black plates.' When the iron has been cut to the required size, the plates are 'pickled'—that is, they are immersed in hot sulphuric or hydrochloric acid which has been diluted by 16 parts of water to 1 of acid, the use of the acid being to remove all oxide. After this, the plates require to be washed several times in water; and then follows an annealing in closed cast-iron boxes in a reverberatory furnace. The next operation consists in passing the plates two or three times through chilled iron rollers highly polished with emery and oil, so as to give them a well-polished surface. Once more they are sent to the annealing furnace, passed again through dilute sulphuric acid, which is followed by another washing, but this time in running water, and then scoured with sand. This should leave them quite clean and bright for the tinman.

Each plate is now put singly into a pot of melted grease (which has become sticky by use), and left till it is completely coated, after which the plates are taken in parcels, and plunged into a bath of melted tin covered with grease, called the 'tin-pot.' They pass from this to another vessel with two compartments called the 'wash-pot,' both of which contain melted tin of the purest quality, and like the last, covered with grease. The plates are put into the first compartment in parcels, where thay receive a coating of purer tin than that of the 'tin-pot,' and are then withdrawn one by one, and wiped on both sides with a hemp brush; the marks of which are obliterated by another dipping in the second compartment of the 'wash-pot.' This last dipping also gives the plates a polish. The next thing is the removal of the superfluous tin by immersing the plates in a pot containing tallow and palm oil, maintained at a temperature no higher than will keep the tin in contact with the oil, liquid, and so allow it to run off. The final treatment consists in working the plates separately in troughs of bran with a little meal, and then rubbing them with flannel.

There is a variety of tin-plates called 'terne-plates,' coated with an alloy of tin and lead, in which the proportions vary from one of lead and two of tin to two of lead and one of tin. They are largely exported to Canada, where they are used for roofing.

The manufacture of tin-plates has extended very rapidly of late years; and in 1880, 290 mills were at work in Great Britain which produced in that year no less a quantity than 237,084 tons of manufactured material. The exports, which in 1864 amounted to 1,003,569 cwts., of the declared value of £1,264,100, had in 1880 increased to 217,718 tons, valued at £4,457,887.

TI'NSEL OF THE FEU, in the Law of Scotland, means an irritancy or forfeiture of a feu-right caused by the failure to pay the feu-duty for two whole years. A statute of 1597 authorized, in such a case, the superior to take steps to obtain a decree of declarator that the feu was forfeited; but the vassal might, any time before decree, purge the irritancy by paying the arrear.—TINSEL OF THE SUPERIORITY is a similar remedy which a vassal has against the superior who has not got himself infeft, so as to be in a position to complete the vassal's title. In such a case, the tenant may under the statute 1474 charge the superior, that if he do not within forty days obtain infeftment, he shall loose the tenant or vassal for his (the superior's) lifetime, and thereby all the casualties that may fall to the superior from the act or delinquency of such vassal.

TI'NTERN ABBEY, a famous ecclesiastical ruin on the right bank of the Wye, in Monmouthshire, about 9 miles south-south-east of Monmouth. The Abbey—properly so called—was founded in 1131 for Cistercian monks, by Walter de Clare, and dedicated to St. Mary; but already in the previous century a church had been built, and in 1268, mass was celebrated by abbot and monks for the first time. The style of architecture is a transition from Early English to Decorated, and is very fine. Most of the building, except the roof and tower, remains. T. A. owes not a little of its celebrity to Wordsworth's poem, entitled *Lines composed a few Miles above Tintern Abbey, on revisiting the Banks of the Wye*—though in reality the poem has nothing whatever to do with the Abbey, which is not once mentioned or alluded to in it.

TINTORETTO, a Venetian historical painter, so called from the fact of his father being a dyer (*Tintore*), but whose real name was JACOPO ROBUSTI, was born in 1512. He studied for a short time under Titian, but appears to have been for the most part self-taught. His motto was a very fine one: *Il disegno di Michael Angelo, e 'l colorito di Tiziano* (the design of Michael Angelo, and the coloring of Titian); but it cannot be said that he adhered to it, and he is certainly a long way inferior to either artist. Still, his assiduity, when young, in acquiring a varied knowledge of the human figure under all possible aspects of light and shade, commands respect, in spite of the theatrical means to which he often resorted; and the rapidity of his pencil (which got him the name of *Il Furioso*) is at least astonishing. Sebastian del Piombo remarked that T. could paint as much in two days as he could do in two years. A catalogue of T.'s works, specimens of which are to be found in almost all galleries, is impossible within our limits. We can only mention a few of the more famous, as 'Belshazzar's Feast, and the Writing upon the Wall' (fresco, for the Arsenal at Venice), 'The Tiburtine Sibyl,' 'The Last Supper and the Washing of the Disciples' Feet,' 'A Crucifixion,' 'The Worship of the Golden Calf,' 'The Last Judgment' (the last two immense pictures 50 feet high, and very splendid in conception); 'St. Agnes restoring to Life the Son of a Prefect,' 'The Miracle of St. Mark,' a 'Resurrection of Christ,' 'The Slaughter of the Innocents,' and a grand picture of 'Paradise'—34 feet high by 74 long, with upwards of 100 figures. Some of T.'s earlier pictures are very carefully finished, but his later ones are dashed off with a fatal haste, that justifies the remark of Annibal Caracci, that if he 'was sometimes equal to Titian, he was often inferior to Tintoretto.' T. lavishly indulged in *chiar' oscuro*, but his coloring is not gay or brilliant; it is rather cold and leaden, as might be expected of a painter who, when asked what were the prettiest colors, replied: 'Black and white.'

TIPPECANOE', a river of Indiana, U. S., which rises in a lake of the same name in the northern part of the state, flows south-west 200 miles, and empties into the Wabash 9 miles above Lafayette. It is famous for the battle fought on its banks, November 5, 1811, in which the Indians, under Tecumseh's brother, the prophet, were defeated by General Harrison.

TIPPERA'RY, an inland county of the province of Munster, Ireland, bounded on the S. by Waterford; and on the W. by Cork, Limerick, Clare, and Galway. Area, 1659 sq. m., or 1,061,731 acres, of which 843,837 are arable, 178,183 uncultivated, 2359 in towns, and the rest under plantations and water. Pop. (1871) 216,713, of whom 203,227 were Catholics, 13,459 Protestants: this

includes Presbyterians and other sects of Christians; (1881) 199,004, a decrease in ten years of 17,709. In the year 1881, the number of acres under crops of different kinds was 265,760. In the same year the cattle numbered 244,029; sheep, 205,850; and pigs, 74,540. The inhabitants are mostly engaged in agriculture. The annual value of property in the county is £681,172. The number of children attending the national schools in the county of T. in 1880 was 41,512, of whom 40,574 were Roman Catholics, and 820 of the Episcopal Church.

The county of T. for the most part lies in the basin of the river Suir. This river rises near Templemore, in the north of the county; and after traversing T. a distance of about 76 miles, forms for a time its boundary with Waterford, through which county it ultimately passes to the sea. The other rivers of T. are the Nore, the Nenagh, and the Brosna. The lakes are numerous, but of small size. The county is intersected by the Great Southern and Western, and the Limerick and Waterford Railways. The surface is generally plain, and the mountains which diversify it are rather groups than portions of any connected range. These mountains are the Galtees, rising to 3000 feet, Knockmeledown (2700 feet high), and Slievenaman on the south; Keeper Mountain, 2100 feet high, and its group on the west; and the Slievardagh Hills on the east. There is one very curious isolated height called the Devil's Bit, to which many popular legends attach.

The soil of the plain is a rich calcareous loam, singularly fertile and productive, especially a district called the Golden Vein, in the center of which stands the town of Tipperary (q. v.), and which extends from Limerick to the county of Kilkenny. There is another similarly fertile district in the north of the county. In geological formation the plain belongs to the great central limestone district. The mountains are for the most part of clay-slate, surrounded or surmounted by sandstone; the Galtees, together with a contiguous group called Slievenamuck, as well as the intervening valley, being sandstone. There is a large amount of bog in the central and eastern districts, one continuous tract extending a distance of thirty miles. The mineral productions are coal (anthracite), copper, and lead, also zinc and very good fire-clay; and slates of an excellent quality are quarried near Killaloe. Wheat was formerly grown in large quantities; but of late years dairy-farming and the raising of cattle have been rapidly taking the place of the production of cereals. Flax is but sparingly produced.

The county, which sends two members to the House of Commons, is divided into two ridings, North and South, each of which is subdivided into six baronies.

Anciently, T. formed part of the two distinct principalities of Ormond, or North Munster, and Desmond, or South Munster: after the English invasion, T. was formed into a county by King John in 1210; but the authority of the conquerors was long little more than nominal. Eventually, it came to be divided between the Anglo-Norman families of Butler, which held Ormond, and Geraldine, to whom a portion of Desmond fell. The antiquities are numerous, as well Celtic as Anglo-Norman. In the latter, the city of Cashel is specially rich; and the ruin of Holy Cross is a noble specimen of the monastic remains of the medieval period, as the castle of Cahir is of the military and baronial architecture of the same age. There is a series of caves near the border of the county of Cork, in the vicinity of Mitchellstown, which attract much notice as a natural curiosity. They consist of a number of chambers and galleries formed by stalactite deposits, one portion of the range being no less than 870 feet in length.

TIPPERARY, a market-town of the county of the same name, on the river Arra, 111 miles south-west from Dublin by the mail-coach road, and 110 by the Great Southern and Western Railway, with which it is connected by the Limerick and Waterford Railway. T. occupies a central position in a fine county, and carries on, therefore, an extensive trade in butter. Pop. (1881) 7274; town rates levied, £120. The town is of very ancient foundation, and soon after the invasion was occupied as a strong place by the English, who built a castle in it during the Irish expedition of King John. This castle, however, fell soon afterwards into the hands of the Irish under the Prince of Thomond. The town is well built, but of no architectural pretensions, and contains a large and handsome Roman Catholic church, a Protestant church, Presbyterian and Methodist meeting-houses, two National Schools, and one school of the Erasmus Smith endowment.

TIPPOO SAHIB, sultan of Mysore, and son of Hyder Ali (q. v.), was born in 1749. Efforts were made to carefully instruct him in the various branches of learning cultivated by Mohammedans; but T. much preferred the practice of athletic exercises, and the companionship of the French officers in his father's service, from whom he acquired a considerable acquaintance with European military tactics. This knowledge he put to effective use during his father's various wars, by completely routing Colonel Bailey at Perimbakum (10th September 1780), and (18th February 1782) Colonel Braithwaite on the banks of the Kolerun in Tanjore, though these were his only important engagements with the British forces in which he could boast of success. On the death of his father, he was crowned with little ceremony, returning at once to the head of his army, which was then engaged with the British near Arcot. On 28th April 1783, he captured and put to death most of the garrison of Bednore; but news of the peace between France and England having reached his French allies, they retired from active service, and T. ultimately agreed to a treaty (11th March 1784), stipulating for the *status quo* before the war. During the continuance of this peace, he occupied himself in regulating the internal administration of Mysore, sent ambassadors in 1787 to France to stir up a war with Britain, and failing in this, at length so far allowed his inveterate hatred of the English to overcome his judgment, as to invade (April 1790) the protected state of Travancore.

In the ensuing war (1790—1792), the British, under Colonel Stuart and Lord Cornwallis, were aided by the Mahrattas and the Nizam, who detested their powerful and aggressive neighbor equally from fear and religious hatred (T. being a fanatical Mohammedan); and though the tactics of the Sultan in laying waste the Carnatic almost to the very gates of Madras, baffled his opponents for a time, he was ultimately compelled (16th March, 1792) to resign one half of his dominions, pay an indemnity of 3030 lacs of rupees, restore all prisoners, and give his two sons as hostages for his fidelity. Nevertheless, his secret intrigues in India against the British were almost immediately resumed; another embassy was sent to the French; and the invasion of Egypt by the latter in 1799, and T.'s machinations, having become known to the governor-general almost contemporaneously, it was resolved to punish the perfidious sultan. Hostilities commenced in March 1799; and two months after, T. was driven from the open field, attacked in his capital of Seringapatam, and after a gallant resistance, slain. He was buried in his father's mausoleum, 5th May 1769, during a storm of thunder and lightning, which caused the death of several Europeans and natives. His government of Mysore after 1792 was of a most oppressive character, yet T. was extremely popular, and after his death was esteemed by the Mohammedans as a martyr to the faith of Islam. Of the chief articles of *virtù* with which his palace abounded, many are now in Fife House, Whitehall (having been removed thither from the East India House in Leadenhall Street), as also the half of his library, the other half being preserved at Fort-William, Bombay.

TI'PULA AND TIPU'LIDÆ. See CRANE-FLY.

TIRABOSCHI, GIROLAMO, an eminent Italian author, was born at Bergamo, 28th December 1731, studied at Monza, and afterwards entered the order of the Jesuits. Towards 1766, he was appointed Professor of Rhetoric at Milan, where he wrote his first work *Vetera Humiliatorum Monumenta* (1766); and in 1770 succeeded Father Granelli in the post of librarian to the Duke of Modena. T. now availed himself of the rich stores of the ducal library, besides making extensive researches in other archives, to compose his *Storia della Letteratura Italiana* (History of Italian Literature), which began to appear in 1772, and was finished in 1783 in 13 vols. It embraces the history both of ancient and modern Italy, and is especially valuable for the light which it throws upon the intellectual condition of the Peninsula during the dark ages, and the brilliant period from Dante to Tasso. T. ends his elaborate survey with the close of the 17th century. It is impossible to praise too highly the learning and the conscientious accuracy of the author, even although the circumstance that many of the epochs have since been made the subject of minute and special inquiries, necessitates a revision of parts of the work. A second edition was edited by T. (1787—1794), and abridged translations have appeared in French and German. The best edition is that published at Milan (16 vols. 1822—1826). A continuation embracing the literature of the 18th c., was written by Lombardi (*Storia della Letteratura Itatiana nel Secolo XVIII.*). T. died at Modena, June 3, 1794. Other works by this author are *Biblioteca Modenese* (6 vols., Mod. 1781—1786); and *Memorie Storiche Modenesi* (3 vols., Mod. 1793).

TIREE', one of the Inner Hebrides, included in Argyleshire, lies 20 miles north-west of Iona. It is 13 miles long, and over 6 miles in extreme breadth. The surface is low, rising in the north to little more than 20 feet, and in the south to about 400 feet above sea-level. The absence of trees and shrubs gives to the island a bleak appearance. There are numerous small lakes. Upwards of 5000 acres are under tillage, while 10,700 acres are in pasture or waste-land. Some interest attaches to the island from the number of Scandinavian forts which dot the shores, and from the standing-stones, ruined churches, and ancient graves which occur in the interior. Pop. (1881) 2730, who support themselves by rearing cattle, fishing, and exporting poultry and eggs.

TIRE'SIAS, in Greek Mythology, figures as a famous prophet, who, according to one legend, was struck blind by the goddess Athena, because he had seen her bathing. Another legend rep-

resents Hera as depriving him of his sight because, being made arbiter in a dispute between her and Zeus, he had decided in favor of the latter; when Zeus as a compensation granted him the inner vision of prophecy, and prolonged his life for several generations. He is consequently prominent in many of the mythical stories of Greece, but at last found death by drinking from the well of Tilphossa. Even in Hades, T. retained his prophetic power.

TIRLEMONT (Flemish, *Thienen*), a town of Belgium, in South Brabant, on the Great Geete, 38 miles east-south-east of Brussels, on the Brussels and Cologne Railway. The church of St. Germain, on an eminence, dates apparently from the 9th c., and contains an alter-piece by Wappers. Beer and hosiery are manufactured. T. was ravaged by Marlborough in 1705; and here the French, under Dumouriez, defeated the Austrians in 1793. Pop. (1876) 13,296.

TI'RNOVA, a town in the principality of Bulgaria, on the Jantra, 35 miles south-south-east of Sistova. It was formerly the chief town of Bulgaria; and since 1878 (see BULGARIA) it is again the seat of the Chambers and the national government. There are numerous mosques, churches, and synagogues; dyeing is carried on, and silk and coarse cloth are manufactured. The population is estimated at 16,000.

TI'RYNS, an ancient city of Argolis, in the Peloponnesus, one of the very oldest cities of Greece, situated a short distance south-east of Argos, near the head of the Argolic Gulf. According to the common tradition, it was founded by Prœtus, a mythic king of Argolis; and its massive walls, like other rude massive structures in Greece of unknown antiquity, were reputed to be the work of the Cyclopes. Prœtus is said to have been succeeded by Perseus; and in this place Hercules was believed to have passed his youth. At the time of the Trojan War, T. appears to have been subject to the kings of Argos. Some time subsequently to the battle of Platæa (to which the Tirynthians sent troops), probably about the year 468 B.C., the city was taken by the Argives, and entirely destroyed; and after this period T. remained uninhabited, the walls of the citadel only being left standing, the wonder and admiration of later ages. T. affords one of the most interesting specimens of what is called Cyclopean architecture, the ruins of this place, and those of the neighboring city of Mycenæ, being the grandest of all in Greece. The Acropolis, or citadel of T., was built on the summit of a low, flat, rocky hill, rising abruptly out of the dead level of the plain of Argos, and appears to have consisted of an upper and a lower enclosure of nearly equal size, with an intermediate platform. There were two main entrances, on the east and on the south sides, with a postern on the west. The entire circuit of the walls still remains more or less preserved; they are upwards of 20 feet in thickness, and are formed of unhewn stones of enormous size, rudely piled in tiers one above the other, without the use of mortar or cement, the interstices being filled up with smaller stones, to as to make the whole mass solid and compact. There are several covered galleries of singular construction in the body of the wall, on the east and the south sides, the roof being formed by sloping the courses of masonry on each side of the passage at an angle to each other. One of them has six recesses, or niches, on the outer side of the walls, intended probably to facilitate defence. Altogether, 'this colossal fortress is the greatest curiosity of the kind in existence.'

TI'SANE, TISAN, or PTISAN, an infusion made of certain herbs, leaves, or flowers, used as tea for medicinal purposes. It is a very favorite form of remedy in the domestic medicine of France.

TISCHENDORF, LOBEGOTT FREDERICK CONSTANTINE VON, a very eminent Biblical scholar, was born at Lengenfeld, in Saxony, on January 18, 1815. His labors in search of the best and rarest MSS. in reference to the Bible, in which he was liberally assisted by the Saxon and Russian governments, were exceedingly valuable. Among the most important of his numerous excellent works are the editions of the *Sinaitic MS* (1862, 1863, 1865), the *Eighth Critical Edition of the New Testament* (1864—1872), and the *Monumenta Sacra Inedita* 1855—1870). After being an extraordinary and ordinary professor at Leipzig, from 1845, he became Professor of Theology and of Biblical Palæography in 1859, a chair in the latter subject having been instituted for him. He was created a Count of the Russian empire, an LL.D. of Cambridge, a D.C.L. of Oxford, &c. He died on December 1, 1874.

TISSUES, ANIMAL, may be either normal or pathological. The most important of these tissues have already been considered in special articles, and we shall here merely notice the view at present most generally adopted regarding their classification (see HISTOLOGY). The normal tissues are divisible, according to Virchow and his followers, into three groups or categories. We have (1) tissues which consist exclusively of cells, when cell lies close to cell; or (2) tissues in which one cell is regularly separated from the others by a certain amount of intermediate matter, or intercellular substance; or (3) tissues in which the cells have attained specific, higher forms of development, by means of which their constitution has acquired an entirely peculiar type. As illustrations of the first group of tissues, the simple cellular tissues in the modern sense (cellular tissue here being quite distinct from areolar or connective tissue), we may take the epithelial formation, such as occur in the epidermis and the nails, and in the epithelium of mucous and serous membranes, in the crystalline lens of the eyes (which is originally a mere accumulation of epidermis), and in the glands. The second group is formed by the connective tissue, which is composed of intercellular substance, with cells of various forms embedded in it, and includes cartilage, fatty tissue, &c. In the third group, which is somewhat heterogeneous, the structures are usually more or less tubular. This group includes the muscles, nerves, and vessels, and Virchow also places the blood in it. Such an arrangement as this is quite distinct from, and altogether at variance with, those adopted a comparatively few years ago.

This arrangement has reference to General Histology (*tissues*, properly so called), while *that* has reference to Special Histology, or the structure of organs in which a combination of various tissues may enter. Thus, the *osseous tissue* of general histology consists of bone-cells + calcified intercellular substance, while *bone as an organ* consists of osseous tissue + medullary tissue + periosteum + vessels + nerves; similarly, nervous tissue is by no means identical with cerebral matter, which additionally contains membranes, vessels, &c.

Morbid tissues may be classified upon exactly the same plan as the physiological or normal tissues. The belief is gradually extending that there is nothing peculiar or specific in pathological structures, or, in other words, that every pathological tissue has its physiological prototype, and that 'no form of morbid growth arises which cannot in its elements be traced back to some model, which had previously maintained an independent existence in the economy.'—Virchow's *Cellular Pathology*, translated by Chance, p. 60. The distinguished pathologist whose words we have just quoted, maintains that there is no other kind of heterology in morbid structures than the abnormal manner in which they arise, and that this abnormity consists either in the production of a structure at a point where it has no business, or at a time when it ought not to be produced, or to an extent which is at variance with the typical formation of the body; 'but,' he adds, 'practical experience shows us that it would be altogether incorrect to conclude from the mere correspondence of a pathological tissue with a physiological one that the case would continue to follow a benignant course.' The curious bodies provided with large nuclei and nucleoli, which have been described by many pathologists as 'the specific polymorphous cells of cancer,' are merely irregularly developed epithelial cells, such as occur, for example, in the lining of the urinary passages; and the apparent heterology of other morbid growths may be similarly explained.

TISSUES, VEGETABLE. See CELLULAR TISSUE, VASCULAR TISSUE, and VEGETABLE TISSUES.

TIT, or TITMOUSE (*Parus*), a genus of birds of the order *Insessores*, tribe *Conirostres*, and family *Paridæ*. The *Paridæ* are small birds, of which there are more than 50 known species, widely distributed throughout Europe, Asia, Africa, and North America. They are more numerous in cold and temperate than in tropical regions, those which are found within the tropics being mostly inhabitants of elevated mountainous districts. The bill is small, short, somewhat conical, the tip entire, the base beset with hairs, and the nostrils generally concealed by feathers. The wings are not very long, but are pointed; the tail is rounded or even; the tarsi long, slender, scaled in front, the inner toe shortest, the claws long and curved. The plumage is beautiful, often gay. The popular names Tit and Titmouse are very generally given to all the *Paridæ*. They are bold sprightly birds, extremely active, flitting from branch to branch, running rapidly along branches in quest of insects, and often clinging to the under-side of branches with their back downwards. They feed not only on insects but on grain and seeds, have no objection to carrion, and sometimes kill young and sickly birds by strokes of their bill. They are very pugnacious, and the female Tit shows great courage in defence of her nest, often continuing to sit when the nest is approached, and vigorously assailing the intruding hand with her bill. In winter, many of the species gather into small flocks, and approach houses and villages, competing with sparrows and chaffinches for a share of the food of domestic poultry. Most of the tits lay at least six eggs, some of them twelve or more, and even in temperate countries they often produce two broods in a year. They generally build in trees. The young are fed chiefly on caterpillars.

A pair of Blue Tits have been observed to carry a caterpillar to their nest, on an average, every two minutes during the day, so that these birds must be extremely useful in preventing the multiplication of noxious insects. Seven species are found in Britain, but one of them, the CRESTED TIT (*Parus cristatus*) is a mere

accidental visitor. The GREAT TIT (*P. major*) is the largest European species. It is common in almost all parts of Europe. It is not quite six inches long; the head and throat are black; the cheeks are white; the back, breast, and sides yellowish; the wings and tail grayish. Its usual note is a kind of chatter, but it sometimes imitates the notes of other birds. The BLUE TIT (*P. cæruleus*) and the COLE TIT (*P. ater*) are very common in Britain. The Blue Tit is perhaps the most pert and audacious of all the British species. It very generally receives the familiar name of *Tomtit*. The upper part of the head is light blue, and a bluish tinge

Cole Tit (*Parus ater*), and Long-tailed Titmouse (*Parus caudatus*).

prevails in the plumage. The LONG-TAILED TIT (*Parus caudatus*), common in Britain, has the tail about as long as the body. Its head is white, contrasting beautifully with the deep black of the back; the tail is also black, with white edges. The nest of this bird is a beautiful structure, of moss and wool externally covered with lichens, and profusely lined with feathers, nearly oval, with a small hole in the upper part of one side. Still more interesting is the nest of the PENDULINE TIT (*Aegithalus pendulinus*) of the south of Europe, which in form resembles a flask, and is generally suspended at the end of a flexible twig, in a situation near to or overhanging water. It is nicely woven of fibres of bark and the down of willow or poplar catkins, and the opening is in the side. The CHICKADEE or BLACKCAP TIT (*Parus atricapillus*) is very common in North America. The TUFTED TIT (*Lophophanes bicolor*) is the largest American species.

TITA'NIUM (sym. Ti, eq. 25—new system, 50—sp. gr. undetermined) is a comparatively rare metal, which, according to the method by which it is procured, occurs as a gray, heavy, iron-like powder, which burns with brilliant scintillations in the air, and is converted into titanic acid, or in prismatic crystals. At 212°, it decomposes water, and it is soluble in hydrochloric acid. It is obtained in the crystalline form by heating sodium in the vapor of bichloride of titanium. It never occurs native, but is found in association with other elements in various minerals, of which the most important are *Anastase*, *Rutile*, and *Brookite*, containing titanic acid; *Titanite*, containing silicate of lime and titanic acid; *Perowskite*, containing titanite of lime; *Æschynite*, containing titanic and niobic acids, and the oxides of cerium and lanthanum; and lastly, *Titanic Iron*, composed of titanate of protoxide of iron. A remarkable artificial compound of the metal is often found in the form of copper-colored cubic crystals, adhering to the slags of iron furnaces. They are hard enough to scratch agate; and no acid except a mixture of nitric and hydrofluoric acids has any action on them; but they are volatile at an extremely high temperature. They consist of a combination of cyanide with nitride of titanium, and are represented by the remarkable formula $TiCy,3TiN$. The most important compound of this metal is *Titanic Acid* (TiO_2), which occurs in the minerals *Menaccanite* and *Iserine*, as titanate of iron, but is more common in the uncombined state, as titanic anhydride, in the form of rutile, brookite, and anastase, each of which possesses a distinct crystalline form, and has a different specific gravity. Hence, titanic acid in the anhydrous state is trimorphous. It is usually obtained by a somewhat complicated process from rutile. Titanium was discovered by Gregor, as a constituent of menaccanite, in 1791.

TI'TANS AND TITA'NIDÆ (originally called *Ouraniones*, Celestials), in Greek Mythology, were the sons and daughters of Uranus (Heaven) and Gæa (Earth). Their names, as commonly given, were: Oceanus, Cœus, Crius, Hyperion, Iapetus, Kronos, Theia, Rhea, Themis, Mnemosyne, Phœbe, and Tethys; Dione, Phorcys, and Demeter are added by some writers. Instigated by their mother, the T., headed by Kronos, rose against their father, emasculated and deposed him, and liberated their brothers the Hecatoncheires (Hundred-handed) and the Cyclopes (q. v.), from Tartarus. Kronos being made king, threw the Cyclopes back again to Tartarus, and married his sister Rhea. In order to escape being deposed by one of his own children, as it was foretold he would be, Kronos swallowed each as it was born. Rhea, when she gave birth to Zeus (q. v.), saved his life by giving a stone wrapped in a cloth to Kronos, who swallowed it, believing it to be his child. Zeus, when he grew up, gave his father a potion which caused him to vomit the stone and the children he had swallowed. Assisted by his brothers and sisters, along with the Cyclopes and Hecatoncheires, Zeus began with the T. the ten years' conflict which resulted in the complete triumph of the former, and the overthrow of the latter, who were hurled down into a dungeon below Tartarus, surrounded by a brazen wall, and guarded by the Hecatoncheires. During the war, Zeus and his allies occupied Mount Olympus in Thessaly, his opponents being encamped on Mount Othrys.—The name T. is also given to the descendants of the T., such as Prometheus, Hecate, Helios, Selene, &c.

TITHES (A.S. *teotha*, a tenth; Lat. *decima*, i. e., *pars*, a tenth part), the tenth part of the produce of the land, which, by ancient usage, and subsequently by law, is set aside for the support of the clergy, and other religious uses. This provision for the clergy passed at a very early period from the Jewish into the Christian Church, and indeed the same or some analogous appropriation has been traced in the other ancient religions. It is observable under the patriarchal system in the words employed by Jacob (Gen. xxviii. 22), and in the offering of Abraham to Melchisedec (Gen. xiv. 20); and mystical reasons have been devised for the selection of the tenth part, rather than any other fractional portion of the produce of the earth, to be consecrated to the uses of religion and the ministers of religion. (See Spencer, *De Legibus Hebræorum*, iii. 1—10.) The details of the institution among the Jews will be found in Levit. xxvii., Deut. xiv., and many other places. The tribe of Levi not having lands assigned, as was the case with the other tribes, drew their support from this impost.

In the Christian dispensation, the very circumstance of the existence of the clergy as a distinct class supposed a certain fixed provision for their maintenance. The necessity of such provision, and the right on which it is founded, is distinctly expressed in many passages and allusions of the New Testament, as Matt. x. 10, Luke x. 7, Rom. xv. 27, 1 Cor. ix. 7—14. The obligation in the general sense which these passages involve has been put forward in ecclesiastical legislation from the earliest period. The apostolical canons, the apostolic constitutions, St. Cyprian on *The Unity of the Church*, and the works of St. Ambrose, St. Chrysostom, St. Augustine, and the other Fathers of both divisions of the church, abound with allusions to it. As yet, however, this obligation was discharged mainly in the form of voluntary offerings; and the legislation of the first Christian emperors, while it presupposed the duty of maintaining the clergy, and even assigned lands and other property for their support, did not extend to any general enactment for the payment of the tenth of the produce of the lands. The Council of Tours, 567 A.D.; the second Council of Macon, 585; that of Rouen, 650; of Nantes, 660; of Metz, 756; and some others, distinctly sanction that form; and at length Charlemagne by his capitularies formally established the practice within those portions of the ancient Roman Empire to which his legislation extended.

From this and other sources, the payment of a tenth to the church extended throughout Western Christendom. By some, the claim was held to be of divine law; by others, of human institution; but in the gradual progress of relaxation, it came to pass that the right thus established solely for the church began to be usurped for themselves and for purely secular uses by nobles or other powerful laymen. See IMPROPRIATION.

The first introduction of tithes into England is ascribed to Offa, king of Mercia, in the close of the 8th century. The usage passed into the other divisions of Saxon England, and was in the end made general for all England by Ethelwulf. It would seem that at first, although all were required to pay tithes, it was optional with each to select the church to which his payment should be made; but by a decretal of Innocent III., addressed to the Archbishop of Canterbury in 1200, all were required to pay tithes to the clergy of their respective parishes, and this parochial distribution of tithes has ever since obtained in England. The ancient canon and civil law distinguishes many varieties of tithes, into which we shall not enter, as royal, indominicate, fiscal, salic, &c. We shall confine our remarks to the provisions of the English law, premising that in most respects it is founded upon the general principles of the civil and canon law.

Tithes are of three kinds—*prædial*, *mixed*, and *personal*. Prædial tithes are those which arise immediately from the earth itself, as of grain of every kind, fruits, and herbs. *Mixed* tithes are those proceeding from things nourished by the earth, as calves, lambs, pigs, colts, chickens, milk, cheese, eggs, &c. *Personal* tithes are those arising from the profits of personal industry, in the pursuit

of a trade, profession, or occupation; but it is commonly held that personal tithes were ordinarily paid in the form of a voluntary offering at Easter or some other period of the year. From these explanations, it will be understood that no tithe was due from the proceeds of mines or quarries, as their produce is not the result of any growth or increase of the earth, but forms part of its substance; nor from houses, as having no annual increase. The common law, moreover, held wild animals, game, fish, &c., not to be proper subjects of tithe, as also tame animals kept for pleasure or curiosity, and not for profit or use.

A more arbitrary distinction is into *great* and *small* tithes, the first being tithes of corn, hay, wood, &c.; the second being the other kinds of prædial tithes, as well as all personal and mixed tithes. This distinction, although purely arbitrary, is important, inasmuch as the great tithes of a parish belong to the Rector (q. v.), and the small tithes to the Vicar (q. v.). T. were originally paid 'in kind;' that is, by the actual numeration of the products of the land, and the apportionment in each of the numerical tenth part, as of the tenth sheaf, the tenth lamb, calf, &c. The inconvenience and trouble, as well as the unsettled and variable quantities involved in this mode of payment, led to early attempts to provide other modes of apportioning the result (the particular manner being called technically a *modus decimandi*, or simply a *modus*. This was done either by making an agreement to pay a fixed quantity irrespective of actual produce in each year, or by a money payment settled between the parties; or by a partial substitution of payment or labor, as when the party contributed a smaller quantity of produce, but free from the expense of harvesting, carriage, &c.; or finally, by a payment of a bulk sum in redemption of the impost, either for a time or for ever, as the case might be, in which case the land so redeemed became temporarily or permanently tithe-free. By such compositions, many lands in England were made anciently tithe-free, and have so continued; but by 1 Elizabeth 19, and 13 Elizabeth 10, such alienations of tithe-payment were restricted to a term of twenty-one years, or three lives.

Besides the exemption from tithe thus created, a still more comprehensive occasion of immunity is traceable to the exemption enjoyed by the lands of religious houses. Originally, convents occupying lands in England paid tithes like other landowners to the parochial clergy; but a decretal of Paschal II. exempted them from such payments in regard to lands held by themselves in their own occupation. This exemption was confined by subsequent legislation to the four orders—Templars, Hospitallers, Cistercians, and Præmonstratensians, and after the 4th Council of Lateran (1215), only in respect of lands held by them before that year. Frequently, however, exemptions were given in favor of particular houses; and in cases in which religious communities were themselves the incumbents of a parish, as they could not pay tithes to themselves, their own lands within such parish became exempt by what was called 'unity of possession.' And thus it came to pass that a large extent of land in England and Wales was held free of tithes. Now, when, on the suppression of monasteries, those lands were assigned to lay possessors, they passed of course into lay hands with the same immunity; and hence this exemption from tithe has become perpetual even in the hands of lay possessors, as, on the other hand, by a similar transfer, lay proprietors have in many instances acquired the right to tithe, and the property of many rectories.

The arrangements between parties for commuting the mode of payment, to which allusion is made above, were permitted, and even protected by law; but they were nevertheless purely voluntary and partial, and the perpetually recurring contests to which the system led, as well as the oppressive nature of the exaction when the parties from whom it was claimed did not belong to the church established by law, rendered the impost odious; and in Ireland it became impossible to enforce its collection in great part of three of the four provinces. A measure of commutation became absolutely necessary. This had been recommended by committees as far back as 1822, but it did not pass into law until 1838. Various statutes for England or Ireland have since been enacted regulating the payment of tithe—6 and 7 Will. IV. c. 71, 7 Will. IV. and 1 Vict. c. 69, 1 and 2 Vict. c. 64, 2 and 3 Vict. c. 32, and 5 and 6 Vict. c. 54. Their object for England is to substitute a money rent-charge, varying on a scale regulated by the average price of corn for seven years, for all the other forms of payment. This commutation may either be voluntary, or may be effected by the Tithe Commissioners, according to a valuation. Land not exceeding twenty acres may be given by a parish in commutation of tithes; but only in the case of ecclesiastical persons, and not of lay impropriators. Similar arrangements have been made in those few Catholic countries in which tithes still continue to be paid.

In Ireland, the settlement was effected by a general commutation of tithe into a money rent-charge, regulated by a valuation of the tithes (one-forth being deducted for the cost of collection), and payable by the proprietors, who should receive it from the occupiers of the land. By the Irish Church Act (32 and 33 Vict. c. 42), this rent-charge became vested in the commissioners of church temporalities, with power to sell such rent-charge to the owner of the land charged therewith at 22½ years' purchase. Power is also given to such purchaser to pay by installments for 52 years, at the rate of 4½ per cent. on the purchase-money, deducting the estimated charge for poor-rate; the rent-charge being extinguished at the expiration of the 52 years.

TI'THING, an ancient Saxon division of the country, consisting of the tenth part of a hundred, being occupied by ten families, each of whom was responsible for the good behavior and peace of the rest. The institution has been long growing obsolete, and the Police Constables (q. v.) now supersede the officer called a tithing-man.

TITHO'NUS, son of Laomedon, brother of Priam, and spouse of Eos, the goddess of Morn. The story is that Eos, in asking immortality for her spouse, forgot to ask at the same time eternal youth, so that in his old age, he became completely shrunk and decrepit, whereby his 'cruel immortality' was rendered a burden to him.

TITIAN, or TIZIANO, Vecelli, the head of the Venetian School, and one of the greatest painters that ever lived, was born of a good family at Capo del Cadore, in the Friulian Alps, in the year 1477, or, according to some, in 1480. His predilection for drawing caused his father to send him to Venice at the age of ten, that he might learn to be a painter. His instructors were Sebastiano Zuccati and the two Bellinis, particularly Giovanni; but the painter that exercised the greatest influence on his style was Giorgione (q. v.). So vivid and keen was his appreciation of the distinctive features of any artist's work, that he never failed to reproduce them with striking fidelity, and even to leave the impression that he had beaten the master whom he imitated, in his own style. It was owing to this irrepressible superiorty that the friendship between Giorgione and him was interrupted. The first work that brought T. prominently into notice was his completion of the 'Homage of Frederick Barbarossa to Pope Alexander III.' (1512), begun by Giovanni Bellini, but left unfinished by that artist at his death. The Venetian senate, who had commissioned the piece, were so much pleased with T.'s performance, that they conferred on him an office with an annual salary of 300 crowns. In 1514, he painted a 'Bacchus and Ariadne,' and other works of a similar kind, for the Duke of Ferrara, a portrait of the duke himself, and of the lady who afterwards became his wife, besides a picture of the 'Tribute-money.'

While residing at the court of Ferrara, he made the acquaintance of the poet Ariosto, who sat to him for his portrait. On his return to Venice, he painted an 'Assumption of the Virgin,' one of his grandest achievements. His reputation now rapidly rose. Pope Leo X. and Raphael both invited him to Rome, and Francis I. to France; but he declined. During 1520—1530, the most celebrated of his numerous productions were—'St. Peter, Martyr,' a work of unsurpassable beauty; 'Victory of the Venetians over the Janizaries;' and 'St. Sebastian.' In 1530, his friend Aretino (q. v.), the poet, introduced him to the notice of the Emperor Charles V., whose portrait he painted at Bologna, and who gave him several other commissions. From Bologna, T. proceeded to Mantua, where he executed a great number of works for Duke Frederico Gonzaga. In 1532, he appears to have accompanied Charles to Spain, where he remained for three years, and painted several of his masterpieces, now found in that country. In 1537, he executed an 'Annunciation;' in 1541, a 'Descent of the Holy Ghost upon the Apostles,' a 'Sacrifice of Abraham,' 'David and Goliath,' and a 'Death of Abel;' and in 1543, pictures of the 'Virgin' and 'San Tiziano,' and portraits of Pope Paul III., Cardinal Farnese, and Duke Octavio Farnese, at Rome, where he remained three years. The Emperor Charles V., who greatly admired his genius, twice called him to Augsburg (1547 and 1550). Among the religious works which he executed for Philip II. of Spain are a 'Last Supper,' 'Christ in the Garden,' 'St. Margaret with the Dragon,' and a 'Martyrdom of San Lorenzo;' besides these, we notice a 'Venus and Adonis,' a 'Danaë,' a 'Medea and Jason,' and other classic subjects. A complete catalogue of T.'s works does not exist, but the number known is extraordinarily great—upwards of 600.

T. died of the plague in 1576, having attained the extreme age of 99. He is best studied at Venice or Madrid, but splendid specimens of his work are to be seen in the chief European galleries. As already observed, he had at first a tendency to reproduce the style of acknowledged masters, but his genius soon emancipated itself from all imitativeness, and displayed a glorious originality and power. The luxury of light did never so enrich a painter's canvas. This is, indeed, his transcendent excellence. Not inaccurate in design, not sterile in invention, not infelicitous in composition—these, his minor merits, are nevertheless wholly thrown into the shade by the splendor, boldness, and truth of his coloring, which alone has sufficed to give him a place alongside the greatest

names in art, Raphael, Leonardo da Vinci, and Michael Angelo. —See Hume's *Notices of the Life and Works of Titian* (Lond. 1829); Northcote's *Life of Titian* (Lond. 1830); and *T., his Life and Times*, by Crowe and Cavalcaselle (Lond. 1876).

TITICA'CA, LAKE. See PERU.

TITLARK AND TITLING. See PIPIT.

TITLE, REGISTRATION OF, in England, is a modern experiment, set on foot after long-continued opposition, and still frowned on by the solicitors, who conceive that its operation will be to reduce their emoluments. Owing to the total want which had always existed of a register for deeds or writs connected with the transfer of land, except in the counties of Middlesex and York, the complexity and uncertainty attending the operations of conveyancing had long been the opprobrium of English law, and the mercantile classes at last called for a remedy by which an acre of land might be sold with the same expedition and certainty as bank stock.

Under the system referred to, so far from expedition being a feature of conveyancing, delay, expense, and insecurity were the chief characteristics. It was till 1874 the inveterate practice for a purchaser of land to demand, and for the vendor to give, what is called a sixty years' title—i. e., he must show the successive owners for sixty, and since 1874 for 40 years previous to the sale, and all that these owners did in connection with it. This created great expense and delay. But if the property were sold next month, or next day, precisely the same process had to be repeated between the new purchaser and his vendor, for what might have been done between other parties previously was not binding, nor was it safely to be acted on by their successors in the property. These evils called loudly for some remedy, and of late years all the legal reformers have been busy with projects to provide some relief. An important impetus was given to reform by the passing of the Irish Incumbered Estates Act in 1848, the object of which was to break up and compel a sale of the deeply incumbered estates of Ireland. In 1854, a similar statute was applied to the estates of the West India Islands. In 1862 two acts passed for establishing in England a Land Registry, 25 and 26 Vict. 53, 67, for registering indefeasible titles, but they were confined to good marketable titles. Land of the value of about £6,000,000 had been registered under those Acts of 1862, when a more elaborate scheme was prepared by the Land Transfer Act, 1875, 38 and 39 Vict. 87, which greatly amplified and matured the previous efforts in the same direction. The office of Land Registry is conducted by a registrar, appointed by the Lord Chancellor, who must be a barrister of ten years' standing. He has assistants and clerks. The office has a seal and various forms to be used in connection with the business. The fees are all fixed by the Lord Chancellor and the Treasury, and these are paid by means of stamps. Power is also given by the Act to create hereafter district registries. And it is provided that any land situated in Middlesex and Yorkshire, two counties which already had land registries, should, if registered under the new Act, be exempt from the jurisdiction under the local acts, it being contemplated that the general law now established will gradually supersede the former local machinery.

Under the Land Transfer Act, 1875, any person who has contracted to buy freehold land, or any owner or any person having power to sell it, may apply to the registrar to be registered, with an absolute title or with a possessory title only. In case of a purchaser applying, the vendor must consent. The registrar must approve of the title submitted, and in case of a sale the vendor and his solicitor must make an affidavit that they have produced all the deeds, wills, instruments of title, and all charges and incumbrances affecting the title, as well as all facts material. The registrar can also compel third parties to produce deeds relating to the land. If doubtful questions as to law or fact arise in reference to it, the registrar may refer a case for the opinion of the High Court of Justice; and that opinion will be conclusive, because all parties having any possible interest are fully heard by the Court. The freehold absolute title will show all incumbrances on such land, and other rights which the Act declares not to be incumbrances. The possessory title does not prejudice the enforcement of adverse rights which exist at the time of registration, but in other respects it has the same effect as the absolute title. Leasehold lands may also be registered, and they are registered in a separate register. When once the title is registered, no adverse title will acquire any advantage by length of possession. The registered proprietor can by a simple form charge or burden the land with a payment of a sum of money at an appointed time. When the registered land is sold, the tranferee's name is entered on the register, and a land certificate given to him. Any person claiming on adverse interest may lodge a caution having the effect of entitling him to notice of all future dealings with the property if registered, or he may lodge a like caution against the land being registered at all. No notice of a trust is to be entered on the register, and a trustee selling land may authorize the purchaser to be registered as the first proprietor. The Land Transfer Act is not compulsory, but it was expected that it would gradually become generally accepted when the simplicity it secured for titles came to be better known.

TITLE-DEEDS are the evidences of ownership of real property in this country. Each owner is supposed to be in possession of his own, either by himself or his solicitors; and the ownership of the title-deeds passes along with that of the lands themselves. In England there is no general register, except in Middlesex and Yorkshire, and elsewhere to the extent allowed under the Land Transfer Act. It is a dangerous thing to part with title-deeds, for, by merely pledging them as a security for money, a mortgage may be created over the lands. In Scotland, there is a general register where all title-deeds may be kept, or authentic copies, so that the loss of one may be replaced without much difficulty.

TITLES OF HONOR, designations to which certain persons are legally entitled, in consequence of possessing particular dignities or offices. King and Emperor are titles of honor belonging to the sovereigns of different countries; and Your Majesty is the form of address to which, by the usage of most European countries, they are entitled. Your Grace was in England, in former times, the usual mode of addressing the sovereign. The epithet Majesty, taken from the *majestas* of the emperors of Rome, was adopted by the emperors of Germany, who considered themselves their successors; but its use by other European sovereigns is of comparatively recent date. Henry VIII. was the first king of England, and Henry II., the first king of France, who adopted it. Your Highness is the style adopted by the sultan of Turkey. The proper style of the reigning sovereign of the United Kingdom is, 'Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith.' The sons of the sovereigns of England are styled Princes, and their daughters Princesses; and the sovereign's eldest son is Prince of Wales (q. v.). The title of Royal Highness is given to all the children of the sovereign, and by letters-patent under the Great Seal in February 1864, her Majesty declared her pleasure that the children of the sons of the sovereign should also enjoy the same title. The different grades of the peerage have their several titles —Duke, Marquis, Earl, Viscount, and Baron—each of which was in its origin a name of office involving certain specific duties. See FORMS OF ADDRESS, COURTESY TITLES.

Though most European countries have their dukes, marquises, counts, viscounts, and barons, these often differ considerably in rank from the seemingly corresponding titles in Britain, and the English rules and practices regarding title are not applicable abroad. The complicated system of titles by law, and still more by courtesy, which prevails in England, is a source of endless perplexity to such foreigners as endeavor to make themselves acquainted with our usages.

TI'TULAR, one who enjoys the bare title of an office, without the actual possession of that office. Thus, the English kings styled themselves kings of France from the time of Henry IV. down to the year 1800; and previous to the recent changes in Italy, the king of Sardinia, as well as the king of Naples, was titular king of Jerusalem. In English Ecclesiastical Law, a titular is a person invested with a title, in virtue of which he holds a benefice, whether he performs its duties or not.—In the law of Scotland, the term has received another acceptation. When the king, at the Reformation, became the proprietor of all church lands, he erected the monasteries and priories into temporal lordships, and bestowed them on laymen, who were known as Lords of Erection, or Titulars; this latter name indicating that they had the same title as had formerly been possessed by the religious houses to the lands and tithes. See TEINDS.

There are many titular dignities in the Roman Catholic Church; but the class of them which is chiefly noticeable is that which has grown out of the separation between the Eastern and Western churches. It is well known that the Roman pontiff, notwithstanding the schism, claims to retain authority over the entire extent of Christendom; and even where there is not any longer resident within the limits of an ancient church or province a body of Christians of the Roman communion, the pope claims to appoint an ecclesiastic to be bishop, metropolitan, primate, or patriarch of the ancient see (see IN PARTIBUS INFIDELIUM). In England, and still more in Ireland, where archbishops and bishops of the Roman Catholic Church exist *de facto*, but not *de jure*, they are styled titular.

TI'TUS, EPISTLE TO, one of the three 'Pastoral Epistles,' was written by St. Paul, probably in the latter part of his life, and after he had been liberated from his first imprisonment at Rome. From the 12th verse of chapter iii., we learn that the apostle was staying at Nicopolis when he wrote the letter, and the subscription identifies this place with Nicopolis of Macedonia; but this is impossible, for, as De Wette notices, that city appears to have been founded by the Emperor Trajan long after St. Paul was

dead. Jerome's opinion is probably the correct one, that the Nicopolis referred to was the famous city in Epirus. The Epistle concerns itself mainly with the organization and discipline of the church in Crete, is very practical, and at times unpleasantly sharp in its tone, as if Paul had felt more acutely than usual the vexations which 'unruly and vain talkers and deceivers, *specially they of the circumsion*,' caused him. Above all things, however, he is solicitous that the Christians of Crete should shun the immoral practices of heathenism.—From the days of Eichhorn, the Pauline authorship of this and the other Pastoral Epistles has been disputed on the ground of their differing from Paul's Epistles not merely in style but in doctrine. See Bauer's *Die So-genannten Pastoral-briefe des Apostels Paulus*.

TITUS FLAVIUS SABINUS VESPASIANUS, emperor of Rome, was the eldest son of Vespasianus (q. v.) and Flavia Domitilla, and was born at Rome 30th December 40 A.D. Brought up at the court of Nero along with Britannicus, the son of the Emperor Claudius, he received an excellent training both of body and mind, became an adept in manly exercises, and an accomplished scholar; and subsequently, as *tribunus militum* in Germany and Britain, and commander of a legion in Judæa under his father, proved his qualities as a soldier and a general. On his father's elevation to the imperial throne, T. was left to prosecute the Jewish war, which he brought to a close by the capture of Jerusalem after a long siege. The news of the success was received with the utmost joy, and Vespasian's too suspicious temper was awakened. However, T., by returning to Rome, and laying the trophies of victory at the emperor's feet, removed his unfounded jealousy, and father and son obtained the honor of a joint triumph (71 A.D.).

About this time T. became his father's colleague in the empire, and the impression which the conduct of the young conqueror made upon the Roman people was, and with just reason, very unfavorable. He gave himself up to the pursuit of pleasure in all its forms, put to death various suspected persons very summarily, and even caused one of his guests, whom he justly suspected of conspiracy, to be assassinated as he left the palace. His *liaison* with Berenice, the daughter of Herod Agrippa I. (q. v.), was also very distasteful to the Romans; and on the death of his father (79 A.D.), whom he was at that time believed by a few to have poisoned, the Romans had satisfied themselves as to the advent of a second Nero. But T.'s behavior after his hand grasped an undivided sceptre completely belied their anticipations. The very first act of his reign was to put a stop to all prosecutions for *læsa majestas*, which had abounded since the time of Tiberius (q. v.); informers were scourged in the forum, dragged along in front of the theaters, and then either sold as slaves or banished. The ancient and venerated buildings of Rome were repaired; new ones, as the Colosseum (see AMPHITHEATER) and the baths which bear his name, were erected; and the prominent tastes of the populace were abundantly gratified by games on the most stupendous scale, which lasted for 100 days. T.'s beneficence was unbounded, and it so happened that during his brief reign there was the most urgent need of its exercise. In 79 A.D. occurred the great eruption of Vesuvius, which overwhelmed Herculaneum and Pompeii, and ruined numerous other towns and villages; in 80 A.D. a fire broke out in Rome, which raged for three days, destroying the Capitol, Augustus's library, Pompey's theater, and numerous houses; and in the tracts of these calamities followed a dreadful pestilence. T. dealt out gifts with lavish hand to the houseless and ruined sufferers; he even despoiled his palaces of their valuable ornaments to obtain money for distribution, and schemed and planned to furnish occupation for them. He was now the idol of his subjects, the 'love and delight of the human race;' but unfortunately for that part of the human race over which he ruled, in the commencement of the third year of his reign, he became suddenly ill, and died at his patrimonial villa in the Sabine country (September 13, 81), not without the suspicion that he had been poisoned by Domitian, his younger brother.

TIUME'N, a town of West Siberia, in the government of Tobolsk, stands on the Toura, an affluent of the Ob (q. v.). Its advantageous situation on the highways, both by land and water, which communicate between Russia and Siberia, has made it an important commercial center, and the seat of flourishing manufactures. The vessels which navigate the Ob, the Irtish, the Tobol, and the Toura, for the most part receive their cargoes here. Large quantities of leather, leather-goods, carpets, soap, candles, and common pottery are manufactured and exported throughout W. Siberia, the Ural countries, the Kirghis Steppes, Khokan, Bokhara, and China. Pop. (1880) 15,212.

TI'VERTON, a municipal and parliamentary borough in the north-east of Devonshire, 14 miles north of Exeter. There are important weekly markets, and four great markets for cattle annually. There is a large lace-factory, in which upwards of 1000 hands are employed. The town is built on a hill between the rivers Exe and Lowman; hence the old names of the town, TWYFORD and TWOFORD-TOWN. The streets in many places are very narrow, but clean. A new town-hall was erected in 1864, and an Athenæum has been recently founded. There is a peculiarity about the town in the rapid streams of water flowing down the channels along the sides of the streets. These streams of water were given to the town about the year 1272, by Isabella Rivers, Countess of Devon. The castle was built in 1106. The free grammar-school, an old building in the Elizabethan style, was endowed by Mr. Peter Blundell in 1604. In connection with the school there is a scholarship at Balliol College, Oxford, and another at Sydney Sussex College, Cambridge, each of the annual value of not less than £60. There are four exhibitions, of £30 per annum each, for four years, at any college in either university; one exhibition of £50 a year, for seven years, at Balliol College; and one of £25. There are other schools and numerous charities. T. sends two members to the House of Commons. Pop. (1871) 10,025; (1881) 10,462.

TI'VOLI (anc. *Tibur*), a poor town of Central Italy, province of Rome, 18 miles east from Rome, stands on the slope of Monte Ripoli, one of the Apennines. T. is walled, and has a fortress. The streets are steep, narrow, and beset by beggars. There is a fine cathedral, formerly a temple of Hercules, where Augustus held his tribunal. The surrounding hills are covered with olive trees. The vines of T. are famed for a peculiar sort of grape, in great request for its firmness and luscious flavor, noticed as early as the time of Pliny the Elder. The stone called 'travertino,' of which great part of Rome is built, comes from Tivoli. Pop. 8000. Near T. is the extensive Villa d'Este. Within and without the city, there are many monuments of antiquity. In a commanding position above the falls of the Anio, rises the Temple of Vesta, of a circular form, and in good preservation, built 70 B.C.; there are the extensive remains of the Emperor Hadrian's magnificent villa; the villa of Mæcenas; remains of mausoleums, aqueducts, baths, &c. The place is much visited by tourists for its waterfalls, which are lofty, but not very picturesque.

Tibur long existed as a town (according to ancient tradition) before the building of Rome; but the first mention of it in recorded history occurs 446 B.C., during the Roman decemvirate. It was one of the principal towns of the Latin confederation. Its healthy and picturesque situation induced many of the wealthy Romans to choose it for their country residences. Mæcenas, Scipio, Æmilianus, the famous Marius, Metellus Numidicus, and Munatius Plancus, had their Tiburtine villas. Horace preferred Tibur to all other places of resort (although he makes allusion to its moist atmosphere, calling it 'Udum Tibur'), and had a country-house in the neighborhood. It is one of the few towns of Latium which still stand on their ancient sites.

TLEMCEN', a town of Algeria, capital of the province of Oran, and 80 miles south-west of the city of that name, stands in an undulating country, everywhere irrigated, and brought completely under cultivation. It contains Catholic and Protestant churches, mosques, and synagogues, and there are numerous educational institutions, including schools for Arabs and Jews. It is protected from the south wind by a range of hills, 4200 feet in height. The town is accessible only from the south-west, the other sides presenting steeply escarped fronts. The district around T. is covered with fruit-trees of all kinds, of which the olive is one of the most valuable, and there is much cultivated land, producing cereals, tobacco, &c. Besides the special markets, a daily market is held, at which cattle, wool, grain, and oils are largely sold. Ostrich feathers and corks are exported; but the trade is for the most part in cloths, hides, grain, and oils. Pop. about 22,000.

TOAD (*Bufo*), a genus of *Batrachia*, of the *Anourous* or tailless section of the *Caducibranchiata*. See BATRACHIA. The original genus has been subdivided, and is now constituted into a family, *Bufonidæ*, to all which the popular name T. is often extended. The form resembles that of the frogs, but is more thick and clumsy, and the hind-legs are generally short, so that the species rather crawl than leap; some of them, indeed, are not known to leap at all. The skin is warty, and the warts or tubercles produce a milky exudation, which in some species is very fetid. Behind the ear there is a porous pad—a very large parotid gland—from which a copious exudation takes place. The muzzle in the restricted genus *Bufo* is rounded, but some of the family have an elongated muzzle. The mouth of the true toads is destitute of teeth. The food of toads consists chiefly of small insects and slugs, and they mostly inhabit shady places, avoiding the sunshine, and crawling about either amongst the stems and leaves of plants or amongst stones. In their adult state, they are much less aquatic than frogs, but their spawn is deposited in water, in which their tadpoles live like those of frogs. They are commonly regarded with disgust, on account of their appearance, the exudation from the skin, and the smell of many of them, yet the eye of the T. is remarkably beautiful.

A notion has very generally prevailed that the exudation of the

skin is venomous, but it is unsupported by evidence, and toads are handled with perfect impunity. They are eaten by some savage tribes.—Only two species are British. The COMMON T. (*B. vulgaris*) is abundant in most parts of Britain, and in the western parts of Europe, but is not found in Ireland. A description of it is unnecessary. It spends the winter in a dormant state, and issues from its retreat on the return of spring. Its spawn is deposited in March or April, and much resembles that of the frog, but the ova are smaller and more numerous. The young T. is very small when it loses its tail and gills, and exchanges the tadpole for the adult form. Toads are very useful in gardens, in preventing the excessive increase of some kinds of insects; and on this account, it is a frequent practice to put them into hotbed frames for which use the market-gardeners of the neighborhood of London often purchase them at the price of fourpence each. They have occasionally been tamed, and display some intelligence, readily recognizing those who feed them and are kind to them. A tame T., of which an account is given by Pennant in his *British Zoology*, lived for more than forty years, and was at last killed by a raven.

Numerous instances are on record in which toads are said to have been found embedded in rocks, walls, and even in the trunks of trees, where the necessary conclusion is that they must have lived a very long time, in a dormant state. Unfortunately, however, the discovery of these toads has almost always been made by unscientific persons, and there is a want of proper and trustworthy observations as to the places in which they have been found. Attempts have been made by several naturalists, and among others by the late Dr. Buckland, to throw light on the subject by experiment, immuring toads in various ways, and the result, although showing that when air is not wholly excluded, they are capable of living for a long time in their imprisonment, probably in a dormant state, is not favorable to the belief that such existence could extend over many years. An interesting account of Dr. Buckland's experiments will be found in Mr. F. Buckland's *Curiosities of Natural History*.

The other British species of T. is the NATTERJACK (*B. calamita*), which was first described as British by Pennant, and has since been found to be pretty abundant in some parts of England,

1, Common Toad (*Bufo vulgaris*); 2, Natterjack (*Bufo calamita*).

and in the south-west of Ireland, chiefly in the vicinity of the sea. It much resembles the common T., but is of a yellowish-brown color, clouded with dull olive, a bright yellow line passing along the middle of the back. It has a disgusting smell. It never hops, and its motion is more like walking or running than the crawling of the common toad.—Several other species of T. are found in Europe. Some of those found in tropical countries attain a very large size, and exhibit protuberances of various kinds, far exceeding even in proportion the warty excrescences of the common toad.

TOADFLAX (*Linaria*), a genus of plants of the natural order *Scrophularineæ*, very closely allied to SNAPDRAGON (q. v.), from which genus this has but recently been separated, and is distinguished chiefly by the spur at the base of the corolla, and the capsule opening by valves or teeth, not by pores.—The species are herbaceous plants, natives chiefly of the colder and temperate parts of the Old World. Some of them are natives of Britain, of which the most common is *L. vulgaris*, a species with erect stem of 1—3 feet high, glaucous linear-lanceolate leaves which thickly cover the stem, and terminal spikes of yellow flowers. It grows in hedges, the borders of cornfields, &c. It possesses purgative and diuretic properties, and a decoction of it is used as a fly-poison; but it is regarded as a troublesome weed by farmers. It has found its way, probably along with grain or other grass seeds, into the United States. A very remarkable monstrosity is sometimes seen in this plant, to which the name *Peloria* has been given, the flower presenting five spurs, and five usually imperfect stamens.—*L. Cymbalaria*, a pretty little plant with trailing stems and 5-lobed cordate leaves, is often planted to cover old walls, &c., and is either a native of Britain, or naturalized in many places.

TOADSTONE, a local Derbyshire name for a soft and earthy variety of trap, looking like an argillaceous deposit.

TOAST (Lat. *tostus*, scorched or roasted) is the name given to bread dried or scorched before the fire. So early as the 16th c., toasted bread formed a favorite addition to English drinks. Sack was drunk with toast, and so was punch. The practice of drinking healths, particularly that of an entertainer, is one so natural, so likely to spring up spontaneously, that it is impossible to say when it began. Certain it is, however, that it received an artificial development owing to the prevalence of convivial habits in the 17th century. Then it became the fashion to drink not to the health of entertainers only, but to that of each guest, of absent friends, and more especially of the unmarried woman whose attractions were most generally acknowledged. It also became the custom to describe a woman whose health was so drunk as herself 'a toast.' In this sense, the application of the word is said to have had its origin in an incident which occurred at Bath, and which is recorded in the 24th number of the *Rambler*, in the following passage: 'It happened that on a public day, a celebrated beauty of these times' (when it was the fashion for ladies to bathe publicly in elegant dresses made for the purpose) 'was in the Cross Bath, and one of the crowd of her admirers took a glass of the water in which the fair one stood, and drank her health to the company. There was in the place a gay fellow, half fuddled, who offered to jump in, and swore, though he liked not the liquor, he would have the 'toast' (making, of course, allusion to the custom of putting toast in punch). 'He was opposed in his resolution; yet this whim gave foundation to the present honor which is done to the lady we mention in our liquor, who has ever since been called a toast.' Whatever may be the origin of the use of the word 'toast' in this sense, we now apply it not only to any person, but to any sentiment mentioned with honor before drinking. The French have adopted the word from us; making it masculine when applied to a man or a sentiment, but feminine when to a woman. See Chambers's *Book of Days;* Valpy's *History of Toasting* (1881).

TOBA'CCO (of uncertain derivation, but most probably from the native American name), a genus (*Nicotiana*) of plants of the natural order *Solanaceæ*, having large broad leaves; a 5-parted calyx; a funnel-shaped, 5-lobed corolla, and five stamens; the flowers growing in panicles at the top of the stem; the fruit a 2-celled, 5-valved, many-seeded capsule. The species are mostly herbaceous plants, rarely shrubby, with large broad leaves, and everywhere covered with clammy hairs. They are natives of warm countries, most of them American, although some are found in the East Indies. They all possess the narcotic property, on account of which a few of them are extensively cultivated. It resides in almost all parts of the plant, although the leaves are almost exclusively used. The most important species is the COMMON T., or VIRGINIAN T. (*N. tabacum*), a native of the warm parts of America, the cultivation of which had extended before the discovery of the New World by Columbus, far to the north of the regions in which the plant appears to be indigenous. It is about 5 or 6 feet high, erect, with lanceolate, sessile leaves, 6—18 inches long, and rose-colored flowers, the throat of the corolla inflated, the segments pointed. There are numerous varieties, differing more or less in the size and form of the leaves, and in the form and color of the flowers, some of which are regarded by some botanists as distinct species. One of these is the BROAD-LEAVED T., or MARYLAND T., which has a thicker stem, and much broader leaves. The GREEN T. (*N. rustica*), sometimes called ENGLISH T., because it was the first kind introduced into England for cultivation, is a smaller plant, from 3 to 5 feet high, with ovate, stalked leaves, and the segments of the corolla rounded, its tube cylindrical. It is a native of the East, but is more hardy than the Virginian T., and is therefore cultivated in more northern regions. The PERSIAN T. (*N. Persica*) has the root-leaves oblong, those of the stem lanceolate and sessile; the corolla salver-shaped, with a long tube; its lobes rather unequal. It is a native of Persia, and furnishes the Shiraz T., so much esteemed in the East, and which is milder than the common tobacco. Other species of T. are used in different parts of America, and some of them are cultivated to a small extent, as *N. repanda*, in Cuba; *N. quadrivalvis*, by the Indians on the Missouri; *N. multivalvis*, by the Indians on the Columbia; and *N. nana*, by the Indians of the Rocky Mountains.

It is somewhat doubtful whether the use of T. as a narcotic was known in the East before the discovery of America. Meyen,

in his *Geography of Plants*, expresses the opinion that the smoking of T. is of great antiquity amongst the Chinese, because on very old sculptures he has 'observed the very same tobacco-pipes which are now in use.' Meyen's authority, however, is greater as a botanist, than as an archæologist, and cannot be received as decisive of the antiquity of the sculptures of which he speaks. It is not improbable that the smoking of T. has been long practised in China, but it is not certain. If it was so, the custom did not extend amongst neighboring nations, which, however, has been the case also as to the use of some other narcotics; whereas, on the introduction of the use of T. from America, it

Virginian Tobacco. (*Nicotiana tabacum*).

Green Tobacco. (*Nicotiana rustica*).

rapidly extended throughout Europe, and soon became extremely prevalent amongst Oriental nations. In the present state of our knowledge, no ethnological argument can be founded upon the prevalence of smoking amongst the Mongolians and the American Indians. The smoking of T. was found by Columbus to be practised in the West Indies, where the natives made it into cylindrical rolls, wrapped in maize-leaf. It has been prevalent from unknown antiquity amongst the American Indians as far north as Canada. With them it even has a religious character, and is connected with their worship and with all their important transactions. Thus, the Calumet (q. v.), or pipe of peace, is indispensable to the ratification of a treaty, and smoking together has even greater significance of friendship than eating together has amongst other nations. 'In the belief of the ancient worshipers, the Great Spirit smelled a sweet savor as the smoke of the sacred plant ascended to the heavens; and the homely implement of modern luxury was in their hands a sacred censer, from which the hallowed vapor rose with as fitting propitiatory odors as that which perfumes the awful precincts of the cathedral altar, amid the mysteries of the church's high and holy days.'—Wilson's *Prehistoric Man*, i. 383. The seeds of the T. plant were first brought to Europe by Gonzalo Hernandez de Oviedo, who introduced it into Spain, where it was first cultivated as an ornamental plant, till Nicolo Menardes extolled it as possessed of medicinal virtues. It was introduced into Italy in 1560.

The use of T. in the form of snuff soon followed its introduction for smoking, There is no reference to the use of T. in Shakspeare, yet it is certain from other evidence that it was well known in England in his time, although at first its use was confined to the wealthy, as the price was very high, and it was smoked in very small pipes—probably the same which are known to antiquaries as *Elfin Pipes*—and the smoke was expelled, not from the mouth, but by the nostrils, in which way the narcotic power of the herb is much greater. T. was at first recommended for medicinal virtues, which were greatly exaggerated, but soon became an article of luxury. The popes Urban VIII. and Innocent XI. fulminated against it the thunders of the church; the priests and sultans of Turkey declared smoking a crime, Sultan Amuret IV. decreeing its punishment by the most cruel kinds of death; the pipes of smokers were thrust through their noses in Turkey; and in Russia, the noses of smokers were cut off in the earlier part of the 17th century. King James I. of England issued a *Counterblaste to Tobacco*, in which he described its use as 'a custom loathsome to the eye, hateful to the nose, harmful to the brain, dangerous to the lungs, and in the black, stinking fume thereof nearest resembling the horrible Stygian smoke of the pit that is bottomless.' All opposition, however, was in vain. The use of T. increased, and has continued to increase to the present day, when it is more prevalent than at any former time, the luxury of rich and poor, of civilized nations and of savage tribes. Although it did not become prevalent in the East till the 17th c., the Turks and Persians are now the greatest smokers in the world; in India, all classes and both sexes smoke; in China, the practice—perhaps there more ancient—is universal, and girls, from the age of eight or nine, wear, as an appendage to their dress, a small silken pocket to hold tobacco and a pipe.

How the practice of smoking has increased in Britain, every one knows. The use of snuff has not increased in the same manner, but has rather diminished. T. is used in the three modes of smoking, chewing, and snuffing. Plugging, the stuffing of the nostrils with quids of T., has been almost universally discontinued, although at one time it was practised to a small extent. In Britain, chewing is now chiefly practised by sailors, smoking being prohibited or restricted at sea, on account of the danger of fire; but it is very prevalent in some parts of the world, particularly in North America. The smoking of T. is everywhere more or less social, like the use of wine; and the snuff-box is handed from one to another in token of good-fellowship.

T. derives its botanical name (*Nicotiana*) from Jean Nicot, who introduced it into France. In that country, its use in the form of snuff began in the reign of Francis II. About the same time, a snuff-manufactory was established at Seville, which produced the celebrated Spanish snuff. The T. plant was soon after introduced into other countries of Europe. In 1657, the manufacture and sale of T. were farmed out in Venice, and began to yield a considerable revenue. Much revenue has since been derived from the same source, in many countries. T. is now extensively cultivated in many parts of Europe, as well as in Asia and America. Prohibitory laws alone prevent its cultivation in the southern parts of Britain and Ireland, of which the climate is quite suitable to it. The quality of the leaf, however, deteriorates in the more northern regions in which it is cultivated, as in Germany, when it is continuously raised from home-grown seed, and seed is therefore imported from warmer countries.

Cultivation and Commerce.—The cultivation of T. requires a rich loose soil, and the strongest manures are advantageous. The influence of soil, climate, and manures on the quality of the produce is very great, almost beyond what is known in any other cultivated plant. Vegetable manures are best for T. intended for smoking; animal manures are preferred for that which is to be made into snuff. In the more northern regions in which T. is cultivated, the seed is sown in a hot-bed, protected from frost by mats, and the plants are planted out in rows from two feet to three feet apart in the field. The ground is frequently hoed and stirred. Where the plants are not intended for seed, the top is usually broken off, so as to prevent flowering, that its whole strength may be directed to the leaves. In America, when the leaves begin to become yellow, or are marked with yellow blotches, the plants are cut down, and hung up in a large barn to dry; but in Germany, the leaves are gathered as they become yellow, are tied in small bunches, and are hung up in a shady place to dry.

The cultivation of T. is comparatively easy, and although a warm climate suits it best, it is without much difficulty raised in most parts of Europe. The usual plan in the great tobacco-producing countries is to sow the seed in seed-beds of rich soil, and as the seed is extremely minute, it is first mixed largely with sand or wood-ashes, to assist in spreading it thinly. In Virginia, which may be taken as one of the best tobacco-growing districts, this is usually done in the first week in January. After the seed-beds have been carefully prepared and sown, small branches of trees are laid over, to protect the seed, when it germinates, from the effects of frost; but these are removed as soon as can be done with safety, and the plants then grow rapidly, and are ready for transplanting into the fields about the beginning of June.

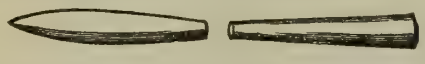
The land in the fields is very carefully prepared, and small hillocks are raised up in rows; each is about a foot in diameter, and flattened at the top. With the first appearance of rain, the plants are carefully raised from the seed-beds, and carried usually by children, who deposit one on each hillock, on which it is carefully planted by experienced men, who follow after the children. Only wet weather will do for planting, so that this operation often lasts until the end of July. When planted, the tobacco-crop requires much careful attention to weeding, and a watchful eye to prevent the ravages of various insect enemies. Much of this latter work is done by flocks of turkeys, kept on purpose by the planters. As soon as the plants begin to throw up the flower-shoot, it is nipped off; otherwise it would weaken the leaves; but this process is neglected in some countries, especially in Turkey and Greece, where small leaves are preferred, and where, in some cases, as in the celebrated Latakia tobacco, both leaves, buds, and flowers are used. The time generally chosen for cutting it is mid-day, or when the sun is powerful, and the morning and evening dews absent. The cutting is done by hand, and only such plants are chosen as are ready, which is known by a clammy exu-

dation which forms over the leaf, often giving it a spotted appearance. If the plants are very large, the stalk is often split down, to facilitate the drying. They are then removed from the field to the tobacco-house, around which are erected light scaffolds, to which the plants are suspended, generally by passing a thin stick through a split in the stalk of each, and so placing a number of plants on each stick, just near enough to prevent them touching each other. After some time hanging in the open air, the plants on the sticks are removed, and suspended in a similar way inside the curing-house, until the drying is completed. The leaves are next removed from the stalks, and all bad ones rejected. The chosen ones are tied up in bundles called hands, and these are packed in hogsheads, enormous pressure being applied in the packing. These hogsheads are very large casks, which must not contain less than 950 lbs. net in the United States, where the government exercises a very strict surveillance over the weight and quality of all tobacco grown and cured there.

Previously to the late disastrous war with Brazil, a large tobacco-export had been carried on by Paraguay. The quality, though not equal to that grown in the United States, was, however, fair, and had been improving. Turkey has also, for several years past, been steadily increasing her exports of tobacco to Great Britain. The quality of Turkish tobacco is very peculiar: it is small in the leaf, and of a light color—either a bright yellow, a yellowish green, or a yellowish brown. Being extremely mild, it is a favorite with many smokers.

Tobacco, owing to the high rate of duty when in any manufactured form, is mostly imported in the leaf; but small quantities are brought in, chiefly for re-export, in various states of manufacture. The chief of these is called Cavendish, which is made by stripping the blades of the leaves from the midribs, and after sprinkling them with an infusion of tobacco made from the stalks and other waste parts, laying them in heaps to heat or ferment. This darkens their color; and whilst still moist and flaccid, they are laid smoothly upon each other, so as to form cakes about nine inches in length by three in breadth, which are pressed by powerful machinery until they are very compact and hard. Another kind is called Negrohead, which is formed into sticks about an inch thick, and eight or nine in length, which are laid across each other equally, and are then pressed into cakes. When the sticks are pulled apart, the rounded depressions caused by pressing them into one another gives them a slight resemblance to the wavy locks of a negro's hair, whence they receive their name. The leaf simply twisted into a rope, as in the kind called Varinas Roll and other similar sorts, as well as that which is merely cut small for smoking, is all held to be 'manufactured,' and charged with the highest duty, so that very little indeed is imported.

Cigars and *Cheroots* are also forms of manufactured tobacco; but so much in favor are these with smokers, that the exorbitant duty is very little check upon their importation. The island of Cuba supplies not only the best but also the largest quantity, the Havana tobacco being exceedingly well cultivated and cared for, and being especially well adapted for cigar-making. More than half of all the cigars imported into Great Britain are from Cuba; and the cheroots are chiefly from Manilla. The Philippine Islands also send us about 100,000 lbs. per annum of cigars, and other countries about 1,300,000 lbs. The total amount sent to Great Britain in 1880 was 1,472,116 lbs., equal in value to about £1,008,841. Cigars and cheroots are essentially the same; they only differ in form, as represented in the diagrams.



Cigar. Cheroot.

The tobacco received in the leaf is all more or less manufactured in this country. It is either cut finely, so as to be convenient for use in pipes, or made into Cavendish, Negrohead, or Twist; the last is often called *Pig-tail;* and is a continuous string of tobacco about the thickness of a quill, many yards in length, made by twisting and spinning the leaves when flaccid from being wetted and heated as before described; this string is then made up into balls, and is the kind chiefly used by those who chew tobacco.

Snuff is another form of manufactured tobacco largely made in Great Britain. It is formed by grinding the leaf either with or without the leafstalks and midribs. The grinding is generally effected in wooden mortars, with pestles also of wood; and some kinds of snuff are prepared from kiln-dried tobacco, whilst others are made from the soft leaves. The varieties are numerous, and fortunes have been made by manufacturers who have been fortunate enough to make a snuff which has become a favorite.

Tobacco is subject to a higher rate of duty, in proportion to its intrinsic value, than any other article. The value of the best sorts in the leaf only ranges from 3*d.* to 9*d.* per pound; whilst the duty is as follows: Unmanufactured, containing 10 per cent. or more of natural moisture, 3*s.* 6*d.* per pound; and if containing less than 10 per cent. of moisture, 3*s.* 10*d.* per pound. The various kinds of manufactured tobacco range from 4*s.* 1*d.* to 5*s.* 6*d.* per pound. In consequence of this disproportion between the value of the material and the duty paid upon it, its importation is fettered with numerous conditions, which should be well understood by those who import either for trade or for private use. The chief regulations are as follows: It is prohibited to be imported at any other ports in the United Kingdom than Aberdeen, Belfast, Cork, Cowes, Drogheda, Dublin, Falmouth, Fleetwood, Galway, Glasgow, Greenock, Hartlepool, Hull, Lancaster, Leith, Limerick, Liverpool, London, Londonderry, Newcastle, Newry, Plymouth, Port-Glasgow, Portsmouth, Preston, Sligo, Southampton, Swansea, Waterford, Wexford, and Whitehaven; or in original packages of less than 80 pounds weight. This does not apply to the small quantities which passengers may wish to bring with them in their baggage; in which case they may pay duty on any quantity of manufactured tobacco or cigars under 3 pounds, if from the continent (except in the case of frequent visitors), and any quantity not exceeding 7 pounds if from the East and West Indies, and other distant voyages; and of unmanufactured tobacco, passengers may pay duty, and import as surplus stores any quantity not exceeding 9 pounds. Of cigars unconsumed on the passage, the passenger is only allowed 8 ounces free of duty. The penalties for any evasion of these regulations are very heavy, in addition to which the goods are always forfeited to the crown.

The quantity of manufactured tobacco, that is, cigars, cigarettes, and cavendish, which was imported into the United Kingdom in 1880 was 3,502,466 lbs., and its value £1,130,235; of unmanufactured, 59,571,973 lbs., and its value £1,746,919. The gross amount of revenue collected by the Custom House, for tobacco and snuff, in 1880–81, after deducting repayments and drawbacks, was £8,658,947. The revenue from this article has upon the whole kept steadily increasing for a considerable number of years. It had prior to that been greatly affected by the civil war in America. The smallest value of manufactured tobacco between 1857 and 1876 was imported in 1859; of unmanufactured, during the same period, the smallest value was imported the following year.

Tobacco is used as a sedative or narcotic over a larger area, and amongst a greater number of people than any similar substance, opium being the next to it in these respects, and the hemp-plant the third. Tobacco-leaves, when submitted to chemical analysis, yield Nicotine (q. v.), which is its most characteristic constituent, albumen, a gluten-like substance, gum, resin, malic and citric acids, and a large amount of inorganic constituents, 100 parts of the dry leaf yielding from about 19 to 27 per cent of ash, in which potash, lime, and silica preponderate. In a physiological and medical point of view, the analysis of the smoke of tobacco is of far more importance than that of the leaf. From the researches of Dr. Richardson, it appears that although 'the widest differences prevail in respect to the products arising from differing cigars, differing kinds of tobacco, and differing pipes,' there are certain substances which are common to all varieties of tobacco-smoke. Firstly, there is in all tobacco-smoke a certain amount of *watery vapor*, impregnated with various substances, from which it may be separated. Secondly, a small quantity of free *carbon* is always present; it is to the presence of this constituent that the blue color of the smoke is due.

'It is this carbon,' says Dr. Richardson, 'which in confirmed and inveterate smokers settles on the back part of the throat, and on the lining membrane of the bronchial tubes, creating often a copious secretion, which it discolors, and which is coughed up of a dark coaly appearance.'—*For and Against Tobacco*, Lond. 1865, p. 5. Thirdly, there is a certain quantity of *ammonia* present. The presence of the ammonia gives to the smoke an alkaline reaction. Moreover, 'it is the ammonia that bites the tongue after long smoking; it is the ammonia that makes the tongue and throat of the smoker so dry, and induces him to quaff as he smokes, and that partly excites the salivary glands to secrete so freely. The ammonia also exerts an influence on the blood.' Richardson, *op. cit.*, p. 6. Fourthly, *carbonic acid* is always present, as may be shown by its action on lime-water. The amount differs extremely in the smoke from different kinds of tobacco, but, according to Dr. Richardson, it may be fairly inferred that the sleepiness, headache, and lassitude which follow the prolonged inhalation of tobacco-fumes, are largely due to this agent. Fifthly, tobacco-smoke yields a *product having an oily appearance*, and possessing poisonous properties. It is popularly known as *oil of tobacco;* and on further analysis, it is found to contain three substances—viz., a fluid alkaloid, *nicotine;* a *volatile substance* having an empyreumatic odor; and an *extract* of a dark resinous character, having a bitter taste. The symptoms of tremor, palpitation, and paralysis which ensue after excessive smoking, especially in persons unaccustomed to indulgence in this practice seem to depend upon the nicotine, which is known by experiment to be highly poisonous.

'The peculiar smell of stale tobacco-smoke, which hangs so long on the breath of the smoker, and on articles of clothing, is derived from the volatile empyreumatic substance; and the exceedingly nauseous sharp taste which is recognized by every unpractised smoker, when he takes a foul pipe into his mouth, is due to the bitter extract. It is apparently this extract which creates vomiting in persons unaccustomed to tobacco, and of which the body after a time becomes tolerant.'—Richardson, *op. cit.*, p. 8. Hence it appears that the more common effects are due to the carbonic acid and the ammonia; while the rarer and more severe are due to the nicotine, the empyreumatic substance, and the resin.

It is unnecessary to enter into details regarding the symptoms of slight tobacco-poisoning, because they are well known to the great majority of the male population. Fortunately, the effects produced by tobacco are very transitory, as the poison finds a ready exit from the body. The system, after being subjected for a few times to the poisons of tobacco-smoke, becomes accustomed to their influence, the distressing symptoms no longer occur, and a condition of 'tolerance' is established. From the extensive investigations of Dr. Richardson, it appears that there are no grounds for believing that smoking can produce any organic changes. It may, however, produce various functional disturbances: (*a*) On the stomach. (*b*) On the heart, producing debility and irregular action. (*c*) On the organs of the senses, as dilitation of the pupil, confusion of vision, subjective sounds, &c. (*d*) On the brain, suspending the waste of that organ, and oppressing it if it be duly nourished, but soothing it if it be exhausted. (*e*) On the nerves, leading to over-secretion of the glands which they control. (*f*) On the mucous membrane of the mouth, causing what has been described as the 'smoker's sore throat.'

'The disease consists of an irritable state of the mucous membrane at the back of the throat, redness there, dryness, a tendency to cough, and an enlarged soft, sore condition of the tonsils, rendering every act of swallowing painful and difficult.' It may exist without detection for a long time; but if a damp, cold, foggy state of the air comes on, the throat becomes troublesome and painful, enlargement of the tonsils is detected, and the symptoms become much aggravated by any attempt to smoke. This condition is more readily induced by the use of cigars than of pipes; it is quite incurable so long as the patient continues to smoke, but soon disappears when the use of tobacco is entirely suspended. In association with this condition of the throat, the gums are usually abnormally pale and firm. (*g*) On the bronchial surface of the lungs, sustaining any irritation that may be present, and increasing the cough. There is no evidence that tobacco-smoke can cause specific diseases, such as insanity, epilepsy, St. Vitus's dance, apoplexy, organic disease of the heart, cancer, consumption, or chronic bronchitis. If, as is universally allowed, tobacco possesses, like alcohol, arsenic (in minute doses), opium, tea, coffee, &c., the power of arresting the oxidation of the living tissues, and thus checking their disintegration, it follows (1) that the habit of smoking must be 'most deleterious to the young, causing in them impairment of growth, premature manhood, and physical degradation' (Richardson, *op. cit.*, p. 73); and (2) that the habit may be conducive to the physical well-being of the individual, provided he cannot supply himself with sufficient nourishing food to supply the daily tear and wear of the muscular and nervous systems.

For a long controversy on the question, *Is Smoking Injurious to Health?* in which Sir Ranald Martin, Mr. Solly, Dr. Ranking, and other medical men took a part, the reader is referred to the 1st volume of *The Lancet* for 1857. The whole matter is very fairly summed up by Dr. Richardson in the excellent pamphlet from which we have so freely borrowed in this article—a memoir which we can cordially recommend to all who take an interest in this subject. Before the full maturity of the system is attained, even the smallest amount of smoking is hurtful; subsequently, the habit is, in most instances, only prejudicial when it is carried to excess. We cannot honestly say more against tobacco than can be urged against any other luxury, and of nearly every luxury it is the least injurious. 'It is innocuous as compared with alcohol; it does infinitely less harm than opium; it is in no sense worse than tea; and by the side of high living altogether, it contrasts most favorably.'—Richardson, *op. cit.*, p. 75. In conclusion, a word or two may be said regarding the kind of pipe that should be used. A long, perfectly clean pipe, composed of an absorbing material like clay or meerschaum, which can suck up the oily matter before it reaches the mouth, is always to be preferred; and M. Melsens, to whom the scientific world is indebted for many ingenious applications of chemistry to hygiene and the treatment of diseases, has recently suggested, that if a plug of cotton, saturated with a strong solution of citric or tannic acid, were placed in the stem, so as to filter the smoke before it reached the mouth, all the nicotine would be seized by and combine with the acid. The different kinds of tobacco exert a different influence on the smoker according to the amount of noxious ingredients which they contain. Thus, cavendish, pigtail, and coarse shag yield the oily matters in much more abundance than Latakia or Turkish, which are hence termed mild tobaccos. Cigars produce dyspepsia much more rapidly than pipes, for in smoking them, unless with a long mouth-piece, nicotine is necessarily absorbed.

Snuffing is probably the least injurious form in which to take tobacco, and chewing the most deleterious; yet sailors, who chew more freely than any other class in this country, are usually men in vigorous health, and after prolonged practice, the quantity they can consume is enormous. Dr. Arrott mentions the case of a harbor-superintendent, formerly a sailor, aged 64, in the almost uninterrupted enjoyment of good health, who chewed tobacco for upwards of 50 years, and at length *ate* it, swallowing every particle of leaf and juice. For many years, he had been in the constant practice of 'eating a quarter of a pound of the strongest negrohead every five days.'—*The Lancet*, 1847, vol. i. p. 440.

The effects which tobacco produces in large doses, when taken by persons unaccustomed to its use, in the form of powder, infusion, or excessive smoking, are 'faintness, nausea, vomiting, giddiness, delirium, loss of power of the limbs, general relaxation of the muscular system, trembling, complete prostration of strength, coldness of the surface, with cold, clammy perspiration, convulsive movements, paralysis, and death. In some cases, there is purging, with violent pain in the abdomen; in others, there is rather a sense of sinking or depression in the region of the heart, creating a sense of impending dissolution. With the above-mentioned symptoms, there is a dilatation of the pupils, dimness of the sight, a small, weak, and scarcely perceptible pulse, and difficulty of breathing.'—Taylor's *Principles and Practice of Medical Jurisprudence*, p. 321. Although thre are two recorded cases of poisoning by nicotine, poisoning by tobacco has rarely given rise to medico-legal investigation. There is, however, reason to believe that porter is often drugged with tobacco or Scotch snuff, for the purpose of stupefying persons with a view to robbery. In all cases of poisoning with tobacco, if it has been swallowed, an emetic of a scruple of sulphate of zinc should be at once administered, and the most powerful stimulants, both external and internal, should be employed. Professor Haughton has shown that nicotine and strychnine antagonize one another; on this assumption, strychnine, carefully administered, would be the proper antidote.

Tobacco has been used in medicine in the form of an enema, with the view of relaxing the muscular fibres, in cases of strangulated hernia, stricture of the bowel or urethra, tetanus, &c.; but in such cases, it has now been generally superseded by chloroform. If it continue to hold a place in the Pharmacopœia, it will probably be as an antidote to strychnine.

It must be recollected that *Indian Tobacco* has nothing in common with the subject of this article, and is a synonym for *Lobelia inflata*.

TOBACCO-PIPES are made of various materials, the commonest in Europe being a fine white clay, which has consequently received the name of *pipe-clay*. Their usual form is too well known to need description, but the manufacture of a clay tobacco-pipe is by no means a simple affair. The first part of the operation is performed by trained children, who, with nice skill, roll out upon a board a small piece of clay into a long slender cylindrical rod, at the end of which is then attached a lump of clay, just enough to form the bowl. These rudimentary pipes are arranged by dozens on a board, until they have become sufficiently hardened. They are then handed to the pipe-maker, who takes a pointed iron wire, and first dipping it into oil, pushes it into the end of the thin column of clay, and having passed it through, forms the bowl with a folding brass mould. The wire is then withdrawn; and after a slight dressing with a knife, the pipes, now complete, are slightly curved in the stem, and are laid by to dry for a few days, when they are removed to the kiln, which is of a peculiar construction, and consists of an interior chamber, with a number of small stages, so that the pipes can be conveniently arranged in circles without touching each other. This interior chamber can be closed so as to exclude smoke, and, in fact, is only a *seggar* on a large scale, such as is used in making Pottery (q. v.). The fire acts all round it, and fires or burns the pipes without smoking them. When thoroughly baked, they undergo a kind of polishing or dressing, and are fit for sale. Finer and more expensive pipes are made of Meerschaum (q. v.).

Under the head of PIPE-STICKS will be found an account of the various materials used for making the tubes of these and other pipe-bowls. *Brier-root pipes*, now very common, have the bowl and stem made of one piece of wood; and although the stem is short, they partially absorb the oil produced in smoking, which, however, is perhaps as much the case with the common clay-pipe when it is new.

Various opinions have been entertained as to the antiquity of the practice of smoking, and consequently of the use of pipes. That pipes for smoking herbs for medicinal and other purposes were in use in England and elsewhere long before the introduction of tobacco, is tolerably certain, and the custom is still prevalent in some places. Colt's-foot, yarrow, mouse-ear, lettuce,

and other plants are occasionally smoked, and no doubt have been so for centuries. A primitive kind of pipe, doubtless such as has been made generation after generation, is still in use in some remote districts. It consists of a stick of elder, from which the pith has been removed, with a bowl formed of common clay, and dried by the kitchen-fire. However much the habit of smoking herbs might obtain in Britain before that time, it is certain that to the introduction of tobacco is to be traced the rise of the trade of the pipe-maker. Pipes have been found in situations near the Roman wall in Northumberland, and other Roman stations in Britain, suggesting the idea that they were used by the Roman soldiers. But this opinion was relinquished by Dr. Bruce, the antiquary, who first propounded it; and very few now imagine that any of the pipes to be seen in the antiquarian museums of Europe are many centuries old. The names Danes' Pipes, Celts' Pipes, Elfin Pipes, Fairy Pipes, Old Man Pipes, &c., are popularly given to these old pipes, but afford no evidence as to their real antiquity. Many of them are remarkable for their very small size, whence, perhaps, some of the names; but this is easily accounted for by the consideration of the very high price of tobacco when first introduced into Europe, and the manner in which it was used, the smoke inhaled by the mouth being expelled through the nostrils, so that the narcotic power of the herb was enjoyed to the utmost.

Similar very small pipes have also been found in North America, and the same mode of using tobacco has always prevailed amongst the American Indians. See Wilson's *Prehistoric Man*, vol. ii. Stone pipes, or pipe-bowls, have also been found in Britain, cut in rude forms, and which apparently were used by the insertion of a tube, perhaps a straw. Such pipe-bowls, but elaborately carved, are amongst the most remarkable American antiquities. They continue, however, to be made by the American Indians to the present day, often of stones, which are not cut without great difficulty, and are adorned with figures of men and animals. Some of them are adapted for the insertion of two tubes, that two smokers may inhale the fumes of the tobacco at once. Among some of the American tribes, the greatest care is bestowed on the ornamenting of the pipe-stem; by others, on the bowl.

The clay-pipe, much the same as is now used, probably came into use very soon after the introduction of tobacco in Britain. Aubrey, writing in 1680, says that tobacco-smokers at first used silver pipes, 'but the ordinary sort made use of a walnut-shell and a straw.' In the reign of William III., pipes were occasionally made of brass and of iron. Examples of these are preserved in various collections. The pipe was, in the earlier days of smoking, passed round the table—one man taking a whiff or two, and then handing it to his neighbor; thus, one pipe of tobacco would 'suffice three or four men at once.' The annexed cut (fig. 1) represents one of the earliest forms of the clay-pipe, undoubtedly of the Elizabethan period. It has been supposed by some writers that the smaller the pipe, the more ancient is its date; but this is decidedly an error. The better criterion of age is the *form*, and the following examples will show the most pre-

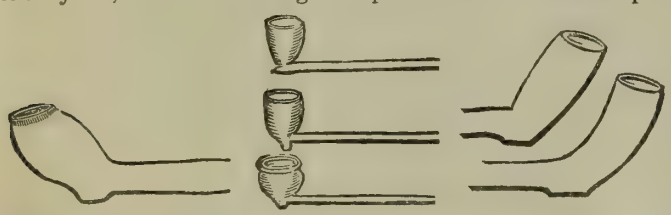


Fig. 1.—Pipe of the time of Queen Elizabeth. Fig. 2. Fig. 3.

valent shapes at different periods. The barrel-shaped bowl was most usual during the Commonwealth and the reign of Charles II., although it was made in many various shapes, which are well known from representations of them in prints of the time and on traders' tokens.

The annexed cut (fig. 2) represents English tobacco-pipes of the 17th century. In the reign of William III., a more elongated form of bowl (fig. 3) began to be prevalent, probably introduced from Holland, although the barrel-shaped bowl still continued to be used. In the middle of the 18th c., the wide-mouthed bowl, now so universal, became the prevalent form, and the spur, which had hitherto been flat, to rest the pipe upon when in use, was elongated, after a fashion supposed also to have originated in Holland. The Scottish *cutty-pipe* and Irish *dudeen* are short clay-pipes.

The most celebrated seat of the pipe-manufacture in Britain is Broseley, in Shropshire, where it appears to have been established in the middle of the 16th c., and has continued uninterruptedly to the present day. Many hands are employed, and many gross of pipes 'turned out' daily. Pipes are, however, made in many places, the clay being obtained from Purbeck.

The pipe-makers of London, as early as 1601, had privileges which gave them a monopoly. In 1619, the craft of pipe-makers was incorporated in England. Holland has long been famous for pipe-making. The Dutch manufacturers were very jealous of rivalry. In the middle of last century, a pipe-manufactory was established in Flanders, and the Dutch makers determined to ruin it. The duties were too high to admit of a large importation, and they therefore freighted a large ship entirely with tobacco-pipes, set sail to Ostend, and purposely wrecked her there. In accordance with the maritime laws of that city, the pipes were landed from the wreck, and sold at such 'ruinous prices' as defied competition; and the new manufactory at once sunk, and was closed.

TOBA'GO, one of the Windward Islands (see ANTILLES) belonging to Britain, lies 60 miles south-east of Grenada, and 18 miles north-east of Trinidad, is 32 miles long, from 6 to 9 broad, and has an area of 97 sq. miles. The island was discovered by Columbus in 1498, and named by him Assumption; the name of T. is supposed to have arisen from the free use of tobacco by the Caribs when first visited by Europeans. It came into British possession in 1764. From its gloomy-looking mountains, dense forests, and abrupt precipices, descending to the sea, T. has been called the 'Melancholy Isle;' but, on a nearer approach, the aspect becomes more pleasing, though still rough and irregular, being extensively occupied with conical hills and spurs, all connected by a ridge running through the interior, the greatest elevation of which is 1800 feet above the level of the sea. From the high ridge descend deep and narrow ravines, which terminate in small alluvial plains. Scarborough is its chief town, pleasantly situated on the shores of Rochley Bay, and at the base of a conical hill rising 422 feet in altitude, crowned by Fort King George. Plymouth, another town, is situated opposite Scarborough, on the leeward shore, about six miles distant, and is the landing-place for passengers, &c., from the royal mail-steamers. Two-thirds of the island is still covered with primitive forests, comprising many varieties of hard-woods and ornamental trees. The geological formation of the island is, on the whole, similar to that of Trinidad. The climate is considered salubrious; the thermometer ranges from 75° to 90°. The pop. in 1880 was 19,324. The island produces sugar, rum, molasses, cocoa-nuts, cotton, coffee, and indigo; pimento also grows wild. The quantity of sugar exported for the ten years preceding 1862, averaged 58,598 cwts. The value of sugar exported fluctuates from £40,000 to £85,000. In 1880 the total value of the exports was £77,615; of the imports, £45,138. The number of public schools has recently increased, and about 13 per cent. of the population were receiving education; a much higher average than in the other West India Islands. The island is governed by a lieutenant-governor, under the governor of Barbadoes as chief.

TOBERMO'RY. See MULL, ISLAND OF.

TOBIT, BOOK OF, one of the most curious and interesting of the Old Testament apocryphal books. It exists at present in Greek, Latin, Syriac, and Hebrew MSS., the texts of which differ considerably, yet not materially from each other. The oldest and most valuable is the Greek Septuagint; indeed, where the others depart from it, they possess little claim to our respect, although the *original* text was certainly not Greek. When and where the book was written, are questions to which various answers have been given; but the opinion of Ewald, who selects Persia as the scene, and the middle of the 4th c. B.C. as the date of its composition, agrees best with its internal character. The author he imagines to have been a Palestinian Jew who wrote in Hebrew, and conjectures that a translation of the work was made into Alexandrian Greek in the 1st c. B.C. That the contents of Tobit are not historical, scarcely requires proof in modern times; yet up to the period of the Reformation, no serious difficulty was felt in receiving it as such. Luther was the first to speak of it as a 'poetical,' i. e., an imaginary, didactic production; and since his time biblical critics have been pretty unanimous on the point; although some contend for what they call a historical basis. The leading incidents of the story do not differ by a hairbreadth in grotesque and puerile *miraculousness* from the fantastic extravaganzas of the Arabian Nights. Tobit, sleeping outside the wall of his courtyard one night, is blinded by sparrows 'muting warm dung into his eyes;' his son Tobias is attacked on the Tigris by a fish, which leaps out of the water to assail him; and marries a Jewish maiden called Sara, seven of whose betrothed lovers had been successively carried off by an evil spirit called Asmodeus. Asmodeus is driven off by an angel—who first appears under the name of Azarias, but subsequently turns out to be Raphael—and then flies to the uttermost parts of Egypt, where he is bound. Old Tobit is cured of blindness by an application to his eyes of the gall of the fish that had tried to devour his son. The sentiments are often very pious and didactic, the descriptions of social life are picturesque, and apparently true, but no excellence of that kind can reconcile us to the childish absurdities of the story.

TOBO'LSK, a government of West Siberia, occupies the north-west angle of the country, and is bounded on the N. by the Arctic Ocean, on the W. by the Ural Mountain, and on the E. by the governments of Yeniseisk and Tomsk. Area, 564,825 sq. m.; pop. (1870) 1,086,848, mostly Russians, but including also Ostiaks, Tartars, Bokharians, and Samoiedes. Branches of the Ural and Altaï Mountains form a hilly region in the west and south-east; but the government is for the most part an extensive plain, sloping to the banks of the principal rivers and to the shores of the Arctic Ocean. The chief rivers are the Ob (q. v.), and its great navigable affluents, the Irtish, Tobol, Om, and Toura. The soil is fertile in the southern and middle districts; marshes covered with forests occupy the land north of lat. 57°, and frozen marshes border the Arctic Ocean. See TUNDRA. The climate, mild in the middle districts, is severe in the north, and warm in the south. Dogs, martens, ermines, silver and blue foxes, bears, deer, &c., eider-ducks, geese, ducks, &c., are the principal animals. The chief crops are rye, oats, and barley. Agriculture employs the great mass of the inhabitants, except in the north, where hunting and fishing are the general occupations. The luxuriant meadows of the south are taken advantage of for cattle-breeding. Timber, furs, and fish are the chief articles of commerce.

TOBOLSK, a town of Western Siberia, capital of the government of the same name, stands at the confluence of the Irtish and the Tobol, 1976 miles east of St. Petersburg. It is well built, with timber houses and wide and regular streets and its position on the two great rivers is picturesque; but its lower part is subject almost annually to inundation from the high floods of the Irtish in spring. Its situation, considerably north of the great commercial highway between Russia and Siberia, and at a distance from the more productive regions of the country, is unfavorable for the development of commerce. T. contains a large prison, capable of accommodating 3000 prisoners; and the convicts condemned to exile in Siberia are first assembled at this town, and thence deported to various parts of the country. Several regiments are stationed here. Pop. (1880) 18,500.

TOCANTI'NS, an important river of Brazil, South America, rises in the province of Gojas, flows north through the province of Para, and joins the waters of the Para (q. v.), the southern branch of the estuary of the Amazon, 130 miles from the Atlantic. Its principal affluent is the Araguay, which joins it in lat. 6° S., and has a longer course, and bears along a greater volume of water than the stream to which it is tributary. The T., at its junction with the Araguay, is 5500 feet wide; at its mouth, it is 8 miles wide. Total length, 1100 miles. The navigation, which is carried on by trading-boats resembling floating houses, is dangerous, on account of the numerous falls, sandbanks, and rapids. Boats descend from Porto Imperial (lat. 10° 30′ S.) to the mouth of the T. in from 20 to 30 days; the upward voyage to the same port occupies from four to five months.

TOCHER, in the Law of Scotland, is an ancient name for the marriage-portion given by a father on the marriage of his daughter. It is settled according to the wish of the father, or as may be agreed with the intended husband of the daughter. Where the father by will leaves a legacy to his daughter, and afterwards during his lifetime gives her a like sum as a tocher, this is not presumed to be a satisfaction of the legacy, though it is otherwise in England. See MARRIAGE.

TOCQUEVILLE, ALEXIS CHARLES HENRI CLEREL DE, a French statesman, and the most eminent writer of this century on the science of politics, was born at Verneuil, in the department of Seine-et-Oise, 29th July 1805. His father was the representative of an old family, the Clerels, proprietors of Tocqueville in Normandy. The Clerels, although in the direct line *noblesse d'épée*, had been closely connected with the magistracy, and, indeed, might be considered to belong more properly to that order, which in France has produced so many distinguished men. The mother of De T. was a grand-daughter of Malesherbes, the academician, political writer, and magistrate, who defended Louis XVI. at the bar of the Convention, and whose fearless intrepidity was punished by the execution of himself and all the most distinguished of his relations. Madame de Tocqueville and her husband narrowly escaped the guillotine by the fall of Robespierre; but they did not emigrate, like other royalist families, and they preserved their property. At the Restoration in 1815, the father of De T. reassumed the title of Count, which belonged to the family before the Revolution. Young T. was called to the bar at Paris in 1825; and after a short tour in Italy, entered the magistracy as *juge auditeur*, at Versailles. In this situation, he carefully studied the administrative system of France; and struck by the perpetual recurrence of revolution, devoted much thought to political questions. In 1831, he threw up his appointment at Versailles, and with his colleague there, M. Gustave de Beaumont, accepted a government mission to America, to report on the working of the penitentiary system. The commissioners, after their return to Europe, published their report (*Du Système pénitentiaire aux Etats-Unis*, 1832; Eng. transl., Philadelphia, 1833)—an admirable work, which modified all the ideas previously entertained in France regarding prison-discipline. But this was not the most important result of their inquiries.

In 1835, De T. published his great work, *De la Démocratie en Amérique* (English transl. by Reeve, London 1835). In his introduction, he sought to show that a great democratic revolution has for centuries been going on in Europe. There is a general progress towards social equality, which must be looked on as a providential fact. In France, it has always been borne on by chance, the intelligent and moral classes of the nation never having connected themselves with it, in order to guide it. In America, he found that the same revolution has been going on more rapidly than in Europe, and has indeed nearly reached its limit in the absolute equality of conditions. There, accordingly, he thinks we may see what is about to happen in Europe. He points out that the people in America may be strictly said to govern. They make the laws and administer them. He draws from what he has observed the conclusion, that democracy may be reconciled with respect for property, deference for rights, safety to freedom, and reverence for religion. He does not propose the laws and manners of the Americans for the imitation of other democratic peoples. He merely seeks, by a faithful picture of an existing democracy, to allay the dread of democratic progress, and to induce those at the head of affairs to recognize it as irresistible, and to seek to control it by wise concessions. *The Democracy* made at once a great sensation. The accuracy of the statements, the skill with which the matter had been digested, and the beauty of the style, were loudly praised by critics. The author was described as the continuator of Montesquieu, and the greatest political writer of his time. He became successively a member of the Academy of Moral Sciences, and of the French Academy.

In 1835, De T. visited England, where his work had made him known, and where he received an enthusiastic welcome from the leaders of the Whig party. In the same year, he married Miss Mottley, an Englishwoman. He shortly afterwards, by a family arrangement, entered into possession of Tocqueville. He stood, in 1837, as candidate for the representation of Valognes in the Chamber of Deputies. His opponent was a retired mill-spinner, who raised the cry of 'No nobles' against him. Alluding to the great dovecot of Tocqueville, his opponent said: 'Prenez garde! Il va vous remener les pigeons.' De T. was defeated; but two years after, he had become a great favorite with his neighbors, the Norman farmers, and they returned him to the Chambers by an overwhelming majority. As a speaker, De T. did not succeed, but he exercised great influence on the legislature. Immediately after the revolution, he was the most formidable opponent of the Socialists and extreme Republicans. He opposed Louis Napoleon, as a man who believed in his right to the throne as firmly as Charles X. He became, however, in 1849, Vice-president of the Assembly; and from June to October in the same year, Minister of Foreign Affairs. At this time, he vindicated the policy of the expedition to Rome, on the ground, it must not be forgotten, that it would secure liberal institutions to the States of the Church. After the *coup d'état*, he returned to Tocqueville, where he devoted himself to agricultural pursuits. He there wrote *L'ancien Régime et la Révolution* (Par. 1856; Eng. transl., London and New York, 1856), a work worthy of his fame. In June 1858, he broke a blood-vessel, and was obliged to leave the bleak coast of Normandy for a warmer climate. He took up his abode at Cannes, where Lord Brougham and Chevalier Bunsen spared no effort to soothe his lingering illness. He died there, 16th April 1859. T.'s *Œuvres et Correspondance Inédites* were published in 2 vols. (1860), by his friend M. de Beaumont, who prefixed a biographical notice. The Eng. transl. of this work appeared at London and New York in 1861.

TOD (derivation unknown), a weight for wool, now unused; it was fixed at 28 lbs. avoirdupois in 1671.

TODARS, TODAWARS, or TUDAS,* a remarkable race inhabiting the upper part of the Neilgherry Mountains (q. v.), in Southern Hindustan. They are rapidly diminishing in number, chiefly owing to the practice of Polyandry (q. v.), and their not allowing intermixture with other races; in 1871, there were 405 men and 288 women. They are tall, well proportioned, and athletic, with finely moulded limbs, and bold, independent carriage; the nose aquiline, with black, bushy hair and beard. The dress of the men consists of a single toga, worn so as to leave the right arm free, not unlike the plaid of the Scottish Highlander. Both sexes are of a dull copper color, but the women are rather fairer than the men, and are often tall and handsome in feature and person. They have no occupation except tending their herds of buffaloes, and converting the milk into butter. The buffalo, indeed, is so important to them, that they look on the pen where the herd is cooped up at night with superstitious veneration. They

* 'Written also *Toda*, *Thoda*, *Thodaurur*. The name of a pastoral people inhabiting the Nilghiri Mountains, and claiming to be the original occupants and proprietors of the whole of the hilly country.'—Dr. H. H. Wilson's *Glossary of Indian Words*.

never attempt the cultivation of the land around them, as they obtain what grain they require from the Burghers and other agricultural tribes, who pay it in the shape of tribute (*goodoo*) for the lands they cultivate, over which the T. assert an imaginary right. The T. hold that their ancestors were the aboriginal inhabitants of these regions (see INDIA, *Inhabitants*); that the Kothers, and afterwards the Burghers, came among them; and that they allowed these tribes to cultivate land on condition of paying a goodoo of one-sixth of the harvest. The Burghers continue to pay this tribute of grain, but only in such amount as suits their own wants and inclinations, and rather in the shape of charity than otherwise.

The only use the T. get of the buffaloes, besides their milk, is to furnish sacrifices to the manes of the dead. They are wont to salute the sun at his rising and setting, and believe that the soul after death goes to the 'great country.' They have no distinct places of worship, except the hut in which they keep their milk, where they pour out in libations to their deities what remains after their daily consumption. They have never been known to steal the smallest article. Their language is of the Dravidian stock, and is either a separate language lying between Kanarese and Tamil, or a jargon compounded of these two. It has no written character. Their mode of collecting the goodoo is singular enough: 'As soon as harvest is over, and the goodoo collected in Todanaad, the Toda men of that division pay visits to the munds (villages, or groups of huts) in Meyleanaad and Paranganaad, and take up their abode with the women of the community (to the temporary exclusion, as is the custom, of the legitimate husband). They then pay visits to the surrounding Burgher villages, and demand in their right, as temporary husbands of the women of the naad, the goodoo, which, strange to say, is paid, and thus the same man, perhaps, who has laid a whole village in his own naad under contribution, goes the round of the other two naads, appropriating the fruits of the Burghers' labor and industry; and carrying off enough grain to support his whole community in idleness and plenty until the arrival of the next year's harvest-time, and to produce by sale in the nearest bazaar sufficient money to pay the tax which is levied yearly on their tribe. I should have refused credence to such a statement, had I not received it on the best authority, that of the tahsildar of the district.'—See *Statistical Memoir of a Survey of the Neilgherry Mountains*, 1861; Harkness's *Description of a Singular Aboriginal Race*, 1832; Burton's *Goa and the Blue Mountains*, 1861; the researches of Ochterlony, Caldwell, Oppert, and Shortt; Marshall's *Phrenologist among the Todas*, 1873; Tyler in *Nature*, 1873.

TODDY, the name given in the East Indies to the fermented juice of various palms from which Arrack (q. v.) is distilled. The name has been adopted in Britain for a mixture of whisky, sugar, and hot water, which forms a popular drink in Scotland. See SPIRIT.

TODLEBEN, FRANZ EDWARD, Russian general of Engineers, was born at Mitau, Russian province of Courland, in 1818. After studying at Riga, he was admitted as a student in the College of Engineers at St. Petersburg. He was second-captain in the engineer corps when the Russian army entered the Danubian Principalities in 1853, and served in the campaign of the Danube under General Schilders. His genius as a military engineer was discovered before the Russian army crossed the Pruth, on its retreat from the Principalities; and when the French and English troops undertook the siege of Sebastopol, Colonel T. was sent to assist in its defence. It was in the middle of April when he arrived, and the fortifications were soon placed under his direction. The principle on which he acted was to watch the works of the allies, and to establish against them on every point a superiority of fire, by multiplying the number and increasing the calibre of his guns. The prodigious activity displayed by the Russians in making good the damage sustained by the heavy fire of the enemy, filled the allied army with astonishment. Everywhere, massive ramparts of earthworks, mounted with formidable batteries, rose up as if by magic at each threatened point within the line of defence. According to T., the defence was rapidly asserting an engineering superiority over the attack. The Malakoff, however, was carried by assault, and the allies entered Sebastopol (see the story of the war in Kinglake's work, *The Invasion of the Crimea*).

At the battle of Inkermann, T., who was on the spot by chance, seeing that the Russian artillery was in danger of being taken, promptly halted a regiment, caused four guns to open fire on the allies, and gave time to the artillery to retreat. At the latter part of the siege, he was wounded in the leg, but all his great defences had then been completed. Since the conclusion of peace, he has expanded what was at first a mere engineer's report into a history of the war in the Crimea. It is entitled *Défense de Sebastopol: ouvrage rédigé sous la Direction de Lt.-Gen. E. de Todleben, aide-de-camp général de S.M. l'Empereur*. In this work, he writes a thoroughly Russian account of the Crimean war. In all that relates to the Russian army and its labors, and especially in regard to the work of the siege, the author may be accepted as an unimpeachable authority; but where the British and French armies are concerned, he is too often careless and inexact, and sometimes his statements are absolutely untrue. For services in the siege, he was created a general and decorated. In 1865 he visited England, and was cordially received. He performed distinguished service in the war with Turkey in 1877–78.

TODMO'RDEN, a market-town of England, in the county of Lancaster, on the border of Yorkshire, 8 miles north-north-east from Rochdale, on the Manchester Railway. The town is well built, has several churches and schools, and manufactures of cotton. Coal abounds in the vicinity. The town proper of T. is composed of houses belonging to three townships, pop. (1871) 11,998; (1881) 23,861.

TO'FFEE, or TOFFY, a sweetmeat made of sugar, melted with about half its weight of butter. Much care is required in making it, to insure its being crisp when cold. It should be kept over the fire and slightly simmered for a quarter of an hour, when small drops are taken and let fall on a marble slab to cool quickly for trial; if they become brittle, it is complete. Everton, near Liverpool, has a name for its toffee.

TO'GA (from Lat. *tego*, to cover) was the principal outer garment of the Romans, and originally, perhaps, the only one. Subsequently, an under-garment, the *tunic*, was added. It was probably of Etruscan origin, and yet it came to be considered the distinctive badge of the Roman citizen, whence the Roman people are called *togati*, or *gens togata;* and consequently, when the Cisalpine Gauls received the rights of citizenship, their country was spoken of as *Gallia togata*, in opposition to Transalpine Gaul, or *Gallia braccata* (breeched). At first, it was apparently semicircular in shape—so, at least, say Dionysius, Quintilian, and others—but afterwards, when it came to be an elaborate and complicated dress, it must have been a smaller segment than a semi-circle. The mode of wearing the toga is difficult to describe, and required considerable art to make the folds fall gracefully. The toga was made of woollen cloth, and except in the case of mourners, was of a white color. Accused persons sought to excite sympathy by going about in a soiled (*sordida*) and unsightly toga; while those who were seeking office were wont to dress themselves out in garments which had been made artificially bright by the help of chalk, hence their name of *Candidati* (lit. shining ones), candidates.

Roman Toga.

The *toga prætexta* had a broad purple border, and was worn by children, and most though not all of the magistrates. The *toga picta*, so called from being ornamented with embroidery, was worn by generals when enjoying their 'triumphs.' Under the emperors, the toga, as an article of common wear, fell into disuse, the Greek *pallium* and other garments being used instead; but it continued to be used by officials on solemn or festive occasions.

Toggel.

TO'GGEL, on Shipboard, a short bar of hard wood, *a*, tapering from the middle towards each end, placed in an eye at the end of a rope, as a convenient obstacle to the rope passing through a loop or knot.

TO'GGENBURG, or TOCKENBURG, a district in Switzerland, within the canton of St.Gall, formed by the long and fertile valley of the Thur. It was formerly governed by counts of its own, who ranked as the richest and most powerful land-proprietors in the country. On the extinction of their line in 1436, the possessions passed to the Barons of Rasen, who sold them in 1469 to the Abbot of St. Gall. Since 1803, T. has formed part of the canton of that name. The valley is thickly peopled by an industrious race, who carry on the manufacture of muslin and cotton. The most interesting spot in the whole region is Wildhaus, in the Johannisthal, a little mountain village more than 2000 feet above the level of Lake Zürich, where Ulrich Zwingli, the Swiss reformer, was born.

TOISE, in the ancient French system of measures, was the unit of linear dimension, and was divided into 6 feet, each foot (*pied*) into 12 inches, and each inch (*pouce*), into 12 lines (*lignes* or *points*). It is equivalent to 1·94903659 French mètres, or to 6·3946 English feet.

TOKA'T, a tow of Turkey in Asia, west from Trebizond, and 60 miles from the south shore of the Black Sea, stands at the mouth of a defile, on the banks of a small stream. It is enclosed by mountains on three sides, so that in summer the heat is intol-

erable. Gardens and vineyards extend along the slopes of the valley to the distance of three miles above the town. The town consists principally of wooden huts, disposed in narrow and dark streets. It was formerly a place of considerable trade, but its importance as a commercial mart has declined. Extensive copper-furnaces, however, in which copper ore, brought from near Diarbekir, by means of mules and camels, is smelted, still exist, and give employment to many persons. Cotton-printing and dyeing are also carried on. Pop. 35,000.

TOKA'Y, a species of wine obtained from the vines which grow on the Hegyallya Mountains, a group stretching north and north-east of Tokay. The T. wine-district comprises about 15,000 English imperial acres, the produce from the Mezesmali, a detached rounded eminence near Tokay, being most esteemed. Great care is bestowed on the proper assortment of the grapes (which are never gathered till fully ripe); and also on the preparation of the wine—of which about 34 sorts are reckoned; but all of these may be grouped into the two classes of sweet and dry. The wine is brownish yellow while new, changing to a greenish hue as it grows older. The average annual produce of the T. vineyards is 1,500,000 imperial gallons of the dry, and 50,000 gallons of the sweet, wines. T. wine enjoys an immense reputation on the continent for its great restorative and tonic qualities; and so much is it esteemed in Hungary, that every considerable proprietor for miles round makes it a point to acquire some property in this vine-district, that he may be able to procure his wine from his own vineyards. On this account, genuine T. is obtainable by wine-merchants only in small quantity (and this is especially the case with the more valuable sort, the sweet or imperial T.), and is largely mixed with inferior wines, to increase the amount.

The vine-gathering is celebrated at Tokay, Maad, and Tallya, the chief places of the district, as a national fête, to which the magnates of Hungary with their families flock from all quarters; and during the season of festivity, many times more than the whole value of the vintage is expended. The crowd of visitors is swelled largely by the wine-dealers and medical agents, who eagerly buy up such lots as are for sale, and sometimes give the most extravagant prices for imperial or other good qualities of wine. Large quantities of 'imitation' T. are made by French and German chemists, and sent to all parts of Europe, not excepting Hungary itself, so that purchasers require to guard against imposition by dealing only with the grower or his accredited agent.

TO-KEI, or TOKIO. See YEDO.

TOKEN, the name given to a kind of money which was at certain periods current in Britain, by sufferance, and not by royal authority. Tokens first came into use in England in the reign of Henry VIII., in consequence of the want of any authorized coins

Fig. 1.—Token of the Triumph, or Pageant Tavern, Charing Cross, 1661.

to represent the fractions of a penny; and in the reign of Elizabeth, stamped tokens of lead, tin, and even leather, issued by vintners, grocers, and other tradesmen, passed largely from hand to hand, and were payable at the shops where they were issued. The corporations of Bristol, Oxford, and Worcester, had also their tokens. In 1613, a royal proclamation authorized Lord Harrington to issue

Fig. 2.—Token of the Mermaid Tavern, Cheapside, London, about beginning of 17th century.

farthing tokens, and prohibited the use of private tokens under penalties. This prohibition was renewed by Charles I., who granted to the Duchess of Richmond, Sir Francis Crane, and others, the exclusive right of coining authorized farthings for seventeen years; but the farthings made by these patentees were the subject of much discontent, as they were greatly below the intrinsic value of the metal. In the face of these prohibitions, private tokens, principally of brass, continued to circulate, and were especially abundant during the Civil War. Numerous tradesmen's tokens, mostly of copper, were again struck during the scarcity of money, at the close of last century. On account of the scarcity of current silver money, previous to the new coinage of 1817, silver pieces known as Bank Tokens, of the respective values of 5*s*., 3*s*., and 1*s*. 6*d*., were issued by the Bank of England: they were called in on the revision of the coinage.—See Chambers's *Book of Days*, vol. i. p. 535.

TOLAND, JOHN, a well-known deistical writer, of the 17th and 18th c., was born near the village of Redcastle, in the county of Londonderry, Ireland, November 30, 1669 (or 1670). His parents were Roman Catholics, and he was brought up in that religion. His baptismal name was James Junius; but the ridicule which it drew upon him at school, led him to change it into John, by which he is now known. He was educated at Redcastle, and entered the university of Glasgow in 1687, but removed to that of Edinburgh, where he took the degree of Master of Arts in 1690. Thence he passed to Leyden, where (having abandoned at Edinburgh the Roman Catholic faith) he entered upon theological studies with a view to orders as a nonconformist minister. One of his masters at Leyden was the celebrated Spanheim. He remained there about two years, during which time he made the acquaintance of Leibnitz and some other distinguished men; and on his return to England, he resided for some time at Oxford, where his extravagant vanity, and the reckless boldness of his opinions on religion, drew on him much notice. In the Bodleian Library, he collected the materials of more than one of his later publications, and prepared in great part the work entitled *Christianity not Mysterious*, which he published in London in 1696, and in which he fully avowed his unbelieving principles. The work created a great sensation in the theological world. It was censured by Convocation, and led to several replies (among which, those of Payne and Stillingfleet may be specially noticed); and in the following year, T. resolved to return to Ireland, sending before him a large number of copies of his work; but he was received no less unfavorably than in England, and his book was burned publicly by the common hangman, in virtue of an express vote of the Irish parliament. Finding it necessary to flee from Ireland, T. returned to London, where he published a defence against this judgment of the Irish parliament; but he soon afterwards turned his pen from theological to political and literary subjects. A pamphlet entitled *Anglia Libera*, on the succession of the House of Brunswick, led to his being received with favor by the Princess Sophia at the court of Hanover; and to his being sent on a kind of political mission to some of the German courts.

During his residence abroad, he published in 1702 a vindication of his book against the judgment of the Convocation, the tone of which was considerably more moderate; but again, in 1705, he out-stripped the boldness of his former opinions and with still less of disguise, openly avowing himself a pantheist. In this course he was emboldened by the patronage of Harley, in whose service he had engaged as a political pamphleteer, and by whom he was sent abroad to Holland and Germany in 1707, in a capacity which, however he disavowed it, was plainly that of a political spy. He returned to England in 1710; and having forfeited the favor of his patron, or at least having separated from him, he engaged as a partisan pamphleteer on the side of Harley's adversaries.

His after-life was that of a literary adventurer, and was checkered by every variety of literary conflict and pecuniary struggle. It forms one of the most curious and painful chapters in D'Israeli's *Calamities of Authors*. He resided from the year 1718 at Putney, where he died, March 11, 1722, in his 52d or 53d year; and it is observed by Disraeli, that on his table was found an *Essay on Physic without Physicians*, which he was writing, in revenge for the unskilful treatment which he himself had suffered in his malady.

Of his works, which were very numerous, but have never been collected into a uniform edition, the following are the most remarkable: *Christianity not Mysterious: a treatise showing that there is nothing in the Gospel contrary to Reason, nor above it*, (Lond. 1696); *Apology for Mr. Toland* (1697); *Life of Milton*, prefixed to Milton's works, 3 vols. folio (1698); *Anglia Libera, or the Limitation and Succession of the Crown explained and asserted* (1701); *Vindicus Liberius, or Mr. Toland's defence of Himself against the Lower House of Convocation* (1702); *Socinianism truly stated* (1705); *Reasons for naturalizing the Jews* (1714); *State Anatomy of Great Britain* (1714); *Nazarenus, or Jewish, Gentile, or Mahometan Christianity* (1718). A detailed account of these works would be out of place, but they all exhibit in a general way the characteristics described above. His Posthumous Works were published in 2 vols. 8vo., in 1726, with a life by Des Maizeaux. An *Account of Toland's Life and Writings*, ascribed to Curle, had previously appeared in 1722. It should be added that the above list is far from containing all the writings of this now little known, but once active and notorious polemic.

TOLE'DO, a famous city of Spain, capital of the province of the same name, and long the capital of the whole country, stands

on the north bank of the Tagus, by which it is encompassed on three sides, 55 miles south-south-west of Madrid by railway. It is situated on a number of hills at the height of about 2400 feet above sea-level; and the climate, excessively hot in summer, is bitterly cold in winter. The Tagus is the great fortress of the town. Rushing round it, on the east, south, and west, between high and rocky banks, it leaves only one approach on the land-side, which is defended by an inner and an outer wall, the former built by the Gothic king Wamba, in the 7th c.; the latter by Alfonso VI. in 1109, and both remarkable for the number and beauty of their towers and gates. Seen from a distance, the city has a most imposing appearance; within, it is gloomy, silent, inert, and its narrow streets are irregular, ill-paved, and steep. In the middle of the city, rises the lofty, massive cathedral, surrounded by numerous churches and convents, mostly deserted, for here the churches are without congregations, and the streets and walks are almost destitute of people. The cathedral, completed in 1492, and built on the site of a former mosque, is a large edifice, in simple, pointed Gothic. It was ransacked and plundered in 1521 and 1808, but previous to these events, its interior was of the most magnificent description. The stained glass that remains is superb; the choir is a perfect museum of high-class sculpture; and there are two pulpits of metal, gilt, the workmanship of which is as fine as that of the richest plate. The cathedral is 404 feet long, and 204 feet wide; and has 5 naves, supported on 84 piers. Connected with the cathedral are an extraordinary number of chapels, of great interest, alike from their architectural beauty, their decorations, and their historical associations. The Zocodover, 'square market,' thoroughly Moorish in its architectural character, is a fashionable promenade, and was for years the site on which heretics were burned, and bull-fights took place.

The *Fabrica de Armas*, or manufactory of Toledan swords, a huge, rectangular, unsightly building, standing on the right bank of the Tagus, was erected in 1788, though long before that time the Toledan blades had become famous, and the fondness of the Iberians for their weapons, as well as the weapons themselves, were written about both by Livy and Polybius. The temper of the best Toledan blades is such, 'that they are sometimes packed up in boxes, curled up like the mainspring of a watch.' The buildings of the town also include a theological seminary, military school, female college, hospitals, and manufactories of coarse woollens, paper, guitar-strings, and leather. Pop. (1877) 21,297.

T., the *Toletum* of the Romans, is of very early origin, and was taken by Marius Fulvius in 193 B.C. It was the capital of the Goths during their dominions; in 714, it fell into the possession of the Moors, who retained it till 1085, when it was permanently annexed to the crown of Castile. In the days of its highest prosperity, it is said to have contained 200,000 inhabitants.

TOLEDO, a city of Ohio, U. S., finely built on the estuary of the Maumee River, near the western extremity of Lake Erie, 92 miles west of Cleveland, and 53 miles south-west of Detroit. It has a fine harbor, and very extensive railway connections; and is the terminus of the Miami-and-Erie, and Wabash-and-Erie canals, together 700 miles in length. The local and transit trade is immense. It has 45 churches, a convent, 3 asylums, 3 daily and 9 other newspapers, large warehouses, machine-shops, foundries, flour-mills, &c. Its commerce in 1870 was in exports, 1,836,782 dollars; imports, 283,329. Its 10 grain elevators can store 4,017,000 bushels. Pop. (1870) 31,731; (1880) 50,143.

TOLENTI'NO (*Tolentinum*), a city of Central Italy, province of Macerata, 11 miles south of Macerata, on a rising ground, left bank of the Chienti. It has a fine cathedral dedicated to St. Nicholas, and a town-hall with ancient inscriptions, a statute of Agrippina, and several good paintings. T. has been a bishop's see from the 5th century. In the Parisani Palace at T., Pius VI. signed a treaty with Bonaparte in 1797, by which the pope ceded Bologna, Ferrara, and the Romagna to the Cisalpine Republic. Under the French Empire, it formed part of the department of Musone. Here Murat was defeated by the Austrians (1815). Pop. 5,000.

TOLERA'TION is the liberty which, in some countries where a particular form of religion is established by law, is allowed to nonconformists to publicly teach and defend their theological and ecclesiastical opinions, and to worship whom and how they please, or not at all. But no permission is thereby given to violate the rights of others, or to infringe laws designed for the protection of decency, morality, and good order, or for the security of the governing power. The enforcement of this class of laws, which have merely civil and political objects in view, is indispensable to the public welfare, and must proceed without regard to the notions of religious duty which their contraveners may entertain or profess. In Britain, there are still in force certain statutes imposing penalties on opinions and practices generally regarded as impious, and which were thought to be criminal because of their offensiveness to God (see BLASPHEMY); but these laws are seldom executed now, the opinion having become prevalent, that, except when the religious feelings of the public are so wantonly outraged as to make the perpetrator a nuisance, theological error is best opposed by refuting it, and that when those accused of Heresy (q. v.) are men of piety and earnest conviction, any degree of severity short of extirpation tends rather to diffuse than to suppress their tenets.

Besides, the right of private judgment in matters of faith and worship is now more generally recognized *in practice* than it used to be, though such is human pride that even yet many resent the exercise, by their neighbors who differ from them, of the freedom which they claim for themselves. They seem to forget the maxim that we should do to others as we would have others to do to us —a principle admirably applied by St. Paul to the case of religious differences (Rom. xiv.), and which indeed is the only one that has been found to work well in all circumstances for every sect: it condemns not only political disabilities and restraints unwarranted by the exigencies of the state, but still more, that uncharitable treatment through which, almost exclusively, the spirit of intolerance can now find a vent in free Protestant countries. Were it not for the inconsistency thus displayed in our own day by many professing advocates of the right of private judgment, it might seem wonderful that the Reformers, by whom that right was first asserted, and who on no other ground could justify their separation from the church of Rome, became in their turn the persecutors, not only of the Romanists, who had persecuted them, but of such fellow-Protestants as had drawn from Scripture conclusions that differed from their own. Instances of such inconsistency on the part of the reformers and their successors will be found in the articles CALVIN SERVETUS, SOCINUS, BIDDLE, and JEWS. In a church claiming Infallibility (q. v.), and believing that salvation is unattainable beyond her pale, it is not only consistant, but to her most earnest members must seem a duty, to prevent by force the spread of what is accounted a fatal heresy; and, in fact, toleration has never been either professed or practiced by the church of Rome. See ALBIGENSES, WALDENSES, DOMINICANS, INQUISITION, HUGUENOTS, BARTHOLOMEW'S (ST.) DAY, NANTES (EDICT OF), CEVENNES, DRAGONNADES. But even the Puritans (q. v.), though long oppressed themselves, were so blind to the right of others to differ from them, that in their own brief day of power they eagerly repudiated, by word and deed, as a monstrous and impious error, the principle of a universal toleration.

In the Assembly of Divines (q. v.) held at Westminster in 1643 —1646, the Presbyterian members fought successfully against the proposal of the Independents that all sects should alike be tolerated. 'We hope,' wrote Baillie to his Presbyterian friends in Scotland, 'that God will assist us to remonstrate the wickedness of such a toleration . . . . For this point, both they and we contend *tanquam pro aris et focis*' (Baillie's Letters, ii. 328, 350; Bannatyne Club ed.: see also the strong expressions of George Gillespie, another member of the Assembly, in his *Propositions concerning the Ministry and Government of the Church*, prop. 41 and 42). We accordingly find in the 23d chapter of the *Westminster Confession* an assertion of the duty of the magistrate to promote the true religion, and to restrain and punish heterodoxy—a principle which, soon after the Restoration, was found to work very inconveniently for the Presbyterians themselves, the magistrate being then one who differed from them as to what the true religion was. The Independents, on the other hand, had learned the lesson of toleration in Holland—that nursery of liberty in modern Europe—whither they had fled from oppression in the reign of James I.; and it is a mistake to suppose, as some have done, that they were the first to understand and practise the principles of religious freedom.

In the 16th c., Zuinglius and the Hungarian reformer Dudith, disclaimed, by word and action alike, the notion that any man is entitled to assume, in his dealings with others, that his own interpretations of Scripture are true, and those of other men, if different, false and culpable. 'You contend,' wrote Dudith to Beza, 'that Scripture is a perfect rule of faith and practice. But you are all divided about the sense of Scripture, and you have not settled who shall be judge. You say one thing; your opponent, Stancarus, says another. You quote Scripture; he quotes Scripture. You reason; he reasons. You require me to believe you: I respect you; but why should I trust you rather than Stancarus? You say he is a heretic; but the papists say you are both heretics. Shall I believe them? . . . . You say that your lay hearers, the magistrates, and not you, are to be blamed, for it is they who banish and burn for heresy. I know you make this excuse; but tell me, have not you instilled such principles into their ears? . . . . Do you not daily teach that they who appeal from your Confessions to Scripture ought to be punished by the secular power? . . . . When you talk of your Augsburg Confession, and your Helvetic Creed, and your unanimity, and your fundamental truths, I keep thinking of the sixth commandment—"Thou shalt not kill."' In the history of England, also, from the Reformation to the Commonwealth, there is, as Bishop Heber has ob-

served, 'abundant proof that (much as every religious party, in its turn, had suffered from persecution, and loudly and bitterly as each had, in its own particular instance, complained of the severities exercised against its members) no party had yet been found to perceive the great wickedness of persecution in the abstract, or the moral unfitness of temporal punishment as an engine of religious controversy. Even the sects who were themselves under oppression exclaimed against their rulers, not as being persecutors at all, but as persecuting those who professed *the truth;* and each sect, as it obtained the power to wield the secular weapon, esteemed it also a duty, as well as a privilege, not to bear the sword in vain.'—*Life of Jeremy Taylor*, p. 27.

It is chiefly to the many keen discussions in Holland and England during the century which followed the Restoration (aided, no doubt, by that moderation or indifference which characterized the Protestant churches a hundred years ago—by the ever-increasing number and power of the dissenters—and by that wider mental culture which enables men not only to see that diversity of mental gifts and acquirements naturally leads to diversity of opinion, but, in Cromwell's language, to 'think it possible they may be mistaken'), that we must ascribe the tolerant spirit now actuating most of the statesmen of England and the United States, and which has lately made rapid progress among the people at large. Not only is the *right* of free thought and discussion now generally recognized, but its *necessity* to the well-being of mankind is asserted by eminent thinkers. Mr. John Stuart Mill, in his able treatise *On Liberty*, thus sums up the grounds on which the necessity of such freedom is affirmed by him: '(1) If any opinion is compelled to silence, that opinion may, for aught we can certainly know, be true. To deny this, is to assume our own infallibility. (2) Though the silenced opinion be an error, it may, and very commonly does, contain a portion of truth; and since the general or prevailing opinion on any subject is rarely or never the whole truth, it is only by the collision of adverse opinions that the remainder of the truth has any chance of being supplied. (3) Even if the received opinion be not only true, but the whole truth; unless it is suffered to be, and actually is, vigorously and earnestly contested, it will, by most of those who receive it, be held in the manner of a prejudice, with little comprehension or feeling of its rational grounds. And not only this, but (4) the meaning of the doctrine itself will be in danger of being lost, or enfeebled, and deprived of its vital effect on the character and conduct; the dogma becoming a mere formal profession, inefficacious for good, but cumbering the ground, and preventing the growth of any real and heartfelt conviction, from reason or personal experience' (p. 95).

TOLERATION, ACT OF. See ACT OF TOLERATION.

TOLL (Gr. *telos*, a public tax; Gr. *telonion*, Lat. *telonium*, a toll-house; Ang.-Sax. *tol*, Ger. *zoll*, seem related to the root Ger. *zahl-*, Eng. *tell*, to count, to pay), a payment exacted under a royal grant, or some prescriptive usage, or by express statute; such as by the owner of a port for goods landed or shipped, by the owner of a market or fair for articles sold, or by those charged with the maintenance of roads, streets, bridges, &c., for the passage of persons, goods, or cattle. It is essential in a toll that it be for some reasonable consideration; otherwise, it is void. In modern times, the right to take toll is always created by statute, and nothing short of statutory authority will authorize its levy, for it is a species of tax.

Many tolls receive special names, as dues, customs, &c.; and the term toll is now mostly used in connection with turnpike roads (so called from the turnpike or gate turning on an upright axis or pike, at which the tolls are collected) and bridges. See HIGHWAY.

The first express authorization of a road-toll on record bears date 1346, when a commission was granted by King Edward III. to lay a toll on carriages passing from St. Giles to Temple Bar, and also on carriages passing towards Portpool, now Gray's Inn Lane, London, the roads in those places having become impassable from want of other provision for their maintenance. From that small beginning, the turnpike system gradually spread itself over all England, and latterly over Scotland and Ireland. The earliest Scottish Turnpike Act was passed in 1750. Previously, by statutory enactments in 1617, 1661, and 1669, the Scottish highways were made and maintained by what is called the 'statute-labor' system, under which the laboring population could be called on to give six days' work yearly upon the roads in their parishes. This poll-tax, either in the shape of personal labor, or of conversion-money in lieu of it, remained in force, in regard to all but turnpike roads, till 1845, when the General Statute-Labor Amendment Act (8 and 9 Vict. c. 41) abolished it, and substituted assessments on land.

Beginning with 1750, turnpike roads gradually spread over Scotland, under authority of about 400 separate acts of parliament, till there was a very considerable mileage; and in Ireland, the turnpike system extended over all the kingdom. According to a parliamentary Report in 1840, there were in England and Wales 104,772 miles of turnpike roads; and a similar Report for Scotland in 1859 gives 5768 miles of turnpike roads in that kingdom, with 1060 toll-gates thereon. The original erection of toll-gates excited violent opposition in many parts of the country, and their maintenance has frequently led to popular violence and rioting.* Even those who are sensible that good roads are worth paying for at any reasonable cost, have all along felt the toll-system to be an annoyance and obstruction to traffic, from the continual stoppages to pay or exhibit tickets; often unjust in its application; and unnecessarily expensive. The wastefulness of the turnpike system is astonishing to think of. The local acts of parliament, and the constantly recurring litigation, is a serious expense, to begin with; but the chief waste is in the machinery for collecting the revenue. Besides the erection and maintenance of toll-houses and gates (one for every 6 to 8 miles), there were, at the census of 1871, about 5000 persons employed in England and Scotland as toll-collectors; and assuming these to be heads of families with five persons in each, there are (or were) 25,000 individuals to be maintained, which must absorb a high percentage of the revenue levied on the public.

In 1845, Mr. William Pagan of Cupar-Fife published a plan of 'Road Reform,' in which he directed public attention to the evils of the toll-bar system, and advised its discontinuance, the substitute proposed by him being a rate on horses, or an assessment on the lands and heritages in each county and burgh, for the support of all roads (statute-labor roads included) and bridges within the respective counties and burghs.

Ireland, which was studded all over with gates on its turnpike roads, took the lead in toll-bar abolition. The roads in the south of Ireland were the first cleared of gates; Dublin and its environs followed; and an act was passed in 1857, abolishing the whole of the remaining toll-bars; and by April 5 following, the toll-bar system, and all its costs and charges and vexations, disappeared from Ireland. There, the supporting of the roads by land-assessment is much preferred to the defunct toll system. The Isle of Man also is overspread with excellent roads, with no tolls upon them. The financial management of roads by turnpike trustees in England and Scotland has proved eminently unsuccessful, there being some years ago a debt on the turnpike roads in England to the amount of about four millions sterling, and in Scotland, to the amount of two millions and a half.

The question of toll-bar abolition has been much agitated in England—the inconvenience of the system becoming every day more sensibly felt since the introduction of railways. The efforts of the Anti-toll Association of London have succeeded in freeing the suburbs of the metropolis, and a considerable space on both sides of the Thames, from 153 toll-gates. In recent years, annual acts of parliament have passed in England, gradually effecting the extinction and winding up of many turnpike trusts which have been long insolvent in all parts of the country. Various acts of parliament empower the highway authorities, 'turnpike trusts and highway boards,' to abolish tolls and charge the cost as an improvement of the highways. In Scotland, several attempts were made after 1859 to obtain a general act, compulsory or permissive, for the abolition of tolls. Various counties obtained acts for themselves, for maintaining their roads and bridges by assessment on

* Notably in South Wales, in 1843, where a band of conspirators, calling themselves Rebeccaites (in allusion to Gen. xxiv. 60), carried on the systematic demolition of toll gates and houses for nearly a year.

lands and heritages—the rule usually being, that the proprietors should clear off any debt on the roads, and that the maintenance should be divided between proprietors and tenants.

The counties which obtained abolition acts, were: Aberdeen, Banff, Caithness, Cromarty, Elgin, Dumfries, Haddington, Kirkcudbright, Nairn, Peebles, Ross, and Wigton. Argyle, Bute, Orkney, Sutherland, and Shetland never adopted the toll-bar system. The Roads and Bridges Act, 1878, provided that tolls should be altogether abolished in Scotland in 1883, and any time before then in such counties as voluntarily adopt the Act, whose main provisions are similar to those adopted by the counties which had previously abolished tolls. Toll revenues have diminished from the diversion of the through-traffic to railways; while the chief costs, and notably that of collection, remain as great as before. Notwithstanding the prejudices, and narrow mistaken views of personal and local interests, which continue to resist this, as they have resisted most other important reforms, the remainder of the toll-bar system must give way, and the word 'toll,' as applied to collection of moneys at gates on public roads, become obsolete.

TOLLENS, HENDRIK, the most popular Dutch poet of modern times, was born at Rotterdam, September 24, 1780. At the early age of 14, his father, a merchant in dyestuffs, placed him in his counting-house, and first looked favorably upon, but afterwards discouraged the boy's poetical efforts. The sympathies of young T. were at that time with what was called the patriotic party, who thought that the entrance of the French, in 1795, would be the cure for all political evils, and he made many verses in the spirit of the times. In his 17th year, he began to study English, German, and Latin; but French literature was his favorite study, and translations of French tragedies his chief work. At 19, he published translations from the French poets, under the title of *A Nosegay of Fragrant Flowers, culled on French Ground.* Three years later, appeared his *New Songs and Idyls*, in which he first came out as an original poet. Shortly after, followed another collection of miscellaneous poems, which showed more marked progress; in 1805, his tragedy of *Lucretia;* and in 1806, that of the *Hoekschen and Kabeljaauwschen*, or the Contest between the Nobility and the Towns in Holland, in the olden time—both original pieces of great merit.

In 1804, Loots carried off the first prize, and T. the second, for a poem on Hugo de Groot; and in 1806, the order was reversed, when both again sung the death of Counts Egmont and Hoorn. There flowed from his pen an uninterrupted series of songs and poems, in which the warmest feelings were expressed in the most natural and chaste language. Of these may be mentioned, as a few gems, 'William I.,' the 'Victory at Nieuwpoort, the 'Four Days' Naval Fight,' the 'Cry to Arms in 1815,' the 'Wintering of the Dutch in Nova Zembla,' and the 'National Song of the Netherlands,' which is an echo of the calm but patriotic spirit of the people. His deep fellow-feeling with his countrymen is seen in the poems which he wrote during the Belgian revolution in 1830—1831, as in the heart-stirring poems, 'The Evening Prayer,' and 'The General Prayer-day.' The popularity which T. attained, his poems reaching the fifth edition in 1831, arose chiefly from his singing of subjects always dear to the heart of the nation—of family-life, country, religion, and love—and that in simple, unartistic language, and pure Dutch style. The people loved the poet because they understood him, and his words touched their hearts. T. published *Romances, Ballads, and Legends* (1818); *New Poems* (1821—1829); *Songs of Claudius* (1832); *Poetical Flowers gathered from Neighboring Nations* (1839); *Scattered Poems* (1840); two volumes (1850), in which, though advanced in life, the tone of his lyre was more beautiful, powerful, and rich than ever. T. died at Rijswijk, October 21, 1856.

Of modern Dutch poets, T. stands in the first rank. The Wintering in Nova Zembla is the most wonderful piece of descriptive poetry in the Dutch language. T. was an excellent man, distinguished for his sincere piety and benevolence. His compassion for the poor comes out in his *Bedelbrief*, or Begging-letter, which he published for the benefit of the distressed in the severe winter of 1844—1845. While the people's poet, he was also God's priest for spreading Christian love among men. In early life, T. belonged to the Roman Catholic Church, and in 1827 joined the Protestant Remonstrants; but both before and after the change, he was essentially a religious man.

TOLO'SA, a town in the north of Spain, capital of the province of Guipuscoa, 15 miles south of the seaport of San Sebastian. It stands in a deep valley watered by two streams, and abounds in old family mansions. There is a royal factory for arms, and in the vicinity are zinc and lead mines. Pop. about 8000.

TOLU. See BALSAM.

TOLU'CA, a town of Mexico, capital of the state, and 20 m. S.-W. of the city of Mexico, about 8800 feet above the sea; is handsomely built; with fine arcades lining the streets. The plain on which it stands is fruitful in maize and other products. Pop. 12,000. Near the town is the volcano of the same name.

TO'MAHAWK, a light war-hatchet of the North American Indians. The early ones were rudely made of stone, ingeniously fastened to their handles by animal sinews, or cords of skin. European traders supplied hatchets of steel, the heads of which

Tomahawk.

were made hollow, for a tobacco-pipe; the handle of ash, with the pith removed, being the stem. These hatchets are used in the chase and in battle, not only in close combat, but by being thrown with a wonderful skill, so as always to strike the object aimed at with the edge of the instrument. The handles are curiously ornamented. In the figurative language of the Indians, to make peace, is to bury the tomahawk; to make war is to dig it up. The engraved figure of a tomahawk is from George Catlin.

TOMA'TO, or LOVE-APPLE (*Lycopersicum esculentum*), a plan of the natural order *Solanaceæ*, formerly ranked in the genus *Solanum*, and known as *S. Lycopersicum*. The genus *Lycopersicum* is distinguished by a 5—6-parted calyx, a wheel-shaped 5—6-cleft corolla, five stamens, and a 2—3-celled berry, with hairy seeds. The T. is an annual, from two to six feet in height, requiring support when tall. The leaves are unequally pinnate, the leaflets cut; the flowers numerous, followed by berries, which are very various in shape and color—generally red and yellow—in different varieties. The plant is a native of the tropical parts of America, but is now much cultivated in all parts of the world suitable for it, as the south of Europe and the United States. In Britain, it requires a hot-bed in spring. The fruit is much used for sauces, ketchup, preserves, confectionary, and pickles. The unripe fruit makes one of the best of pickles. Tomatoes appear with almost every dish in Italy. The use of them is rapidly increasing in Britain and other countries.

TOMB (Gr. *tymbos*), a monument erected over a grave, in order to mark the resting-place, and preserve the memory of the deceased. In early ages, and among eastern nations, it sometimes became the practice to place the remains of the dead in excavated sepulchres, whose interior was often decorated with painting or otherwise. Where the usage was to burn the dead, their bones and ashes were placed in urns in these receptacles. Some of the most remarkable rock-tombs were those of Egypt, belonging to the 18th and following dynasty of the Theban kings. The monarch's burial-place began to be excavated as soon as he ascended the throne, and the excavation went on year by year, the painting and decoration progressing till the king's death, when it was suddenly broken off, the tomb thus becoming an index both of the king's magnificence and of the length of his reign. The most costly articles are often found in these sepulchres. The decoration was almost entirely reserved for their interiors, the façades being comparatively unobtrusive. On the other hand, the rock-tombs of Persia and Lycia, less rich and elaborate internally, have imposing architectural façades, those of the Persian kings being copied from their palaces; and during the Roman period, this species of magnificence prevailed at Petra (q. v.) to an extent that gives that now deserted valley the aspect of a city of the dead. See also ETRURIA.

Tombs, in more modern times, have generally been mounds or masses of building raised over the remains of the dead. In the Homeric poems, heaps or cairns of stones are placed as honorary memorials above the graves of departed heroes. The Sepulchral Mound (q. v.) or tumulus of rude ages is found over the greater part of Northern Europe, and is probably older than the subterranean tomb. The Pyramids (q. v.) were the sepulchres of the Egyptian monarchs from the 4th to the 12th dynasty. The tombs of Greece, and still more those of the Greek colonies in Asia Minor, were sometimes pillars, or upright stone tablets, sometimes small buildings in the form of temples. The most celebrated was the *Mausoleum* (q. v.). The Roman tombs were not unfrequently important architectural structures, varying in form, but oftenest consisting of a circular tower resting on a square basement; familiar examples being the tomb of Cæcilia Metella, and the yet larger and more solid tomb of Hadrian, on the banks of the Tiber, best known as the Castel St. Angelo, which is about 220 feet in height, and of immense solidity. In Rome, Latium, and Magna Græcia, tombs were generally erected outside the tows, and along the principal roads leading into the country, as in the Via Appia at Rome, and the Street of Tombs at Pompeii. A form of excavated tomb, without external architecture, called *Columbarium* (q. v.), was also in use in Rome, whose walls were pierced with cells to receive cinerary urns. The prevalent circular tomb became in the later period of the Roman Empire polygonal; and the

central chamber, at first small, was gradually increased, till, in the age of Constantine, it became something like a miniature representation of the Pantheon, generally with a crypt below the principal apartment.

In the earlier centuries of Christianity, the burial of the dead in churches was prohibited. The first step which led to its adoption was the custom of erecting churches over the graves of martyrs; then followed the permission to kings and emperors to be buried in the church porch. The most important tombs of the middle ages are generally within churches or cloisters. There is much variety in the form and enrichment of medieval tombs. The earlier examples consist of a simple stone coffin, or sarcophagus, often with a low gabled lid and a sculptured cross. An altar-tomb, or tomb in the form of a table, followed; and in the 13th c., a species of tomb was introduced, consisting of a sarcophagus, on which rests a recumbent figure of the deceased, the whole being surmounted by a canopy, often of exquisite symmetry and richness. In the renaissance period of art, the tombs became more and more complex. The sarcophagus was disguised, or made the least important part of the monument; the representation of the deceased was confined to a medallion likeness, and the most prominent part of the tomb was composed of sculptured upholstery, and groups of symbolical and eventually mythological figures. In some of the 16th c. examples, as Michael Angelo's tombs of Giuliano and Lorenzo di Medici, at Florence, the inappropriateness of the design is partly redeemed by the beauty of the figures; but in the succeeding centuries, the vicious taste of these monuments rapidly increased, till it culminated in some of the hideous tombs that disfigure Westminster Abbey and St. Paul's.

TO'MBAC, or WHITE-COPPER, is an alloy formed of about 75 parts of copper and 25 parts of arsenic; it is used in the manufacture of buttons, and is a very beautiful metal.

TOMSK, a government of Western Siberia, bounded on the E. and N.-E. by the government of Enisei or Yeneseisk, and on the N.-W. and W. by that of Tobolsk. Area, 324,275 sq. m.; pop. (1879) 1,032,599. T., more than any other government of Siberia, abounds in lakes and rivers. Of the latter, most of which flow northward from the foot of the Altaï Mountains, the principal are the Ob, Tom, Chulim, and Irtish. The largest lakes, which are both sweet and brackish, occur in the Barabinsky Steppes. The climate is mild in the middle and southern districts, but severe in the north. Sandy and clayey soils prevail; but there are patches of good mould on which abundant crops of grain of various kinds, as well as hemp, flax, and tobacco, are raised. The extensive mountain-slopes and plains are covered with luxuriant forests, in which the most common trees are the broad-leafed oak, the cedar, and the pitch-tree. The natural products of the country are numerous. In the south and east parts, droves of wild horses and herds of horned cattle are a source of considerable wealth. But the mineral products of the country are its chief source of riches. Manufactures are not extensively carried on; there is a large barter-trade with China, and the commerce of the country is maintained for the most part by means of fairs.

TOMSK, a trading town of Siberia, capital of the government of the same name, on the Tom, a tributary of the Ob, 2809 miles east of St. Petersburg, in lat. 56° 30′ N., and long. 84° 58′ E. Situated on the great trading highway of Siberia, it is the seat of an important transit-trade, chiefly with the Kalmucks and Mongols; but the goods that pass to and from Irkutsk also go by way of this town. There are upwards of 50 manufactories, chiefly for soap, leather, and distilled liquors, and the most important commercial article is furs. It is said to be the richest town in Siberia; and its commercial importance, its extent, and the number of its handsome buildings, are increasing annually. A university is being instituted. Pop. in 1880, 33,795.

TON, a suffix of frequent occurrence in the names of Anglo-Saxon settlements. It seems to be from the same root as the Gothic *tains*, meaning a twig (allied to which are the *tine* of a fork, the *tines* of a stag's horns, the *tines* of a harrow), the Ang.-Sax. *tynan*, to hedge, and the Ger. *zaun*, a hedge. 'Hence, a *tun* or *ton* was a place surrounded by a hedge, or rudely fortified by a palisade. Originally, it meant only a single homestead or farm, and this use of it is still common in Scotland. In modern English, in the form of *town*, it is applied to a collection of houses. Similarly with *ton*, the terminations *worth*, *fold*, *garth*, *burgh*, and others also convey the notion of enclosure, protection.'—See I. Tayler's *Words and Places*.

TON, the same word as TUN (q. v.), denotes a weight of 20 hundred weight (*cwt.*). In Britain, the hundred-weight contains 112 lbs., so that the ton contains 2240 lbs. In the United States the hundred-weight is usually reckoned at 100 lbs., and the ton at 2000 lbs. In both countries, 40 cubic feet of rough or 50 of hewn timber constitute a ton or load of the same. The hundred-weight (*centner*) in Austria, Prussia, Denmark, Germany, and Switzerland, contains 100 lbs.; in Hamburg, 112; in Bremen, 116; its representative in France, Spain, and Portugal, is the Quintal (q. v.); in Italy, the Centinajo; in Turkey, Egypt, Northern Africa, and the Balearic Isles, the Kantar (124 lbs.).

TONE, in Music, the name given to the larger intervals in the diatonic scale, so called in contradistinction to the *Semitones* (q. v.), or smaller intervals. Theoretically, some of the intervals called tones are larger than others, and none of them are equal to two semitones; thus, in the scale of C, the intervals CD, FG, and AB, are all equal; but DE and GA, which are also called tones, are smaller; and the semitones, EF and BC, are larger than half even of the larger tones. In instruments, however, which are tuned according to the equal temperament (see TEMPERAMENT), all the tones are made equal, and each equivalent to two semitones.

TO'NGA BAY, a small inlet on the east coast of Africa, bounded on the N. by Cape Delgado, and extending inland in a north direction. Cocoa-nut trees and jungle line the shores of the bay, and at its head is the village of Tonga, small and insignificant, but important from its frontier position. Cape Delgado is the northern limit of the Portuguese colonnial possession of Mozambique; and the village of Tonga, which is situated north of the parallel of latitude of the Cape, is in the possession of the Seyyid of Zanzibar, and is the most southern possession of that sovereign.—*Despatches from Her Britannic Majesty's Consul and Political Agent, Zanibar*, 1863.

TONGA ISLANDS AND TONGATABU. See FRIENDLY ISLANDS.

TONGRES, a very ancient city of Belgium, in the province of Limbourg, 13 miles south-south-east of Hasselt. Its church of Notre Dame, the first dedicated to the Virgin north of the Alps, dates from 1240; and the cloister attached, the oldest in the country, was built in the 10th century. The mineral spring in the vicinity, of which Pliny wrote: '*Purgat* hic corpora, tertianas febres discutit, calculorumque vitia,' still retains its ancient virtues. Various manufactures are carried on. Pop. 7200.

TONGUE, THE, is a symmetrical muscular organ, extending from the hyoid bone backwards and downwards, to the lips in front, and occupying the buccal cavity. The superior surface, borders, and anterior third of the inferior surface, are free; while the remaining parts are attached to adjacent parts by the investing mucous membrane and subjacent structures. At certain points, this membrane, on leaving the tongue, forms distinct folds, containing fibrous or muscular tissue, which act to a certain extent as

The upper surface of the Tongue, showing the Papillæ:
1, the raphe or mesial line; 2, 2, the lateral parts; 3, the tip; 4, 4, the sides or edges; 5, 5, the V-shaped mass of circumvallate papillæ; 6, the foramen cæcum; 7, the mucous glands at the root of the tongue; 8, the epiglottis; 9, 9, 9, the fræna epiglottides; 10, 10, the greater horns of the hyoid bone.—From Sœmmering.

ligaments to the tongue. The most considerable of these folds is termed the *frænum* (or bridle) of the tongue, and connects its anterior free extremity with the lower jaw. It acts as a strong ligament, and limits the backward movement of the tip of the tongue. In rare cases, this ligament extends abnormally to the tip, so as to interfere with speech and mastication, and the child is said to be *tongue-tied*; recourse must be then had to division of the frænum, popularly known as *cutting the tongue*. Other folds of mucous membrane (the *glosso-epiglottid* folds) pass from the base of the tongue to the epiglottis; while from the sides of the base, passing to the soft palate, are seen two folds on either side, known as the *pillars of the fauces*. See PALATE. The *superior surface*

of the tongue is divided into two symmetrical lateral parts by a median longitudinal furrow, commencing at the tip, and extending back about two-thirds of the tongue's length. The various kinds of papillæ which are seen on their surface are described in the article TASTE, ORGAN AND SENSE OF. At the back of the surface, just behind the circumvallate papillæ, are large mucous glands, extending into long and capacious canals, and helping to secrete the fluid that moistens the tongue.

On the *inferior surface*, the longitudinal furrow, which extends from the tip to the frænum, is deeper than on the upper surface; on each side of it, veins are seen running forwards; and immediately beneath the tip is a cluster of mucous glands, known as the glands of Nuck (their discoverer in 1690). The *posterior extremity*, or *base* is flattened and extended laterally before it is inserted into the *hyoid bone* (known also as the *lingual* or *tongue bone*), which, with certain ligaments, must be regarded as the basis or framework of the tongue. The muscles of the tongue are usually divided into two groups—viz., the *extrinsic* muscles, which attach the tongue to certain fixed points external to it, and move it on them; and the *intrinsic* muscles, which pass from one part of the tongue to another, constitute its chief bulk, and move it on itself. These intrinsic muscular fibres run vertically, transversely, and longitudinally, and are so interlaced as mutually to support one another, and to act with the greatest advantage. By the action of the various muscles, the upper surface of the tongue may be made concave or convex, or may be pressed against the roof of the mouth; the tip may be protruded straight out or laterally, upwards and downwards, and to any recess (as, for instance, a hollow tooth) within the mouth where food might lodge; and the whole organ may be drawn back. The organ is freely supplied with blood, mainly by the lingual artery, which is given off by the external carotid. With regard to the nerves, the glosso-pharyngeal and certain branches of the third division of the fifth nerve are concerned in the special sense of Taste (q. v.); other branches of the fifth nerve are concerned in ordinary sensation, while the hypoglossal nerve on each side is the motor nerve of the tongue.

The various uses or functions of the tongue cannot be thoroughly understood without a brief reference to its comparative anatomy. The tongue in mammals does not differ very materially from that of man; but in general there is a close coincidence both in size and form between this organ and the lower jaw. In the rodents, the tongue has a wedge-like shape. In the giraffe and the ant-eater the tongue is much prolonged, being an important prehensile organ in the former; while in the latter, it is driven into ant-hills, and the victims are secured by its viscid secretion. In the feline races, the conical papillæ are converted into recurved spines of great size and strength, which the animal uses in scraping bones and in combing its fur. Except in mammals, the tongue is probably not an organ of taste. For a good description of the tongue in birds, reptiles, and fishes, the reader is referred to Professor Owen's *Anatomy of the Vertebrates*, vols. i. and ii. Amongst the Mollusca, the Gasteropoda are provided with a very singular apparatus known as the tongue, and consisting generally of a thin membrane, long and narrow, and rolled, except at its anterior extremity, into a tube. This membrane is covered on its upper surface with transverse rows of minute teeth, or more commonly with plates having tooth-like siliceous projections. These teeth present a great variety of patterns, which are constant in the different genera, and even characterize the species. Two eminent naturalists, Messrs. Loven, a Swede, and Troschel, a German, have independently made the teeth of the Mollusca a basis of classification. The Articulata do not present anything like a true tongue, although in insects a certain oval appendage is described as a *lingua*.

The functions of the tongue are gustation, prehension (in man and monkeys this function is supplied by the hand), mastication, insalivation, deglutition, and speech; to which may be added, spitting and whistling, and in the case of the Gasteropoda, the trituration of the food.

Amongst the diseases of the tongue may be mentioned INFLAMMATION or GLOSSITIS. The most marked characteristics of this affection are great swelling, tenderness, and difficulty in speaking and swallowing. It rarely occurs as an idiopathic or spontaneous affection, but often accompanies severe salivation. It must be treated by purgatives and low diet, and by gargling, as in ordinary Salivation (q. v.). Incisions are sometimes useful, both to relieve tension, and by the depletion that ensues. Cases occasionally occur in which the tongue suddenly enlarges to an immense size, so as almost to cause suffocation, without any true sign of inflammation.—See Druitt's Surgeon's *Vade-mecum*, 8th ed., p. 454, foot-note.

Hypertrophy, or *persistent enlargement* of the tongue, sometimes results from an imperfectly cured case of inflammation; but is probably in most cases congenital, although perhaps not noticed for a year or two. Bertholin (*Hist. Centur.* iii. p. 85) mentions the case of a male child born with the tongue protruding out of the mouth as large as a filbert; and as the child grew, the tongue increased to the size of a calf's heart. For a reference to various cases, and for the mode of treatment, we may refer to a Memoir by Dr. Humphry in vol. 36 of the *Medico-Chir. Transactions*. One of the most common forms of disease of the tongue is *ulceration*, which may arise (1) from the irritation of a decayed tooth with a sharp jagged edge; or (2) from constitutional syphilis; or (3) from a disordered condition of the digestive organs. In the first case, the tooth must be removed; in the second, iodide of potassium with sarsaparilla should be tried; and in the third, the complaint generally yields to regulation of the diet and of the digestive organs, and sedatives at bedtime. M. Lawrence recommends a mixture of compound decoction of sarsaparilla with compound decoction of aloes, three times a day, and four grains of extract of hyoscyamus at bedtime, with advantage. *Cancer* of the tongue occurs either in the hard or in the epithelial variety. There is a popular belief that this terrible disease may be excited by the irritation caused by a broken tooth, or by smoking a clay-pipe; but on comparing the prodigious numbers of jagged teeth and of clay-pipes with the rare cases of cancer of the tongue, we must at once reject this hypothesis. All that such sources of irritation can effect is to determine the exact seat of development of cancer in persons predisposed to it.

A typical case of epithelial cancer of the tongue occurred in the person of Professor Reid of St. Andrews, the eminent physiologist. In December 1847, his age being then 39, and his health good, he noticed a small ulcer on the right side of the tongue; it slowly extended, and acquired hard everted edges, but caused little inconvenience. In July 1848, it had attained the size of a five-shilling piece; its surface and edges were ragged, and it caused considerable pain, especially at night. A hard ridge could be felt all round the ulcer, and the glands beneath the jaw became enlarged. The health by the end of August had completely given way from the pain, when the diseased part of the tongue was removed by the late Sir William Fergusson. In less than a month, the wound had healed, and the health was re-established. In November, the enlarged glands were removed; but the disease returned in their scars, and spread till it caused death in July 1849. The only treatment which can be adopted with any chance of success is full and early extirpation. Prof. Syme succeeded in removing the whole organ, without even—strange to say—much affecting the patient's speech or power of deglutition. *Tongue-tie* is an affection for which infants are often brought to the surgeon, and which is often operated on when this might be dispensed with. The division of the *frænum* with a blunt-pointed pair of scissors, with their point directed downwards, is very easily performed, and fortunately does no harm to the child. Children who do not speak so soon or so clearly as is expected by their mothers, are always supposed to have tongue-tie.

TONGUES, GIFT OF, a gift of the apostles and other Christians in the first ages of the church. The main passages in the New Testament relating to it are Acts ii. 3—21; 1 Corinthians xii. 10, 28; xiii. 1, and particularly xiv. Allusions to it will also be found in Mark xvi. 17; Acts x. 46, and xix. 6. The only allusion to the possession of the gift in later times is in Irenæus, *Adv. Hær.* vi. 6: 'We have many brethren in the church having prophetical gifts, and by the Spirit speaking in all kinds of languages.' From these data, the following conclusions have been drawn by one of the most recent and intelligent expositors of the Epistles to the Corinthians. The gift in question is represented as something entirely new in the apostolical age: 'They shall speak with new tongues,' Mark xvi. 17. The effect on the spectators at the day of Pentecost is of universal astonishment. It is represented as a special mark of conversion, immediately preceding or following baptism. It is a gift 'of the Spirit': 'They began to speak with other tongues, as the Spirit gave them utterance'—Acts ii. 4. It was, moreover, closely connected with the gift of 'prophesying'—1 Corinthians xii. 10, 28; xiv. 1—6. It appears to be distinguished from prophesying by consisting not of direct warning, exhortation, or prediction, but of thanksgiving, praise, prayer, singing, and other expressions of devotion. It was an utterance of the heart and feelings, rather than of the understanding, so that the actual words and meaning were generally unintelligible to the bystanders, and sometimes to the speakers themselves: 'He that speaketh with a tongue speaketh *not to men, but to God;* for no one heareth; and in the Spirit he speaketh mysteries'—1 Corinthians xiv. 2, 4, &c. So far, the account of the gift seems intelligible.

It was, as Dean Stanley says, 'a trance or ecstacy, which in moments of great religious fervor, especially at the moment of conversion, seized the early believers; and this fervor vented itself in expressions of thanksgiving, in fragments of psalmody or hymnody, and prayer, which to the speaker himself conveyed an irresistible sense of communion with God; and to the bystanders, an impression of some extraordinary manifestation of power, but not necessarily any instruction or teaching, and sometimes even having the appearance of wild excitement, like that of madness or in-

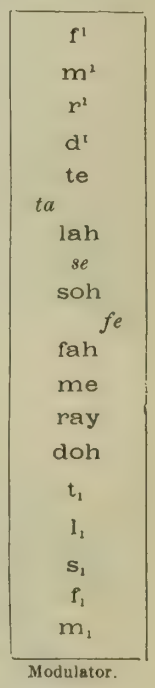
toxication.' The special difficulty, however, remains, viz., as to the character of intelligibility which, on one prominent occasion, seems to have belonged to the gift. *Glossa*, or the word translated 'tongue,' does not necessarily imply a distinct language of a people; this is usually expressed in the New Testament by *dialektos*. But in the description in the Acts ii. 6, 8, it is expressly said: 'Every man heard them in his *own language*' (*te idia dialekto*). 'How hear we every man in *his own language*' (the same phrase in the original) 'wherein we were born.' The plain meaning of this account seems to be, that the gift of tongues, on this occasion, at any rate, assumed the form of intelligible communications in foreign languages. But there is no evidence that the apostles then, or at any subsequent time, enjoyed the ability, supernaturally imparted, of speaking a variety of languages, with a view to the more adequate discharge of their apostolic functions, as has sometimes been inferred from the passage in the Acts. 'Probably,' it has been said, 'in no age of the world has such a gift been less needed. The chief sphere of the apostles must have been within the Roman Empire, and within that sphere, Greek or Latin, but especially Greek, must have been everywhere understood. Even on the day of Pentecost, the speech of Peter, by which the first great conversion was effected, seems to have been in Greek, which probably all the nations assembled would sufficiently understand; and the speaking of foreign dialects is nowhere alluded to by him as any part of the event which he is vindicating and describing.' Dean Stanley (*Corinth.* p. 250).

TONIC, or KEYNOTE, in Music, the note which forms the basis of any scale or key, and on which a piece of music written in that key naturally closes. See KEY.

TONI'CITY, MUSCULAR. The contractility of muscles shows itself under two distinct forms—*Irritability* and *Tonicity*, which are alike distinct in the mode of their action and in the conditions requisite for their exhibition. Irritability is most manifest in the voluntary muscles and in the heart, which, when in activity, exhibit powerful contractions alternating with relaxation; while Tonicity is shown in a moderate and permanent contraction, which, instead of being consequent upon stimulation through the nerves, as in irritability, is especially excited by change of temperature in the tissue itself, and is mainly shown in the involuntary or non-striated muscles. Like irritability, it is an inherent property of muscular tissue during life. 'It manifests itself,' says Dr. Carpenter, 'in the retraction which takes place in the ends of a living muscle when it is divided (as is seen in amputation); this retraction being permanent, and greater than that of a dead muscle. But its effects are much more remarkable in the non-striated form of muscular fibre; and are particularly evident in the contractile coat of the arteries, causing the almost entire obliteration of their tubes, when they are no longer distended with blood.' It is to the moderate action of the tonicity of arteries that their contraction upon the current of blood passing through them is due. If the tonicity be excessive, the pulse is hard and wiry; but if it be deficient, the pulse is very compressible, though bounding, and the flow of blood is retarded. From the experiments of John Hunter and many subsequent physiologists, it is established that *cold* is the most efficient agent in inducing tonic contraction; while the application of moderate warmth causes a relaxation of this contraction. Thus, cold and heat are of extreme value as remedial agents, when the tonicity of the blood-vessels is deficient or excessive.

TONICS are medicines which, in cases of want of *tone* or *tonicity* in the muscular fibres, are employed to restore strength and vigor to the system. Tonics, to a certain degree, are stimulants; but while the latter produce a rapid but transitory excitement, the former slowly induce a certain degree of excitement, and the effect is permanent. Most tonics, in which category we must place the shower-bath, cold sea-bathing, open-air exercise, friction, &c., as well as actual medicines of this class, act primarily through the nervous system (iron being, perhaps, the only exception); and secondarily produce their effects upon the muscular system at large. It is not only in general muscular debility that tonics are to be employed, but in all the numerous complaints which follow in its train, as palpitation, convulsions, epilepsy, chorea, neuralgia, and all forms of periodic disease. Amongst the chief medicines of this class are the dilute hydrochloric, nitric, nitro-hydrochloric, and phosphoric acids, various salts of bismuth, copper, iron, silver, and zinc, and various kinds of cinchona bark, with their alkaloids and their salts, cusparia, calumba, cascarilla, chiretta, gentian, quassia, salix, simaruba, and taraxacum. Although nux vomica and its alkaloid strychnine are placed by writers on Materia Medica amongst the 'special stimulants,' when given in very small doses they have a well-marked tonic action; and there is probably no tonic medicine of more general utility than the *Syrup of Iron, Quinine, and Strychnine*, a non-officinal but widely-used preparation, of which every drachm (the ordinary dose) contains $\frac{1}{25}$th of a grain of strychnine.

TONIC SOLFA. Various attempts have been made at different times to introduce a musical notation in which the staff with its lines and spaces is dispensed with. Jean Jacques Rousseau suggested, but afterwards discarded, a notation where the notes of the scale were indicated by the Arabic numerals. A system similar to Rousseau's in its leading features, called the Tonic Solfa, has, through the influence of its principal promoter, the Rev. John Curwen (who obtained his main principles from the writings and practice of Miss Glover of Norwich), been brought into use to a considerable extent in singing-schools in this country. It proceeds on the principle of giving the chief prominence to the fact, that there is in reality but one scale in music, which is raised or lowered according to the pitch of the key. The seven notes of the diatonic scale are represented by the Solfeggio (q. v.) syllables, or rather Miss Glover's modification of them—*Doh, Ray, Me, Fah, Soh, Lah, Te; Doh* standing for the keynote in whatever key the music is written. In the early exercises, the pupils are accustomed to a scale or diagram, called the Modulator, representing pictorially the exact intervals of a key, with the semitones in their proper places. In written music, only the initial letters of the solfeggio syllables are used—d, r, m, f, s, l, t; the higher octaves of a given note being distinguished by a ' above, as d^1, r^1; and the lower by a , or $_2$ below m_1, m_2. The name of the key is prefixed to a tune as its signature, as 'Key A,' 'Key B flat'—the keynote being, in all the major keys, *doh*. To indicate rhythm, a perpendicular line | precedes the stronger or louder accent, a colon : the softer accent, and where necessary, a shorter perpendicular line | the accent of medium force. Preparatory to writing the notes, the accent-marks are placed at equal distances along the page—thus, | : | : or : | : : | : : | : or | : | : | : | : A note immediately following an accent-mark, is supposed to occupy the time from that accent to the next—thus, | d : d : d | d : d : d | d, or | d : r | m : d.

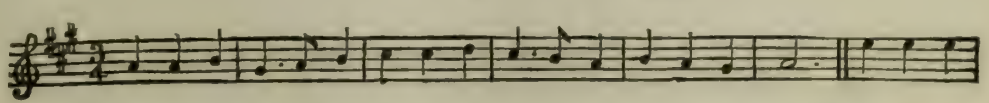


Modulator.

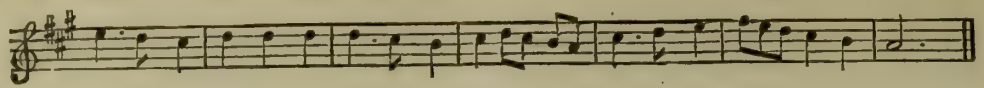
A horizontal line indicates the continuance of the previous note through another *aliquot* (the term used by Mr. Curwen for the distance of time between any accent and the next)—thus, d : — | d : d. A dot divides an aliquot into equal subdivisions, d : m.r | d. A dot after a mark of continuance indicates that the previous note is to be continued through half that aliquot—thus, | d :-. f | m : d.

A comma indicates that the note preceding it fills a quarter of the time from one accent to the next—thus, | d : r.m,f | ; a dot and comma together, three-quarters—thus, | f.,m : r.,d. An inverted comma ‚ is used to denote that the note preceding it fills one-third of the time from one accent to the next, thus, : d | s : l‚s‚f | m : r | d. An aliquot or part of it unfilled, indicates a rest or pause of the voice. A line below two or more notes signifies that they are to be sung to the same syllable. We subjoin an example of the tonic solfa shown alongside of the ordinary notation:

KEY A. GOD SAVE THE QUEEN.



| d :d :r | t_1 :-.d :r | m :m :f | m :-.r :d | r :d :t_1 | d:—:—|| s :s :s



| s :-.f : m | f :f :f | f :-.m :r | m:f.m :r . d | m :-.f :s | l, s, f :m :r | d :—:—||

In modulating into a new key, the note from which the transition is taken is indicated by a combination of the syllabic name which it has in the old key with that which it has in the new—*me lah*, for example, being conjoined into *m'lah;* and in writing this note, the initial letter of its syllable, as a member of the old key, is placed in small size before and above the initial of the syllable of the new, as ^{m}l, ^{d}s. In the case, however, of an accidental, where the transition is but momentary, a sharpened note changes its syllabic vowel into *e*, and a flattened note into *aw*, spelled *a*, as *fah, fe; soh, se; te, ta.* In the minor mode, *lah*, is the keynote; the sharp sixth is called *bah*, and the sharp seventh *se*. The signature of the key of A minor is 'Key C, minor mode.'

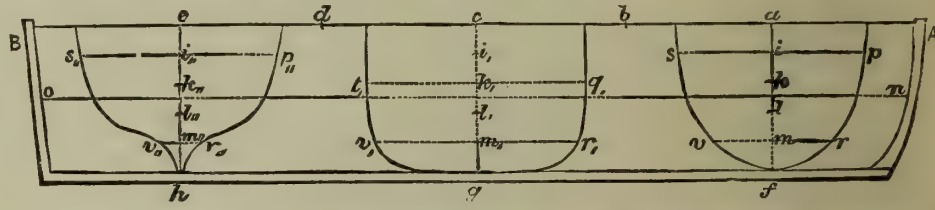
For a full explanation of this system see Curwen's *Grammar of Vocal Music*, or the periodical called the *Solfa Reporter*. The advocates of this notation maintain that it possesses advantages over the common system, particularly from the distinctness with which it indicates the keynote and the position of the semitones; the cheapness with which it is printed; and the manner in which, they say, it develops the proper mental effects of notes in key-relationship, and employs them in teaching. It has, however, been objected to by others, from its withdrawal of the direct indication of pitch to the eye which exists in the common notation, from its limited applicability to instrumental music, and from its acquirement not being, like that of the ordinary notation, an introduction to the world of musical literature.

TONKA BEAN, or TONGA BEAN, the seed of *Dipteryx odorata*, a large tree, of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, a native of Guiana, having pinnated leaves and axillary racemes of purplish flowers. The fruit is an oblong, dry, fibrous drupe, containing a single seed, which has a strong agreeable odor, owing to the Coumarin (q. v.) which it contains, and which is sometimes found crystallized between the cotyledons. Tonka beans are used for flavoring snuff, for which purpose one is carried in the snuff-box; and are put amongst clothes, to preserve them from insects, and to communicate an agreeable odor.

Tonka Bean.

TONNAGE, in regard to ships, is the measure of capacity, the ton being one not of weight, but of cubic content—i. e., 40 cubic feet. Very early in the history of navigation, some scale must have been established by which the relative capacity of different vessels could be determined. In England, there are early laws upon the subject, settling the data upon which the calculation should be made. The present system, called 'New Measurement,' dates from 1835; but the prior system, established in 1719, and now known as O. M. (Old Measurement), still subsists among yachts and some other vessels. The Old Measurement was greatly erroneous, for the actual depth of the ship was not taken into account, but was assumed to be equal to her breadth. The tonnage was then obtained by multiplying together length, breadth, and assumed depth in feet, and by dividing the product by 94. As harbor-dues and such-like taxes were levied according to each vessel's tonnage, it naturally followed under such a system that traders built their ships with as little beam and as great depth as they possibly could. The ships thus became highly dangerous in rough weather, and, moreover, every principle of correct naval architecture was set at nought, to produce deep wooden boxes capable of carrying a maximum of cargo with a minimum of beam. The absurdity of a law by which, in consequence of an inch more beam, a two-decked vessel might appear of greater capacity than a three-decked ship of like length, was so palpable, that many efforts were made at improvement. By the Act of 1835 (and the more perfect Merchant Shipping Act of 1854), the new system established the depth of hold as a necessary ingredient of the calculation. As, however, the section cross-wise of a ship varies so considerably at different points in her keel both in superficies and shape, more than an approximation to her cubic content cannot be obtained.

To arrive at this approximation, the total length of the upper deck, or, if the ship be not wholly devoted to cargo, of the upper portion of the space for cargo, is taken, and divided into 6 equal parts at the points *a, b, c, d, e*. From the foremost, center, and aftmost of these points, the depths to the bottom of the hold are measured as *af, cg, eh*. Each depth has to be divided into 5 equal parts; at the fore and after depth, the width inboard of the ship is measured at $\frac{1}{8}$th and $\frac{4}{8}$ths the depth from the top; and the center-depth at $\frac{2}{8}$ths and $\frac{4}{8}$ths from the top. These lateral measurements at i, i_u, k, m, m_u, and m_{uu}, are developed on the plan, and curves drawn representing cross sections of the ship at the given points. All dimensions are supposed to have been taken in feet and decimal parts, and they are thus used in computing the tonnage. The 'length,' *no*, is measured from stem (internal side) to stern-post, at half the height of the center-depth from the keel. To twice the depth amidships (*cg*), add the depths forward and aft (*af, eh*). The result is the 'sum of the depths.' Add together the two breadths taken at the foremost depth: of the breadths taken at the center-depth (*cg*), add together three times the breadth at $\frac{2}{8}$ths, and twice the breadth at $\frac{4}{8}$ths: of the after-breadths, add together the breadth at $\frac{1}{8}$th, and twice the breadth at $\frac{4}{8}$ths. The sum of these three totals is the 'sum of the breadths.' Having obtained these quantities, the tonnage is approximated to in a somewhat arbitrary manner by the following formula:



$$\text{Tonnage} = \frac{\text{Sum of depths} \times \text{sum of breadths} \times \text{length}}{3500};$$

or, if expressed in terms of the figure:

$$\text{Tonnage} = \frac{\{2cg + af + eh\} \{(ps + rv) + (3t_i q_i + 2r_i v_i) + (p_{uu} s_{uu} + 2r_{uu} v_{uu})\} \times no}{3500}.$$

In computing the measurement of a steamer, the same system is followed, but the tonnage of the engine-room (which is supposed to be capable of floating engines and boilers) is deducted from the total to express the tonnage of the ship.

TONNAGE (more properly TUNNAGE) AND POUNDAGE, certain duties on wine and other merchandise, which began to be levied in England in the reign of Edward III. They were at first granted to the crown by the vote of parliament for a limited number of years, and renewed on their expiry. The object of these imposts was said to be, that the king might have ready-money in case of a sudden emergency demanding it for the defence of the realm and the guarding of the sea. Originally fluctuating in amount, tonnage and poundage came to be fixed at 3*s.* on every ton of wine, and 5 per cent. on all goods imported. In the reign of Henry V., they were first conferred on the king for life; and the same course being followed with his successors, the sovereign began gradually to consider them as his proper right and inheritance, and the vote of parliament as but a formality expressive of the popular recognition of his prerogative. Though these duties were not voted to Henry VIII. until the sixth year of his reign, he, notwithstanding, levied them from the date of his accession; and parliament, in voting them, took occasion to blame those merchants who had neglected to make payment. It was, in fact, usual to levy these duties during the period intervening between a sovereign's accession and his first parliament, and this was done by Charles I., as by his predecessors. The Commons, however,

in Charles's first parliament, accorded these imposts not for life, but for a year only; and the House of Lords objecting to this departure from previous usages, and rejecting the bill, tonnage and poundage were attempted to be levied by the royal authority alone, a proceeding which raised the opposition of the Commons. Charles was, in 1629, induced to pass an act renouncing the power of levying these or any other imposts without parliamentary sanction. On the Restoration, Charles II. obtained a grant of tonnage and poundage for life; and the same course was followed on the accession of James II. and of William III.; but by three statutes of Anne and George I. these imposts were made perpetual, and mortgaged for the public debt. The Customs Consolidation Act in 1787 swept away tonnage and poundage, and similar charges, and substituted a new and single duty on each article See CUSTOMS DUTIES.

TONQUIN (better *Ton-kin* or *Tong-king*), a region in the north-east of the Indo-Chinese Peninsula, bordering on South China. It is mountainous in the north; but the greater part of its area is the fertile basin of the important river Song-ka or Songcoi. Formerly an independent state, it has been for more than one hundred years a dependency of Annam (see COCHIN-CHINA), forming its richest province. The French, moved by the hope of finding access into China by the head-streams of the Song-ka, have repeatedly intervened in the affairs of T.; and in 1874 forced the Annamese to recognize their protectorate over T., and open its ports to trade. To enforce this claim, France occupied the delta of the Song-ka in 1883, but met with difficulties; China insisting on its suzerainty over Annam, and still declining to recognize the treaty of 1874. The capital of T. is Hanoi, Ke-sho, or Cachao (q. v.).—The Gulf of T., lying between T. and the island of Hainan, is a branch of the China Sea, 300 miles long by 150 wide.

TONSILS. See PALATE.

TO'NSURE (Lat. *tonsura*, a shaving, from *tondeo*, I shave), a religious observance of the Roman Catholic and oriental churches, which consists in shaving or cutting the hair, as a sign of the dedication of the person to the special service of God, and commonly to the public ministry of religion. By some writers it is represented as of apostolic origin; but that it did not prevail in the early ages, is sufficiently plain. It would appear that the usage first arose in reference to the monastic rather than the clerical life. Paulinus of Nola, in the end of the 4th, or beginning of the 5th c., alludes to it as then in use among the western monks; and it speedily passed from them to the clergy, the crown-like figure being regarded partly as a symbol of our Lord's crown of thorns, partly as an emblem of the 'Royal Priesthood' of the Christian dispensation.

The form of the tonsure was different in different churches, and the varieties of it are of some historical interest. That of the Roman Church, called 'the tonsure of Peter,' consisted in shaving the crown as well as the back of the head, so that there remained a circular ring or 'crown' of hair. This was the form in use in Italy, Gaul, and Spain. In the 'Scottish (or Irish) tonsure,' which was in use in Ireland, in North Britain, and in those parts of Germany in which the Irish missionaries had preached, the entire front of the head was shaved, leaving the front bare as far back as the line from ear to ear. This tonsure was called 'the tonsure of James,' and sometimes of 'Simon the Magician.' The Greeks and other orientals shaved *the entire head*. The supposed derivation of the Irish form of tonsure from the apostolic times, led to its being held both in Ireland and in Britain, as well as other churches of Irish foundation, to be of the most vital importance, insomuch that the introduction of the Roman form was almost the occasion of a schism. Originally, the tonsure was merely a part of the ceremonial of initiation in orders, and was only performed in the act of administering the higher order; but about the 7th c., it came to be used as a distinct and independent ceremonial; and a question has been raised whether it is to be considered as itself an order, and to be added to the list of what are called the 'minor Orders' (q. v.). The now received opinion of Catholic writers is that tonsure is not an 'order,' but only a 'preparation for orders.'—See Wetzer and Welte's *Kirchen-lexicon*, art. 'Tonsur.'

TONTI'NE. This term is derived from the name of Tonti, a Neapolitan, who seems to have been the first propounder of a scheme for a financial association of which the prize or prizes were to accrue to the longest liver or livers. Generally, in an association on what is called the tontine principle, a payment is made by each member of the association, and with the capital so formed, an annuity, payable at the same rate until all the lives forming the association are extinct, is bought from some company or individual. This annuity is divided among the members according to age and premium paid by each; and on the decease of any member, the surplus thence arising is divided among the survivors; and on the death of the last member of the association, the total annuity reverts to the source from which it has hitherto emanated. There are, however, various kinds of tontines; and the designation of tontine may, with propriety, be applied to any financial scheme by which it is proposed that gain shall accrue to survivorship. In England, tontines have rarely been resorted to as measures of public finance. The last for which the government opened subscriptions was in 1789.—See Hamilton's *History of Public Revenue*, p. 210. Schemes on the tontine principle seem generally to be acceptable to the public, owing, probably, to the sort of sentimental faith which most persons have in their own prospects of longevity; and to the prudent desire for ease and affluence in old age. The application of the principle by Life Assurance Companies in their mode of distributing 'bonus,' or surplus profits, has long been a subject of controversy among these valuable institutions. It would be impossible here to go into the argument with any degree of nicety. It may, however, be broadly stated as follows:. A company formed for the purpose of life assurance means a company in which the members who are lucky in having long life, are to pay for those who are unlucky in dying prematurely. But over and above the net mathematical premium payable by each member of an assurance society, or by each person assured at the risk of a company, a percentage, or 'loading,' as it is technically called, is added, to cover expenses of management and other contingencies.

Where the funds of the company or society have been invested with average success, the loading is generally found, at the periodical actuarial investigations, to have been in excess of actual requirements; and the question then arises: How are 'profits,' or, in other words, the overcharges on premiums to be divided? The question is plainly one of great intricacy. The argument used by the offices favoring the younger policy-holders is, that those which favor the older are really acting on a tontine principle, which is the very converse of what ought to prevail in life assurance; on the other hand, it is said that the fulfilment of the insurance contract is provided for by the net premium, and that the distribution of over-payments, as 'profits' really are, is to be determined on principles wholly independent of insurance. See 'Notes on the Early History of Tontines,' by J. Hendricks, in the *Assurance Magazine* for July 1862; and an article in *Chambers's Journal*, 1880.

TOOKE, JOHN HORNE, a celebrated etymologist and political adventurer, was the son of John Horne, a London poulterer, and was born in that city, June 1736. He was educated first at Westminster and Eton, and afterwards at St. John's College, Cambridge, where he took the degree of B.A. in 1758. After spending some time as an usher in a school at Blackheath, he entered the church (to please his father, and strongly against his own wish), and in 1760, became curate at New Brentford. The disgust he entertained for the sacred profession led him to indulge (by way of revenge) in a license of speech and life, which appears to us to have fatally affected the honesty of his character. It is impossible, for instance, to read a passage like the following (from one of his letters to Wilkes), without feeling a deep distrust of the whole man: 'It is true I have suffered the infectious hand of a bishop to be waved over me; whose imposition, like the sop given to Judas, is only a signal for the devil to enter; but I hope I have escaped the contagion; and if have not, if you should at any time discover the *black* spot under the tongue, pray kindly assist me to conquer the prejudices of education and profession.'

When Wilkes (whose acquaintance he had made during a trip to Paris) stood as a candidate for the county of Middlesex, T. zealously aided him, pledging his credit for Wilkes' expenses, and declaring that, 'in a cause so just and holy, he would dye his black coat red;' but he afterwards quarreled with his dubious associate, and in 1770—1771, the two had a rasping epistolary controversy, which appears to have hugely gratified their enemies. He still, however, continued to meddle in political affairs, and even ventured to encounter (not without success) the formidable Junius. In 1773, he resigned his living at New Brentford, and commenced the study of law, a profession in which he was really fitted by nature to excel. About this time, he rendered some important private service to a Mr. Tooke of Purley in Surrey, who designed to make him his heir, but altered his mind, and only left him a legacy of £500. Altogether, however, he is said to have received from this gentleman about £8000, and, in consequence, adopted the surname of Tooke, by which he is now known. In 1775, he was fined and imprisoned in the King's Bench for publishing an advertisement in which he accused the king's troops of barbarously murdering the Americans at Lexington. While in prison, he penned his celebrated *Letter to Mr. Dunning*, in which are to be found the germs of his *Diversions of Purley*. It excited a good deal of attention at the time, and even Dr. Johnson, who detested T.'s political sentiments, expressed his intention—should he publish a new edition of his *Dictionary*—to adopt several of the 'dog's' etymologies. On his release from confinement, T. made an attempt to gain admission to the bar, but was refused, on the ground of his clerical orders. Soon after, he reverted to political writing, at once the pleasure and the poison of his life, and in a

Letter on Parliamentary Reform, advocated universal suffrage. In the struggle between Pitt and Fox, he pamphleteered on the side of the former, but soon got to hate Pitt too, as he had learned to hate most other public men.

In 1786, appeared his famous *Epea Pteroenta, or the Diversions of Purley*, a work on the analysis and etymology of English words, which, amid much that is erroneous, both in principle and detail, contains still more that is acute, original, and true. In particular, he has demonstrated, says a *Quarterly Reviewer* (No. 14), that 'all words, even those that are expressions of the nicest operations of our minds, were originally borrowed from the objects of external perception.' See PHILOLOGY. But T.'s passion for politics soon drew him from the calm pursuit of literature into the vortex of public life. In 1790, and again in 1796, he stood as a candidate for Westminster, but was unsuccessful on both occasions. At length, in 1801, the great enemy of rotten boroughs entered parliament for the most notorious rotten borough in England—Old Sarum; but he made no figure there. He died at Wimbledon, March 19, 1812. T. was never married, but had several natural children, to whom he left his property. The best edition of the *Diversions of Purley* is that of Taylor (Lond. 1840).

TOOMBU'DRA (correctly, TUNGA-BHADRO), an important tributary of the Kistnah or Krishna, rises in the south-west of Maisur (Mysore), and after a north-east course of from 350 to 400 miles, joins the Kistnah, 25 miles below Karnul.

TOON, or TOONA (*Cedrela Toona*), a tree of the natural order *Cedrelaceæ*, one of the largest timber trees of India. Dr. Hooker mentions one which he measured which was 30 feet in girth at five feet above the ground. The leaves are pinnate, the flowers small, in panicles, with a honey-like smell, the petals erect, and approaching each other so as to form a sort of tube. The tree ascends to the height of 4000 feet on the Himalaya Mountains, and is found to the furthest south of the East Indies. It is sometimes called *Bastard Cedar*. The wood is soft, but is used for furniture. The bark is a powerful astringent, and is used in dysentery, diarrhœa, &c.

TOOTHACHE. See TEETH.

TOOTHACHE-TREE. See ARALIA and XANTHOXYLUM.

TOOTH-ORNAMENT, much used in the Early English style.

TOP, in a Ship, is the platform at the head of each lower-mast. It is supported on the trestle-trees and cross-trees, and serves to give a wider base to the top-mast shrouds. It is also used for working the upper sails. In a well-ordered ship, there is a captain and crew for each top. Formerly, in vessels of war, the top was fortified with hammocks all around, and in action was made to do duty as a sort of redoubt, whence a fire of small-arms, or even light swivel-guns, was poured upon the deck of the enemy.

TO'PAZ, a mineral, ranked by mineralogists amongst Gems (q. v.), and the finer varieties of which are much valued both for their lustre and the beauty of their colors. It is composed chiefly of alumina and silica, the former, in general, more than 50 per cent of the whole, with fluoric acid, and usually a little oxide of iron. It is found generally in primitive rocks, and in many parts of the world. A crystal 19 ounces in weight was found in the Cairngorm Mountains in Aberdeenshire, Scotland; and fine topazes are sometimes found in that part of Scotland, in Cornwall and in the Mourne Mountains in Ireland. Fine topazes are found in Ceylon, but those most prized by jewelers are generally from Brazil. The finer varieties of T. are in general found either crystallized, or as small rolled masses, which may have been formed from crystals, in alluvial soil.

T. is either colorless, or red, blue, green, or yellow, in great variety of shades. Its crystals are rhombic prisms, generally terminated by four-sided pyramids, but often variously beveled and acuminated. The prisms are finely striated. The cleavage parallel to the base of the prism is easy. The specific gravity is about 3·5. The lustre is vitreous. T. is translucent or almost transparent on the edges. It is harder than quartz. It is rendered very electric by heat or friction, and by this property a T. may at once be distinguished from a diamond or ruby, for which otherwise, when cut and set, it might readily be mistaken. A coarse variety of T., called *Pyrophysalite*, occurs near Fahlun, in Sweden, which is not crystallized. It is greenish white. When reduced to powder, it can be used as emery for grinding and polishing.—T. derives its name from the *Topazion* of the ancients, which, however, seems to have been a totally different mineral.

TOPE (*Galeus canis*), a small species of shark, of the family *Galeïdæ*, which has two dorsal fins and one anal, spout-holes, and the eyes furnished with a nictitating membrane, the first dorsal situated over the space between the pectorals and ventrals. The T. is very abundant on the southern coasts of Britain, but becomes more rare towards the north. The name T. is said to be originally Cornish. Other local names are *Miller's Dog* and *Penny Dog*. It attains a length of about six feet. The T. is extremely troublesome to fishermen, robbing their lines of the fish which are attached to them, and biting off the hooks, or, if it happens to be

Tope (*Galeus canis*).

itself hooked, often winding the line round its body in many coils and with tangled knots.

TOPE is the vernacular name of Buddhistic monuments intended for the preservation of relics. In Ceylon and elsewhere, they are also called *Dagops;* and another of their designations is *Chaitya*. The difference between these terms results from their meaning. Tope is the Pâli *thûpa*, and the Sanscrit *stûpa;* it means therefore literally 'accumulation,' and conveys a sense analagous to that of the Latin *tumulus*. *Dagop* is a corruption of *dhâtu-gopa*, i. e., relic-preserver; and *Chaitya* applies generally to objects of worship, as images, temples, sacred trees, &c. *Tope* is therefore the name of those monuments in regard to their shape; *Dagop*, in regard to their purpose; and *Chaitya* the general term. Though the shape of the topes underwent many changes according to time and locality, it is possible to distinguish its oldest type from its later development. The oldest topes are in the shape of cupolas, generally spherical, but sometimes elliptical, resting on a cylindrical or quadrangular, or polygonal base, which rises either in a straight or inclined line, or in terraces. The top of the cupola, surrounded by a balcony of pillars of a peculiar kind, is crowned by a structure generally quadrangular, but sometimes in the shape of a reversed pyramid of a few steps; and over this structure is a roof in the shape of an extended parasol (Sanscrit, *chhattra;* in Pâli, *chatta*). This was the form, for instance, of the topes of Sanchi, of the dagops of Ceylon, and the oldest monuments of this kind in the Punjab and Afghanistan; though in most of them the parasol, being of wood, is either completely destroyed, or merely recognizable in its fragmentary condition (see art. BUDDHISM, where, in the section of the cave-temple at Karli, the tope is seen still surmounted by the wooden umbrella). The cupola was sometimes ornamented with more than one parasol; in some of the topes of Sanchi there are three, and even five parasols side by side, the middle one exceeding the rest in height.

The different arrangement of these parasols, especially when their number increased, led to a different shape of the topes, such

Fig. 1.—View of principal Sanchi Tope.
(From Fergusson's *Hand-book of Architecture.*)

as occurs, for instance, in China and Tibet. This arrangement consists in placing them one *over* the other; and not only three or five, but even seven, nine, or more are so placed. The height of the structure thus became naturally greater than it originally was, and the topes, instead of having the character of cupolas, now assumed that of pyramids resting on a cupola base, the parasols gradually giving way to a real pyramidal form. In some monuments of this class, however, the cupola was placed above, when the base consists in round or quadrangular towers rising in a spiral form, or in several stories. The Chinese, on the contrary, rejected the cupola altogether, and merely retained the succession of parasols extended one over the other, converting them into a many-storied tower; and the same is the case with the topes of the Mongols, the *Ssuvurghans*, which are pyramids erected on a low quadrangular base. The top of the pyramidal topes always carries some metal ornament, frequently gilt, resembling a parasol, or a needle, or a trident, or a rising flame. The height of these buildings varies from a few feet to 300, and even more; there are also topes of a few inches only, but they serve merely as orna-

ments in temples or buildings, or as symbols of the real topes. If erected in cave-temples, the tope generally stands at the end of a long hall especially cut out for it, but sometimes also in the sanctuary of the cave-temple itself; if erected over-ground, it stands always in the vicinity of a temple or convent.

Fig. 2.
Rock-cut Tope at Ajunta (from Fergusson), in which the three umbrellas have become a spire.

In the interior of the tope is the cell or chamber (*dhâtugarbha*) where the box containing the relics and 'the seven precious things' was placed. This cell consists of six slabs of stone, firmly closed after the box with the relics, &c. had been placed in it; and it was immured into the tope after its structure had, in the course of building, attained a certain height; the building then being brought to its completion, so that the cell enshrining the relic was enclosed on all sides with solid brickwork. The 'seven precious things' referred to, with which the relics were ornamented, are differently enumerated; according to one account, they are gold, silver, lapis lazuli, crystal, red pearl, diamond, and coral; others mention ruby and emerald; and others, again, omit gold and silver. In several cells which have been opened, the box contained, besides the relics, precious stones of various kinds, golden ornaments, and coins; and the box itself generally consisted of an outer casement of stone, clay, or bronze, which enclosed a silver cylinder, and within this, a golden cylinder, which was the real receptacle of the relics. Both cylinders had generally a convex lid, representing the shape of the cupola, and the box exhibited inscriptions commemorating the name of the saint to whom the ashes or other relics contained in it had belonged. It seems that there are also topes which had the relics placed, not within, but under them—or, in other words, in the ground on which they were erected; for, in some which were opened, neither a cell nor any relic was found; and though it is possible that such monuments were merely erected in commemoration of some personage, there are, on the other hand, accounts which relate that relics were also placed under the dagops. Whether these accounts be correct, it is at present impossible to say, as no foundation on which such dagops stand has as yet been explored.

It has been supposed by some authors that the topes contained some secret passage leading to the relic-cell, known only to the priests or the initiated, who thus might gain access to the relics; for legends relate that during night such relics occasionally shed light, and that some pious king was deigned worthy of being favored with their sight; but none of the topes hitherto explored —and some of these are of the greatest dimensions—yielded any confirmation of this theory; they proved to be nothing but solid masses of brick and stone, without any chambers or passages—merely containing the relic cell, of generally one foot in diameter. That the cupola of the topes was intended to represent the water-bubble, the Buddhistic symbol of the hollowness and perishability of the world, is borne out by a legend in the *Mahâvans'a* (q. v.). The purport of the parasol may seem more doubtful; but as the parasol is the emblem of Hindu royalty, and as S'âkyamuni, himself the son of a king, replied to the question how he wished to be buried, by answering: 'Like an emperor,' it is not unlikely that the parasol of the topes was intended to imply the royal dignity possessed by a Buddhistic saint. When the topes became pyramids or towers consisting of terraces and stories, the number of the latter had likewise a symbolical import. Thus, only the topes of the most accomplished Buddhas had thirteen terraces; three terraces imply the three worlds; five, the five steps of Mount Meru; and so on.

TOPEKA, the capital of the State of Kansas, U. S., on both banks of the Kansas River. It is very handsomely built, and the state capitol is a magnificent edifice. T. is connected by rail with the ports of the Gulf of Mexico, and by the Atchison, Topeka, and Santa Fe (Southern Pacific), completed in 1882, with San Francisco. T., incorporated in 1857, and made state capital in 1861, had 5790 inhabitants in 1871, and 15,451 in 1881.

TOP-GALLANT, in a Ship, the name applied to the third mast or sail above the deck, i. e., to the mast and sail above the topmast and topsail.

TO'PHANÉ (correctly, TOP-HANEH), a suburb of Constantinople (q. v.).

TOPICS (the Greek term *topike*, from *topos*, a place) was the name given by the Greek and Roman rhetoricians and grammarians to the art of discovering arguments. It consisted in the eliciting out of the series of particulars certain general conceptions and propositions, which, in the elaboration of oratorical discourses, served as guides in the invention and choice of suitable arguments. Any one such general conception was called in Greek *topos;* in Latin *locus communis* (a 'common place'). The Greeks bestowed much attention on this art; among the Romans, Cicero composed *Topica*, and various other treatises of a kindred nature. During the middle ages, it was proposed to apply it to the whole circle of human knowledge, and even to the solution of the most difficult intellectual problems; but in general, these efforts only resulted in empty exhibitions of mental vivacity (*jeux d'esprit*); and in modern times, the so-called 'art' has sunk so low, that by the term 'topic' one understands nothing more than a theme or subject for discussion and talk.

TOPKNOT, the popular name of some small fishes of the same genus with the Turbot (q. v.) and brill. MULLER'S T. (*Rhombus hirtus*) is not uncommon on some parts of the British coast, particularly the west coast of England. BLOCH'S T. (*R. punctatus*) is more plentiful in more northern parts. They are very similar, brown and mottled with very dark brown or black on the upper surface, white below. They live among rocks, where they are not easily distinguished by the eye from the sea-weed. Although very delicate fish, they are little regarded, the largest being seldom more than 7 or 8 inches in length. The breadth is about half the length.

TO'PLITZ, or TEPLITZ, a watering-place of Bohemia, one of the most celebrated of the German spas, is pleasantly situated on the Saubach (Pig's Stream), 16 miles north-west of Leitmeritz. The chief building is the palace of Prince Clary, to whom the town in great part belongs; and behind this building are a park and gardens which are the principal places of resort. Within their limits are the theater and the Gartensaal, the latter of which serves the purposes of reading, dining, and ball room. On the hill behind the palace is the Schalckenburg, a sort of tavern, built in imitation of a castle, and which commands a wide view from its prospect-tower. The baths are supplied from 11 hot alkalo-saline springs, the chief of which has a temperature of 120° F. They are taken exceedingly hot, and have great virtue in restoring persons afflicted with gout, rheumatism, &c. Pop. of T., with Schönau, (1880) 16,750. Between 7000 and 8000 strangers annually visit the baths.

TOPO'GRAPHY is literally a description of places (Gr. *topos*, a place), as rivers, hills, woods, but more especially cities, roads, bridges, streets, and even particular buildings. It differs from ordinary geography only in being more special and minute. The copious topographical literature of Great Britain will be found carefully indexed in a special work, Anderson's *British Topography* (1881), which is a catalogue of works on this subject in the British Museum.

TOPOGRAPHY, MILITARY. Among the first necessities of a military commander is a thorough knowledge of the physical conformation, the obstacles, and the resources of the country in which he has to operate. It frequently happens that the field of warfare is one of which no careful survey is procurable. It devolves, then, on the officers of the staff to make their chief acquainted with all the particulars he requires; hence, topographical drawing is made a principal ingredient in the course of study at the Staff College. These surveys devolve, in the field, on the quarter-master-general's department. An officer of this service is ex-

pected to traverse a country with rapidity, to measure distances by eye or intuition, to note them roughly down as he rides, to obtain a rough knowledge of hills and valleys, of roads and ravines, rivers and the means of crossing them. He must at the same time make himself acquainted with the means of sustenance produced by the country, with the feelings of the people—whether friendly or hostile—with the transport which can be drawn from the villages, with the position and strength of fortified places, and, in short, with every particular which can be of service to his commandant. His reconnaissance finished, not without fatigue and danger, he is expected to sit down and produce an eye-map, or a full report of all he has seen and heard.

The *Topographical Department* is a department of the War Office under the 'Director of Surveys,' who is an officer of engineers. It comprises the 'Ordnance Survey,' which is charged with the various national surveys; and the Topographical Dépôt, a collection of maps, plans, descriptive-books, and journals of staff-officers from all parts of the globe. The officers of this dépôt always try to keep their information posted up to the latest date, that, on an army taking the field, the general may at once be put in possession of a competent knowledge of the country he is to pass through or occupy.

TOP-SHELL. See TROCHIDÆ.

TOR (Celtic), 'a projecting rock, is found in the names of Mount Taurus and the Tors of Devonshire (Yes Tor, Brent Tor, &c.) and Derbyshire (Mam Tor, Chee Tor, &c.). The higher summits of the *Tyr*-ol are called Die *Taur*-en.'—Taylor's *Words and Places*.

TORBANEHILL MINERAL, a name sometimes popularly given to a mineral substance also known as BOGHEAD COAL, found on the lands of Boghead and Torbanehill, near Bathgate, Scotland, and celebrated for its value as a source of Paraffin Oil or Naphtha (q. v.), of which it yields a much greater quantity than any other coal or shale found in Britain. Large quantities are exported to the continent of Europe. A famous litigation took place in 1853 concerning this mineral, between a landlord and the lessees, which turned partly on the question, whether it ought to be regarded as a coal or a shale, a point on which opposite opinions were expressed by eminent men of science.

TORCE, or WREATH, in Heraldry, a garland of twisted silk, by which the crest is joined to the helmet. A crest is always understood to be placed on a torce, unless where it is expressly stated to issue out of a coronet or chapeau.

TO'RGAU, a town of Prussia, and a fortress of the second rank, stands on the left bank of the Elbe, 70 miles south-south-west of Berlin, and 12 miles north of the frontier of the kingdom of Saxony. The river is here crossed by a bridge 500 paces in length, and supported upon 15 stone piers. Among the public buildings are the castle, now used as a barrack and magazine, and comprising a church consecrated by Luther in 1544; a town-church, with pictures by Cranach; a gymnasium, and other schools. Weaving and brewing were once briskly carried on at T., but the prosperity of the town has decayed. A battle was fought here in November 1760, in which Frederick II. of Prussia defeated the Austrians. Pop. (1880) 11,091.

TO'RGET, a small island off the north-west coast of Norway, in lat. 65° 30′ N. It serves as a land-mark to sailors, is the haunt of numerous water-fowl, but is chiefly noteworthy for its lofty rock called Torghatten (the Hat of Torget), which rises to the height of 756 feet above sea-level, and is pierced right through, near the top, by a cave or passage 80 feet wide, and 1300 feet long.

TORLONIA, a princely Roman family, remarkable for their wealth, and for their extraordinarily sudden rise from the very lowest condition, trace their origin to a poor 'cicerone,' Giovanni T. (born in 1754), who hung about the Piazza di Spagna in Rome, and gained a precarious living by showing visitors over the Colosseum. By steadiness and honesty, he obtained a reputation in his profession, became afterwards an agent of the French emissaries who were sent to excite the Roman populace to revolution, and on the failure of this project was left with considerable funds in his hands; he afterwards married a widow of means, and became a merchant, gradually rising, by dint of great intelligence, keen foresight, and enterprise, to the position of a stockbroker, usurer, and money-dealer; and by acquiring mortgages over the properties of the impoverished Roman princes, and by various other happy ventures, ultimately amassed an immense fortune. He was made a grandee of Spain, and Duke of Bracciano by the pope. His three sons allied themselves with princely families of the highest rank; the eldest succeeded to the dukedom, and the two others carried on their father's business. The youngest became Prince of Civitella-Cesi, and Duke of Ceri.

TO'RMENTIL (*Tormentilla*), a genus of plants of the natural order *Rosaceæ*, sub-order *Potentilleæ*, differing from *Potentilla* (q. v.) only in the 4-parted calyx and corolla, and now united with it by many botanists. The COMMON T. (*T. officinalis*, or *Potentilla tormentilla*) is a very common plant in moorish and heathy places in Britain and throughout great part of Europe. It has a large woody root, which has long been officinal, being an agreeable and efficacious astringent, useful in diarrhœa and other

Tormentil (*Potentilla tormentilla*).

complaints; and which contains tannin, gum, and a red coloring matter, not soluble in water, used by the Laplanders for staining leather red. The leaves are ternate, the leaflets lanceolate, and inciso-serrate; the stems ascending and forking, the flower-stalks axillary and terminal, and the flowers yellow.

TO'RMINA is the technical term for *griping* pains in the belly.

TORNA'DO. See WHIRLWIND.

TO'RNEA, a river, important as forming part of the boundary-line between Russia and Sweden, rises in Lake Tornea, in Sweden, and flows south-east and south between Russia and Sweden, entering the Gulf of Bothnia at its northern extremity, after a course of 250 miles. At its mouth is the small town of Tornea (q. v.).

TORNEA, a town in Finland, situated in 65° 50′ N. lat., and 24° 10′ E. long., on the peninsula of Svensar, at the mouth of the Tornea, in the government of Uleaborg. The pop., which in 1880 was 968, is principally engaged in the exchange-trade with the more northern and scantily-inhabited districts of Finland and Sweden, of which T. is the active center, as the most northerly town in the Russian Empire; deals, salt-fish, tar, hemp, rein-deer skins and other peltries being brought to T., to be exchanged for tobacco, spirits, manufactured goods, &c. T. is often visited in summer by travelers, anxious to witness the singular spectacle of the sun remaining above the horizon both night and day at the summer solstice. T. was several times taken by the Russians from Sweden before its final cession at the Peace of Frederickshamm, in 1809, when it was ceded, together with the whole of Western Finland, to Russia.

TO'RO, or TORRO, an ancient but decayed town of Spain, in the modern province of Zamora, stands on the right bank of the Douro, 21 miles east of Zamora. It contains numerous religious houses, most of which have been allowed to fall into a state of decay; there are brandy-distilleries and brick and tile works. Pop. 7000.

TORO'NTO, the capital city of the province of Ontario, Canada stands on the north shore of Lake Ontario, in lat. 43° 39′ N., long. 79° 23′ W., 165 miles from Kingston, and 323 miles from Montreal. It is over two miles in length between east and west, is bounded on the S. by the Bay of Toronto, a spacious inlet of Lake Ontario, and is a mile and a half broad from south to north. The scenery of the vicinity is somewhat tame, and the situation of the town is low and flat, the most elevated quarter—the Queen's Park, in the west, containing the university, observatory, and handsome private residences—being only from 100 to 200 feet above the level of the lake. The harbor or bay, about five miles long and a mile in width, is formed by a curving spit of land running into the lake in a south and west direction to the distance of three miles. It is capable of accommodating the largest vessels that navigate the lakes, and is defended at the entrance by a fort, which was thoroughly repaired in 1864 by the imperial government, and mounted with the most efficient modern ordnance. T. has much the appearance of an English town, and is distinguished for the number of its churches—many of which are surmounted by handsome spires. The principal are St. James's Cathedral (Anglican), a noble edifice in Early English, erected in 1852; St. Michael's Cathedral (Roman Catholic); Knox's Church and St. Andrew's (Presbyterian); the Metropolitan (Methodist); and the Unitarian chapel. T. is the fountain-head of the Canada school-system, and its educational institutions are numerous and well appointed. The university, charmingly situated in the well-wooded Queen's Park, was inaugurated in 1843, and is attended by 250 students; Trinity College has about 100 students; and the

Upper Canada College has 200. Knox's College, recently built, is the Presbyterian theological hall. The University Park, with its beautiful monument to the volunteers who fell at Ridgeway, and the Horticultural Gardens, are frequented by all classes of the community. There are also the Normal and Model Schools, in the first of which teachers exclusively are trained. Attached to the university is the observatory. There are many benevolent institutions, as hospitals, asylums, &c.; and handsome official buildings, including Osgood Hall, the seat of the supreme courts of the province; the legislative buildings; the Government House; the customs-house; and the post office.

There are two large theaters in T. T. is a station for five railways—the Grand Trunk, running east and west; the Great Western; the Northern; the Toronto, Grey, and Bruce; and the Toronto and Nipissing; while, during open navigation, magnificent steamers ply in all directions on the lake. Cabinet-ware and iron rails are manufactured, and foundries, distilleries, and flour-mills are in operation; the exports are manufactured lumber, flour, wheat. Pop. (1871) 56,092; (1881) 86,415, who return two members to the provincial parliament.

The name T. is supposed to be of Indian origin, but the meaning of the word appears to have been lost. The town was founded in 1794 by Governor Simcoe. It was incorporated in 1834, was burned by the Americans in 1813, and suffered severely in the insurrection of 1837, on which occasion it was the headquarters of the rebellion, as also from fire in 1849.

TORPE'DO, a genus of fishes of the order *Raiiæ* (see RAY), and family *Torpedinidæ*. All the *Torpedinidæ* were formerly included in this genus, itself originally formed from *Raia;* but it has been divided into a number of genera, as *Torpedo*, *Narcine*, *Astrape*, &c. The *Torpedinidæ* have a short and not very thick tail, cylindrical towards the end, keeled on the sides. The disc is rounded,

Torpedo (*Torpedo vulgaris*).

and has neither scales nor prickles. The most remarkable characteristic, however, is the galvanic battery, which all the species possess, and which is described and figured in the article ELECTRICITY, ANIMAL. The name T. is very commonly extended in a popular sense to all the *Torpedinidæ*. Two species of T. are occasionally found on the southern coasts of England—*T. vulgaris* or *marmorata*, which sometimes attains a large size, weighing 100 lbs.; and *T. Nobiliana*, which is apparently more rare. They are readily distinguished by the spiracles behind the eyes, which are round and fringed at the edges in the former, oval and perfectly smooth in the latter. These and other species are found more plentifully in the Mediterranean, and the *Torpedinidæ* generally belong to the warmer seas. The popular names *Numb-fish*, *Cramp-fish* and *Cramp Ray* are given to torpedoes by English fishermen. The electric shock which a large T. gives when seized is so severe, that no one who has experienced it desires to experience it again.

TORPEDO. During the war between Great Britain and the United States in 1812—1814, this name was applied to certain mysterious boats invented by Fulton and other Americans for the purpose of navigating beneath the surface of the water, and injuring the bottoms of hostile vessels. In those days of hand-to-hand naval war, these designs (which, by the way, were failures) were looked upon as little less than diabolical. The progress of destructive weapons during half a century has removed this aversion. The modern torpedo is of two kinds—first, the locomotive torpedo, which is in various ways projected against the side of a hostile vessel; secondly, the fixed torpedo, a kind of stationary bomb-shell intended to explode under the bottom of the enemy's ship. To these fixed torpedoes it is now more usual to give the appropriate name of submarine mines.

The weapon was first used by the Russians in the Baltic in 1854; but in the American War of Secession of 1861—1865 it was extensively and often successfully employed. The damage effected by a torpedo exploding beneath a ship is very great, but the failures are very frequent by the explosion happening at a wrong moment. In the Franco-German War of 1870—1871, the French fleet was effectually scared from the Prussian ports by the dread of torpedoes. Torpedoes were much employed in the Russo-Turkish war of 1877.

Of fixed submarine mines there are two classes—those which are self-explosive on a ship touching them, and those which are dependent on an electric current supplied from the shore. A torpedo of the self-acting class is shown in fig. 1: *abc* is a hollow iron cone, water-tight, with a ring at *b* by which to anchor it. The upper part, B, is left empty, for the sake of buoyancy, while the lower end, A, is filled with gunpowder, the charge varying from 100 to 300 lbs. At the top of the powder is an iron case, C, filled with lime, and in it a tube of thin glass, D, containing sulphuric acid. The upper part of the glass tube is enveloped by the ringed end of the iron rod, E, which passes through the top of the torpedo, and some distance above it; and has horizontal rods, G, called feelers, attached rigidly to its upper extremity. When a ship impinges on the feelers, the rod is deflected from the perpendicular; the ring at its lower end breaks the glass tube; the acid acting on the lime, generates great heat, and explodes the powder.

In the electric torpedo a wire insulated in a small cable is laid from a battery on shore to the submarine mine. It enters it by an insulated joint, and is then soldered to a small piece of platinum wire placed in the middle of the priming of the torpedo; from the other end of the platinum a second wire communicates

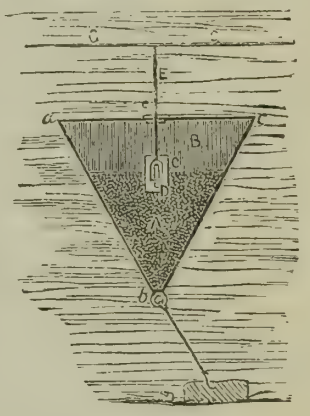


Fig. 1.

with the metal sides of the torpedo case. On closing circuit at the battery, the current passes by the cable into the torpedo, heating the platinum to incandescence, and exploding the mine. There is thus no need of a second cable; the water and the earth take its place. Submarine mines are usually charged with gun-cotton, which has the great advantage of being explosive by means of a fulminating fuse, even when wet through leakage of the torpedo case.

Submarine mines are usually moored or laid on the bottom in several lines, the mines of the second line being opposite the intervals of the first, so that it is difficult for a hostile ship to pass up a defended channel without coming within reach of one or more of them. As a ship approaches, her course is carefully watched so as to fire a mine at the right moment. In order to explain how this is done, let us take the case of the channel AB.

Two or more lines of mines are laid down across its mouth. For the sake of clearness we show only a few of those of the first line in the diagram. At C and D two stations are selected, commanding a view of the defended waters. At C is the voltaic battery, and the wires from the mines connect them with D, while a

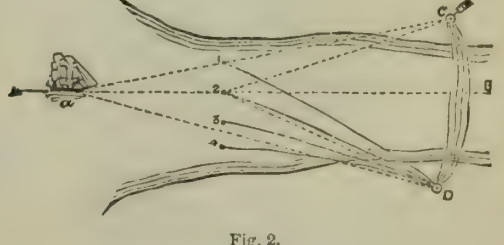

Fig. 2.

second series of wires, each corresponding with one of the first series, connects D and C. There are thus two breaks in the circuit of every mine, one at C, where a number of 'firing-keys' are arranged so as to place at will the battery in connection with any of the wires; the second break is at D, where similar firing-keys connect at will each wire of one series with the corresponding wire of the other. A ship is seen approaching on the course AB. When she is at *a*, the observer at C notices that her bearing is the same as that of mine No. 1. He therefore closes the break in the first circuit by means of the firing-key, but no current passes, for the observer at D sees her well to the left of the bearing of mine

No. 1, and therefore leaves his break open. Not until she is actually over No. 2 will both observers at the same moment see that her bearing corresponds to that of No. 2, and closing both breaks in the circuit, fire the mine. By means of a telescope combined with the firing-key, these bearings can be taken with great accuracy. In some cases the ship herself is made to close the circuit in striking a rather complicated apparatus called a circuit-closer, which floats above each of the mines arranged on this system.

Of locomotive torpedoes there are three classes: (1.) The Whitehead fish torpedo, which has a fish-shaped case, and is propelled in a straight line under water by means of a small screw-propeller driven by compressed air. It is discharged from a carriage on the deck of a man-of-war, and explodes on impact against the object aimed at. The secret of the construction has been sold by the inventor to the Austrian, Russian, and English navies. (2.) The Harvey 'towing torpedo,' which is towed out at an angle from the side of the attacking ship, and manœuvred so as to come in contact with the bottom of the ship attacked. It is exploded either mechanically on contact, or by means of an electric fuse, the wire being inserted in the towing line. (3.) Boom or outrigger torpedoes, which are carried on long booms in the bows of boats or steam-launches, and thus driven against the side of a hostile ship and exploded. Torpedo boats are becoming a special feature of European navies; they are swift steamers not more than 60 feet long, lying low in the water, and steaming up to 19 knots an hour. The *Polyphemus*, added to the English navy in 1881, is an armored ram, expressly and cunningly designed for torpedo warfare (carrying Whitehead torpedoes), and is a formidable vessel, 240 feet long. See *Fraser's Magazine*, 1872; illustrated articles in the *Popular Science Review*, 1873 and 1875; the illustrations in the *Illustrated London News*, June 16, 1877; and Sleeman's *Torpedoes and Torpedo Warfare* (1880).

TO'RQUAY, a watering-place on the south coast of Devon, occupying a cove on the north side of Tor Bay, 23 miles from Exeter, and about 210 from London. The name is derived from the Celtic 'Tor' (q. v.), a hill, which occurs in the appellations of the neighboring peaks of Dartmoor (Hey Tor, Rippon Tor, &c.), and thence is given to the bay, and to the ancient parish of Tormohun or Tormoham, in which T. is situate. The monastery of Tor Abbey was founded in the 12th c.; but the town of T. is of recent origin. The bay is noted in history as the place where William of Orange landed in 1688, and was often used as a naval rendezvous during the war with France; but till the beginning of the present century, T. was little more than an assemblage of fishermen's huts. About that time, the advantages of its climate —which are a peculiarly sheltered position, an equable temperature, and freedom from fogs—caused it to be resorted to by consumptive patients; and it soon attained a European celebrity, which is still almost unrivaled. The romantic hills and valleys of Tormohun and its environs are being rapidly overspread with villas, gardens, terraces, and rows of smaller dwellings. The original parish has been divided into four, and possesses six (English) churches, one Roman Catholic, one Scotch Presbyterian, and numerous dissenting chapels. A stone pier was built in 1803, and the port is resorted to by colliers and small traders. The geological formation consists mainly of a range of transition limestone cliffs in strata much contorted, containing beautifully-tinted marbles. There are also Old Red Sandstone and argillaceous shale. The scenery is of the most varied and picturesque description. Besides the mildness of the winter, the vicinity of the sea in front, and of Dartmoor in the rear, greatly moderates the summer climate, so that while the mean winter temperature is 44°, that of the summer is only 55°. The population has increased from under 1000 in 1801 to 32,946 in 1881. Kent's Cavern, discovered in 1824, and the Brixham Cave, discovered in 1858, are rich in fossils, and are among the earliest places in the kingdom in which prehistoric human remains have been found.

TORQUEMADA, THOMAS DE, the first inquisitor-general of Spain, was born at Torquemada in 1420, and died 16th September 1498. He became prior of a Dominican monastery at Segovia, and in 1483 was by Ferdinand and Isabella, and by the pope, made inquisitor-general for Spain. He thoroughly organized the system, established numerous tribunals, and promulgated a code of laws. See INQUISITION.

TORQUES (Celtic, *torc;* Lat. *torqueo*, I twist), a species of gold ornament, meant to be worn round the neck, which was much in use in ancient times, both among Asiatic and North European nations. It consisted of a spirally-twisted bar of gold, bent round nearly into a circle, with the ends free, and terminating in hooks, or sometimes in serpents. These ornaments seem to have formed an important part of the wealth of those who wore them, and of the plunder obtained by the Roman conquerors from a Celtic or oriental army. A monument erected to a Roman soldier not unfrequently specified the number of torques that had been conferred on him. Numerous examples of the torques have been dug up in Great Britain and Ireland, as well as in France, and are to be found in archæological collections. Both in Europe and in Asia, the torques resembled one form of Bracelet (q. v.) on a larger scale.

TO'RRÉ DEL GRE'CO, a city of Southern Italy, at the base of Vesuvius, 7 miles from Naples. Its pop., though often reduced after the eruptions, was 18,950 in 1871. The town is always new, being from time to time destroyed by the lava, and always raised again from its ruins, by the attachment of its inhabitants to their native soil. The soil is fertile, producing fruit and wines similar to those of Greece. Its inhabitants are engaged in the tunny, oyster, and sardine fisheries. Mention is made of the town under its present name (the origin of which is unknown) as early as 1324 A.D. It suffered much in the eruption of 1631, and in that of 1794 it was almost totally destroyed by the lava. The earthquke of 1856, and the eruption 1861, when the town was overwhelmed by vast showers of ashes, were equally destructive. But T. del G. has always risen again from its ruins.

TO'RRÉ DELL' ANNUNZIA'TA, a thriving town of Southern Italy, stands on the south base of Mount Vesuvius, 13 m. S.E. of Naples. A fishery and a coasting-trade are carried on. Pop. (1881) 20,060.

TO'RRENS, LAKE, sometimes a brackish lake, at others, merely a salt-marsh, in S. Australia; lat 30° 11′ to 32° S.; and long. 137° 30′ E. It lies 30 m. N. of Spencer Gulf. Length, 130 m.; breadth, 18 to 20 m.

TO'RRES STRAIT lies between North Australia and Papua or New Guinea, in lat. 9° 20′—10° 40′ N.; and long. 142° 30′ E. The channel is about 80 miles in width; and its navigation, though practicable, is rendered dangerous and difficult by the innumerable shoals, reefs, and islands with which it is strewn. It was discovered by Torres in 1606.

TO'RRES-VE'DRAS, a town of Estremadura, kingdom of Portugal, on the left bank of the Sizandro, about 30 miles north of Lisbon. It has a pop. of about 3300, and carries on some trade in wine; but derives its reputation solely from having given name to those famous lines of defence within which Wellington took refuge in 1810, when he found it impossible to defend the frontier of Portugal against the French armies; and from which, in the year following, he issued on that career of slow and hard-won victory, which ended in the expulsion of the French from the Peninsula. The *first*, or outermost of these lines, extending from Alhandra, on the Tagus, to the mouth of the Sizandro, on the sea-coast, and following the windings of the hills, was 29 miles long; the *second* (and by far the most formidable) lay from 6 to 10 miles behind the first, stretching from Quintella, on the Tagus, to the mouth of the St. Lorenza, a distance of 24 miles; the *third*, situated to the south-west of Lisbon, at the very mouth of the Tagus, was very short, being intended to cover a forced embarkation, if that had become necessary. The entire ground thus fortified was equal to 500 sq. miles.

TORRICELLI, EVANGELISTA, a celebrated Italian mathematician and philosopher, was born at Piancaldoli in the Romagna, Italy, October 15, 1608. He was brought up by an uncle who resided at Faenza, and who put him under the tuition of the Jesuits. When 20 years old, he was sent to Rome, and there devoted himself to mathematical studies. Galileo's theories on force and motion, which had been published a short time before, especially engaged his attention, and led to his publishing a *Trattato del Moto* (1643), a meritorious work, but containing few new discoveries of consequence. The publication of this work led to his being invited by Galileo to visit him; and on the old philosopher's death, three months afterwards, he was appointed to succeed Galileo in the chair of Philosophy and Mathematics at Florence. Here he resided till his death in 1647. The discovery which will preserve T.'s name through all ages was the interpretation of the previously known fact, that water will rise in a suction-pump only to the height of about 32 feet. The fact that water *could* be raised in a pump was expressed by the empirical law, that 'nature abhors a vacuum, and after the limit of 32 feet was ascertained, the law was modified accordingly by Galileo. T., wishing to perform this experiment more conveniently, employed mercury, and found that nature's abhorrence of a vacuum varied for different fluids, and was represented by a column of fluid in height inversely proportional to its specific gravity; here, then, was an additional fact of importance, containing the clue to the mystery, and T. was not long in hitting on the idea that the column of fluid was sustained by the pressure of the atmosphere on the open surface of fluid. See BAROMETER. T. also effected the quadrature of the cycloid, but in this was anticipated by Roberval.

TO'RRINGTON, a municipal borough and market-town of the county of Devon, on an eminence sloping to the Torridge, 10 miles south-south-west of Barnstaple. The inhabitants, who slightly decreased in numbers between the years 1851 and 1861, are employed for the most part in agriculture and glove-making;

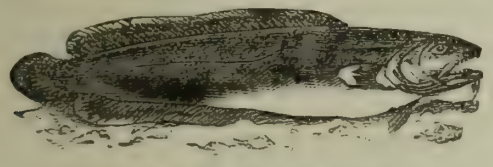
but the industry is inconsiderable. Pop. (1881) 3445. The name of T. emerges frequently during the great Civil War; and the capture of the town by Fairfax in 1646, on which occasion the church, with 200 prisoners, and those who guarded them, were blown into the air by gunpowder, proved fatal to the king's cause in the west.

TORSHO'K, one of the most acient towns in Russia, in the government of Tver, stands on the Tverza, in an undulating district, 309 miles south-east of St. Petersburg. Leather and malt are the most important branches of manufacture; but the gold and silk embroideries of this town are well known throughout the empire, and obtained much celebrity at the London Exhibitions of 1851 and 1862. There is an extensive trade in corn, which the merchants of T. purchase in the neighboring districts and at the landing-places of the Lower Volga, and thence transport to St. Petersburg by water. Much of this corn is ground at T., and the flour exported. The town was founded in the 11th century. Pop. (1880) 12,900.

TO'RSION is a method of common application in surgery for the purpose of checking arterial hæmorrhage in certain cases. The wounded vessel is drawn out and fixed by a pair of forceps a quarter of an inch from the end; the end of the artery is then twisted round till it will not untwist itself. It is especially useful when there are many small arteries wounded in an operation, as, for example, in the extirpation of a large tumor.

TORSION-BALANCE (Lat. *torsio*, twisting) is an instrument first invented by Coulomb, in which the force exerted by a twisted thread or filament to recover its original position, is made the means of measuring small degrees of electrical and magnetical attraction. See ELECTRICITY, fig. 9. It has also been used in determining the mass and density of the earth. See EARTH.

TORSK, or, by corruption, TUSK (*Brosimus vulgaris*) a valuable fish of the family *Gadidæ* (q. v.), abundant in the northern parts of the Atlantic Ocean. The genus is characterized by a single long dorsal fin, and by having the vertical fins separate. The T. is from 18 inches to 2 feet, rarely 3 feet long; the head small, the body moderately elongated, one barbule under the chin, the dorsal and anal fins distinct from the tail, although separated from it by a very short interval; the tail rounded; the head dusky; the back and sides yellow, passing into white on the belly. It lives in deep



Torsk, or Tusk (*Brosimus vulgaris*),

water, approaching the land in shoals only at the spawning-time, which is very early in the year. It spawns among the sea-weed of the coast. It is caught in the same manner as cod, ling, &c.; and although rather firm and tough when fresh, is generally esteemed, when dried and salted, to be the best of stockfish. It is occasionally caught in the Firth of Forth, but belongs to more northern regions, and is very abundant in the Shetland Isles, the Faroes, on some parts of the coast of Norway, and on the south and west coasts of Iceland.

TO'RSO (Ital.), strictly, signifies a trunk, e. g., the trunk of a tree, but is specially applied to an ancient statue of which only the body remains. Of such imperfect relics of classic art, the most famous is the *Torso of Hercules*, a masterpiece of manly beauty, discovered in the Campo del Fiore at the beginning of the 16th c., and placed, by order of Pope Julius II., in the Vatican.

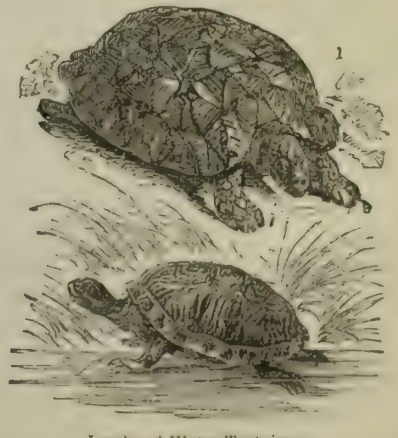
TORSTENSOHN, LEONARD, Count of Ortala, the most active, enterprising, and successful of the Swedish generals, who were engaged in the Thirty Years' War (q. v.), was born at Torstena, 17th August 1763, became one of the royal pages in 1618, and attended Gustavus Adolphus in most of his earlier campaigns. When Gustavus entered Germany in 1630, T. was captain of the body-guard; and the brilliant services he rendered at Preitenfeld, the Lech, and on other occasions, were rewarded with rapid promotion. Taken prisoner at the combat of Nuremberg (24th August 1632), he was subjected to rigorous treatment, which so ruined his health, that on his exchange six months after, he returned to his post in the Swedish army a confirmed invalid; yet a vigorous mind and energetic character so overmastered bodily infirmity, that though reduced to the necessity of being always conveyed in a litter, he proved himself a most able officer under Bernhard of Weimar and Baner, the successors of Gustavus. In 1641, on the death of his former chief, the able and chivalrous Baner, he was appointed to the command in chief of the Swedes in Germany. His military career was marked by a brilliancy of conception, fertility of resource, resolute daring, and above all, by an extraordinary rapidity of execution, which broadly distinguished it from those of his contemporaries, and set at naught all the precautionary and defensive measures of his opponents. Having recruited and equipped his army, he invaded Silesia, routed the Austrians at Glogau and Schweidnitz, reduced most of Moravia, and being pressed back into Saxony by the Archduke Leopold and Piccolomini, gallantly turned upon the multitude of his pursuers (2d November 1642), and on the field of Breitenfeld, where Tilly's reputation for invincibility was cast down in the dust by Gustavus, inflicted a bloody defeat on the same adversaries; he then resumed the execution of his plans of invasion, and laid Moravia and Austria under contribution. Ferdinand III., despairing of protecting his territories from T., negotiated with Christian IV. of Denmark to make a diversion by invading Sweden; but T., with characteristic promptitude, left Moravia in September 1643, traversed Saxony and the Upper Palatinate, burst into Holstein, and in less than six weeks subjugated the Danish mainland.

The Austrians under Gallas followed in pursuit of him, to aid their allies, but arrived too late; and in attempting to coop him up in Holstein, were routed, and driven into Saxony; and again totally defeated (23d November 1644) at Jüterbogk, in attempting to bar his return into Bohemia. Gallas was now deposed; but a combination of talented generals, as Montecuculi, Goertz, and others, was found to be equally ineffective against the resistless Swede, who, by a great victory at Yankovitz (14th February 1645), secured the navigation of the Danube, and the possession of the hereditary countries north of it. The emperor, empress, and principal nobility now deserted the capital; the Saxons again joined the Swedes, and the Danes, routed at sea as well as on land, besought peace, which was granted (13th August 1645). At this time, when a few more of T.'s weighty blows would have completely unseated the Hapsburg family, his gradually increasing ailments compelled him to resign the command to one very much his inferior, and retire to Sweden, where he experienced a most distinguished reception from Queen Christina, was created a count, and appointed to various high offices successively. He died at Stockholm, 7th April 1651.

TORT (Lat. *tortus*), in the law of England, includes all those wrongs for which a remedy by compensation or damages is given in a court of law, and which wrongs arise irrespective of any contract. Such are assaults, imprisonments, taking one's goods without title, injury to one's body or character. The general rule of law was, that the right of action for a tort died with the person who committed it; but this defect has been cured by statute to a certain extent. If the wrong was done within six months preceding the wrongdoer's death, an action may be brought against his executors within six months after they have assumed office. So if the injured party lived, he could always bring an action of damages; but if he died, his executors or relatives could not do so, until Lord Campbell's Act enabled the wife, husband, parent, or child of such deceased injured party to sue for damages; and in such case the jury may apportion the damages between the widow and children who sue. The right to bring an action for a tort is limited to two, four, or six years respectively, according to the nature of the wrong.—In Scotland, there is no time limited for bringing the action.

TORTEAU. See ROUNDLE.

TO'RTOISE (*Testudo*), a genus of Chelonian reptiles, which once included the whole order, but is now much restricted. The popular name T. is never given to the marine Chelonians, which



Land and Water Tortoises:
1, Common Land Tortoise (*Testudo Græca*); Lettered Tortoise (*Emys scripta*).

are called Turtles (q. v.), and although it is sometimes given—generally with a prefix, as Marsh T., River T., Fresh-water T.—to the kinds which inhabit fresh water (see EMYS and TERRAPIN)

yet when used by itself, it is commonly the designation of what are distinctively called Land Tortoises, which belong to the genus *Testudo* as now restricted, and the genera most nearly allied to it. In *Testudo*, the carapace is of a single piece, bulged, and soldered by the greater portion of its lateral edges to the *plastron* (see CHELONIA); the legs are very short; the toes are very short, and united to the nails, which are thick and conical, five on the fore-feet and four on the hind-feet. The species are numerous and widely distributed, inhabitants of the warmer temperate and of tropical countries. They all feed on vegetable food. None of them are found in Britain, but several in the countries around the Mediterranean. The most common of these is the GREEK T. (*T. Græca*), which attains a length of 12 inches, and has a broad and equally bulged carapace; the scales of which are granulated in the center, striated on the margins, and spotted or marbled with black and yellow. This is the species of an individual of which a most interesting account is given by White in his *Natural History of Selborne*. It lives to a very great age, 100 years or more, as probably do all the other species, and spends the winter in a dormant state, as do all those which are not inhabitants of tropical climates; selecting for itself a place of hybernation when cold weather begins to come on, or preparing it by scooping a hole in the earth. During the heat of summer, it feeds voraciously; but in colder weather, both before and after its hybernation, it eats little.

The love-season, which is in the beginning of summer, is one of great activity, and tortoises express their amorous desires by striking their shells against those of their mates. The Greek T. is used for food in some parts of the south of Europe. The flesh of all species of T. appears to be good for food, and the eggs of all are regarded as delicacies. A very large species is the Indian T. (*T. Indica*), if several species are not confounded under that name. It has been found on the coast of Coromandel, four feet and a half in length, its bulge being about fourteen inches. It is particularly abundant in the Galapago Islands, and has even been supposed by Darwin to be originally a native of them, and to have been diffused from them by the bucaneers over other tropical regions. It is known that the bucaneers often carried away tortoises alive from the Galapagos, but this fact does not seem probably to account for the abundance of the species in other places. The Galapago T. is often 200 lbs. in weight. Its flesh is of excellent quality, as are also its eggs. It forms tracks from the arid districts near the shore to the high districts of the islands, where there are springs for the purpose of drinking; and these tracks, which are broad and well beaten, are traversed apparently at irregular intervals, the animal swallowing a very large quantity of water at a time, so that its bladder is greatly distended, and the water contained in the bladder is at first almost pure, and is gradually absorbed. The numbers of tortoises in some tropical and subtropical countries are very great. Professor E. Forbes speaks with admiration of the numbers of *T. Græca* and *T. marginata* straying about the plains of Lycia, and browsing on the fresh herbage in spring. Darwin describes the tortoises of the Galapagos as very numerous; and Leguat, in his account of the French Protestant expedition to the island of Rodriguez, in the beginning of last century, declares that the tortoises often came out together in such numbers to feed, that a man might have walked for a considerable distance on their backs as on a pavement.

Tortoises exhibit very little intelligence; they are, however, capable of recognizing the hand that feeds them.

TORTOISE-SHELL, the large scales of the carapace, or shield, of a species of sea-turtle, the *Chelonia imbricata* and *Testudo imbricata* of several authors—*Caretta imbricata* of Dr. Gray. It is found in the Indian Ocean, Amboyna, New Guinea, Seychelles, Havanna, and the Red Sea. Tortoise-shell is so called because formerly the order of animals to which it belongs was little known, and all were confounded under the general name of Tortoises. A remarkable peculiarity in this species is the arrangement of the thirteen plates forming the carapace, which, instead of being joined together by their edges, so as to make apparently one piece, are thinned off at their edges, and overlap each other like the tiles of a roof. They vary in size according to the part of the shield they occupy. The larger are sometimes from a foot to 18 inches long, by 6 inches broad; the thickness rarely exceeds the eighth of an inch. The beautiful mottled color and semi-transparent characters of this material are well known. A remarkable quality is possessed by tortoise-shell, which very greatly increases its usefulness for the ornamental purposes to which it is generally applied—that is, its property of being easily softened by a heat equal to boiling water, and of retaining any form when cold which has been given to it when heated. Pieces can also be welded together by the pressure of hot irons properly applied. In Britain, the chief use of tortoise-shell is making combs for the hair; but it is also used for inlaying small pieces of ornamental furniture and various other fancy objects. In India, China, and Japan, its use is well understood, and some very beautiful articles are made of it, exhibiting great skill and taste. Great Britain alone consumes about 15½ tons, of the value of about £24,000.

TORTO'LA. See VIRGIN ISLANDS.

TORTO'NA (anc. *Antilia*, or *Dertona*), a town of Northern Italy, in the province of Alessandria, and situated on the right bank of the Scrivia (a small river which flows north to join the Po), and 13 miles east of Alessandria, with which it is connected by railway. Pop. (1871) 8620. The principal buildings are the *Duomo* and church of San Francisco. T. has manufactures of silk, leather, hats, &c. It was a notable place in the middle ages—the old walls, and the ruins of a castle in which Frederick Barbarossa lived, being a relic of those turbulent times.

TORTO'SA (anc. *Dertosa*), an old and fortified town of Spain, province of Tarragona, picturesquely situated on a sloping eminence overlooking the Ebro, from the mouth of which it is distant about 22 miles. The streets are narrow, and the place has altogether a dull look. Some inconsiderable manufactures are carried on, and the sturgeon and lamprey fisheries afford employment to considerable numbers. Pop. upwards of 20,000.

TORTU'GAS (Sp. Turtles), a group of ten islets or keys, also called the Dry Tortugas, belonging to the United States, at the entrance of the Gulf of Mexico, 120 miles west-south-west of Cape Sable, the southern point of Florida. They are low coral islets partly covered with mangrove bushes. There is a lighthouse on Bush Key; and on the same island stands Fort Jefferson, garrisoned by about 100 men. During the civil war, the fort was used as a penal station for Confederate prisoners.

TORTURE. Examination by torture, otherwise called 'The Question,' has been largely used in many countries as a judicial instrument for extracting evidence from unwilling witnesses, or confessions from accused persons. In ancient Athens, slaves were always examined by torture, and their evidence seems on this account to have been deemed more valuable than that of freemen. Any one might offer his own slave, or demand that of his opponent, to be examined by torture; and it was supposed to constitute a strong presumption against any one that he refused to give up his slave for that purpose. No free Athenian could be examined by torture, but torture seems occasionally to have been used in executing criminals. Under the Roman republic, only slaves could be tortured, and as a general rule, they could not be tortured to establish their masters' guilt. Under the Empire, torture, besides being much used in examining slaves, was occasionally inflicted even on freemen, to extract evidence of the crime of *læsa majestas*. Cicero and other enlightened Romans wholly condemned its use. Until the 13th c., torture seems to have been unknown to the canon law; about that period, the Roman treason-law began to be adapted to heresy as *crimen læsæ majestatis Divinæ*. A decree of Pope Innocent IV., in 1282, calling on civil magistrates to put persons accused of heresy to the torture, to elicit confessions against themselves and others, was probably the earliest instance of ecclesiastical sanction being adhibited to this mode of examination. At a later period, however, torture came to be largely employed by the inquisitors.

From the civil law, torture became a part of the legal system of most European countries. It was adopted early, and to a large extent, by the Italian municipalities. In Germany, elaborate apparatus for its infliction existed, not merely in the dungeons of the feudal castles, but in the vaults beneath the town-halls of Nürnberg and Ratisbon, where the various implements used are yet to be seen. It continued to be practiced in the prisons of Germany when they were visited by Howard in 1770. In France, it was part of the judicial system till 1789, and in Scotland it was still in frequent use after the Restoration, and was only abolished by 7 Anne, c. 21, s. 5.

The use of torture seems always to have been repugnant to the genius of the law of England: though occasionally used by an exercise of prerogative, it may be doubted whether it was ever recognized as lawful in the ordinary course of the administration of justice. The first instance we have of its use is in 1310, in aid of the ecclesiastical law, during the struggle between Pope Clement V. and the Templars. Edward II., when applied to to sanction the infliction of torture by the inquisitors in the case of certain Templars accused of heresy and apostasy, at first refused; but on a remonstrance by Clement, he referred the matter to the Council; and on the recommendation of the Council, the inquisitors were authorized to put the accused to the torture, but without mutilation or serious injury to the person, or effusion of blood. During the Tudor period, the Council assumed the power of directing torture-warrants to the lieutenant of the Tower, and other officers, against state prisoners, and occasionally also against persons accused of other serious crimes; and similar warrants were at times issued under the sign-manual. Under James I. and Charles I., torture was less resorted to, and only in state trials. In 1628, in the case of Felton, the assassin of the Duke of Buckingham, the judges declared the examination of the accused by

torture, for the purpose of discovering his accomplices, to be illegal. Torture was inflicted for the last time in England in May 1640. It is now disused in all countries of Europe, and is universally acknowledged to have been a most unsatisfactory mode of getting at the truth; often leading the innocent, from weakness of body, to plead guilty to crimes which he had not committed.

The instruments of judicial torture have been various. The most celebrated is the Rack, an oblong horizontal frame, on which the accused was stretched, while cords, attached to his legs and arms, were gradually strained by a lever or windlass, an operation which, when carried to extreme severity, dislocated the joints of the wrists and ankles. It is as old as the 2d c. in the south of Europe, but is said to have been unknown in England till introduced into the Tower by the Duke of Exeter, Constable of the Tower, whence it acquired the name of the 'Duke of Exeter's Daughter.' In Germany, the rack was sometimes furnished with a roller, armed with spikes, rounded off, over which the sufferer was drawn backwards and forwards. A vertical rack was also in use in that country. The person subjected to it was raised to the roof by a rope attached to his arms, which were bound behind his back; and two heavy stones having been attached to his feet, the rope was loosened so as to let him fall with a jerk to within a few inches of the ground. Among the lesser tortures may be mentioned the Thumbikins, Boots, Pincers, and Manacles; and in England, an instrument called the Scavenger's (properly Skeffington's) Daughter, the invention of Sir W. Skeffington, lieutenant at the Tower in the reign of Henry VIII.

TO'RULA CEREVI'SIÆ, or the YEAST-PLANT, is one of those fungi which are connected with the process of fermentation. The general history of this fungus will be noticed in the article YEAST, and we shall here only refer to the medicinal bearing of this subject. This plant, which is also known under the names of *Saccharomyces, Mycoderma cerevisiæ*, and *Cryptococcus fermentum*, may be readily observed by examining a little yeast under the microscope, when it will be seen in the form of round or oval corpuscles (cells), varying in diameter from the 800th to the 400th of a line, and many having smaller corpuscles in their interior. They grow by protusion of gemmules, and germinate sometimes on one, and sometimes on several spots of the primitive fungus cells. These shoots throwing off new gemmules, the yeast-plant gradually forms single or branching rows of oblong cells, connected together like beads. This peculiar arrangement of the cells, and the fact that they are not acted on by acetic acid, is characteristic of the plant.

The Yeast-plant, taken from a fluid ejected in large quantities from the stomach of a man suffering from stricture of the pylorus. Magnified 200 diameters.

In those cells marked ×, a young cell is seen growing in the interior; while in the large cell marked × ×, there is a simultaneous internal production and external gemmation of cells.

This fungus exists in the saccharine urine of *diabetis mellitus*, after it has been discharged for 24 hours or longer, and its appearance in urine within a day or two is sufficient to lead to the suspicion of the presence of sugar. It likewise is of not unfrequent occurrence in vomited matters and in fæcal evacuations; and wherever it is found, it is indicative that the fluid is in a state of saccharine fermentation.

As fungi more or less closely resembling the yeast-plant often occur in non-saccharine urine that has stood for some days, the assumed presence of the T. C. must not be taken as a proof of the presence of sugar, although it affords a strong hint for testing for that substance.

TO'RUS, the convex member of the base of classic columns. See COLUMN.

TOSHACH (Celtic, captain, the name which was given among Celtic nations to the military leader of a clan or tribe, whose functions were in early times always separated from those of the supreme judicial officer. When the office of toshach, originally elective, became hereditary, according to the principle of divided authority characteristic of Celtic communities, it remained permanently in the eldest cadet of the clan. See TANISTRY.

TO'TEM. The ruder races of men are found divided into tribes, each of which is usually named after some animal, vegetable, or thing which is an object of veneration or worship to the tribe. This animal, vegetable, or thing is the *totem* or *god* of the tribe. From the tribe being commonly named after its totem, the word is also frequently employed to signify merely the tribal name. Numerous tribes with totems exist in America, in Australia, the South Pacific Islands, and in Central Asia; and there are some reasons for thinking that such tribes were once numerous even in Europe among races belonging to what is called the Indo-European division of the human family.

Among the Red Indians of America, the following are totems of tribes existing or known to have existed: the Wolf, Bear, Beaver, Turtle, Deer, Snipe, Heron, Hawk, Crane, Duck, Loon, Turkey, Musk-rat, Sable, Pike, Cat-fish, Sturgeon, Carp, Buffalo, Elk, Reindeer, Eagle, Hare, Rabbit, and Snake; the Reed-grass, Sand, Water, Rock, and Tobacco-plant. Among the tribes of native Australians, the totems are similarly, for the most part, selected from the fauna of the country. The totems of the Kirghiz tribes of Central Asia are all of them animals to which (in explanation of their reverence for them) the tribes trace back their descent.

It has been suggested that the explanation of the crests and emblems of the now disrupted tribes and clans of our own country, and of Europe generally, is to be found in the supposition, that the creature or thing on the crest was originally the totem of the clan or tribe. On this supposition, the widespread clan Chattan or Cattan, for instance, which is represented in the Scotch Highlands, and can be traced in France, Germany, and Egypt, would fall to be recognized as the *Cat* tribe, the cat having once been its *totem*, as it is still its crest or emblem. It has also been thrown out, that many of the mythical traditions of ancient Greece admit of a reasonable meaning, if we suppose that there were anciently in Greece tribes with *totems*—bull, boar, and lion tribes; snake, ant, and dragon tribes. These suggestions have not yet been put to the test of a thorough investigation; but so far as inquiry has gone, the results are in favor of the conclusions to which they point as to the early condition of human tribes all over the world. A single instance may be given of success in tracing back a totem to old times and in widely separated countries. There are numerous existing Snake tribes both in America and the South Sea Islands, and there is something like *proof* that the snake was the totem of very many and powerful ancient races. Its worship can be traced among Semitic races; there are traces of it in the traditions of the Pelasgi; there are proofs of it among the Celts; and the most magnificent ecclesiastical architecture in the world is that of the Nagas—the serpent-worshipers of Cambodia—still existing, and only recently brought to light. We may believe that, in the period of primitive animal-worship, when the serpent was a creature of so much importance, other animals also had their worshipers, and that snake-tribes were not the only tribes with animal totems in those times, any more than they are among existing primitive peoples. See *Cambrian Journal*. vol. iii., 2d series, p. 149; *Grey's Journals*, vol. ii. chap. xi.; Mitchell's *Russians in Central Asia;* Latham's *Descriptive Ethnology;* Sydenham's *Baal Durstrigensis;* and foot-note to *Kinship in Ancient Greece*, by J. F. M'Lennan; *The Origin of Primitive Superstitions*, by R. M. Dorman (Philadelphia, 1881).

TOTIPA'LMÆ, Cuvier's name for a group of birds of the order *Palmipedes*, having the hind-toe connected with the other toes by a web. Pelicans, cormorants, frigate-birds, gannets, and darters belong to this group. All the T. are marine; they feed on fishes, molluscs, and other marine animals, and are excellent swimmers and divers. Many of them have long wings, and are birds of powerful flight.

TOTNES, or TOTNESS, a municipal borough and market-town of Devonshire, pleasantly situated on the slope of a steep hill, on the right bank of the river Dart, about 10 miles from its mouth. It is a place of great antiquity, has an interesting church of the 15th c., and some curious antique houses; the ruined keep of the ancient castle, on the summit of the hill, is said to have been built by Joel de Totneis, a Norman baron, on whom the manor was bestowed at the Conquest, and who founded here also a Cluniac priory. The river Dart is navigable for vessels of 200 tons up to the town, which is a place of some little shipping trade. The borough formerly returned two members to parliament, but was disfranchised for corrupt practices at elections by the Reform Bill of 1867. Steamers ply during the summer months between T. and Dartmouth. It is a station on the South Devon Railway. Pop. (1871) 4073; (1881) 4089.

TOU'CAN (*Ramphastos*), a Linnæan genus of birds, now forming the family *Ramphastidæ*, which belongs to the order *Scansores*, and contains nearly forty known species, all natives of tropical America, and remarkable for the magnitude of the bill. They are divided into two groups, the true Toucans (*Ramphastos*), and the Aracaris (q. v.) (*Pteroglossus*), of which the latter contains the greater number of species: the former has the largest bill, and the tail is shorter. There is a difference also in the prevalent colors, the aracaris generally exhibiting much green and yellow, whilst the true toucans have the ground color of the plumage usually black; the throat, breast, and rump often gaily adorned with white, yellow, and red. The colors, however, are not in general finely blended, but appear in strong contrast. The legs of toucans are short; the feet have two toes before and two behind. The form of the body is short and thick; the tail is rounded or even, varying in length in the different species from half the length to almost the whole length of the body, and is capable of being turned up over the body in a remarkable manner, which it

always is when the bird is at roost. The neck is short and thick; the enormous bill is at the base of the full width and depth of the head, and is in some species more than half the length of the body. It is arched towards the tip, irregularly toothed along the margins of the mandibles, and extremely cellular and light, yet strong in structure. The tongue is very long, narrow, and singularly feathered on each side, the processes which give it this feathered appearance probably adding much to its sensibility as an organ of taste. When a T. takes food between the points of the mandibles, the tongue is immediately applied to it, as if to test or enjoy it, and afterwards it is tossed into the throat by a sudden throwing back of the head.

Toucans may almost be described as omnivorous; they eat fruits with avidity, but they also seize and devour small birds. Their powerful bill enables them to kill a small bird by a single squeeze. They make a curious clattering noise with their great mandibles, and also emit at times a harsh cry. They live chiefly in the depths of the South American forests, in small flocks. They are easily tamed, and bear cold climates well. In captivity, they readily eat rice, bread, potatoes, eggs, and many other kinds of food. They are remarkable amongst birds for regurgitation of food, in order to a kind of mastication in the great bill, analogous to rumination in quadrupeds. The colors of the bill are, in most of the species, very brilliant during life, but disappear from stuffed specimens in museums. The largest species, as *Ramphastos Toco*, are about two feet in length. The *R. Tucanus* is the yellow-breasted T.; the *R. Ariel* is the commonest species.

TOUCH is the sense through which we take cognizance of the palpable properties of bodies. It is used in two senses. In its extended acceptation it implies, says Dr. Carpenter, 'our consciousness of *all* those sensory impressions which are neither olfactive, visual, auditory, nor gustative; and it is therefore designated as the *general sense*, in contradistinction to those which are considered as *special senses*. In its limited application, on the other hand, it is used to designate that modification of the general sensibility which is restricted to the tegumentary surface, or to some special portion of it, and which serves to excite definite ideas in our minds respecting the form, size, number, configuration, weight, temperature, hardness, softness, &c. of objects brought within its cognizance.'—Article 'Touch,' in *Cyclopædia of Anatomy and Physiology*, vol. iv. p. 1163. In the article SENSIBILITY, we have briefly noticed touch in its general sense; and we shall here confine ourselves to the investigation of the sense of touch in its limited application, as exercised by the organs specially adapted for the reception of tactile impressions.

The special organs of touch are the papillæ, which are figured and very briefly noticed in the article SKIN. These papillæ are more elevated and numerous on the palmar surface of the ends of the fingers than on any other part of the skin (although they are still larger on the tongue). They have an average length in man of $\frac{1}{100}$th of an inch. Their surface, after the removal of the epidermis, appears, from the investigations of Todd and Bowman, to be composed of the basement membrane of the cutis itself; and their interior is composed of fibrous tissue, vessels, and nerves, as is seen in the figures of the lingual papillæ given in the article TASTE, SENSE OF. In each papilla is a small arterial twig, which, entering at the base, subdivides into capillary vessels, which form loops, whose convexity lies in the papillary summit. The vascularity of the papillæ is so great, that their presence and relative size may be determined simply by the depth of the color imparted to the skin by a good injection of its vessels. Hence, as a general rule, the vascularity of the integument is proportioned to its perfection as an organ of touch. With regard to the mode in which the nerves terminate, there is still considerable doubt. According to Todd and Bowman, it is often impossible to detect any nerves at all within the papillæ, when such were plainly visible at their base; and they incline to the belief, that the nervous tubules either entirely, or in a great measure, lose the white substance when within the papillæ.

In the lower animals, as in man, the papillæ are especially developed in those parts of the outer surface which are especially endowed with tactile sensibility. For the following illustrations of this statement, drawn from comparative anatomy, we are indebted to Dr. Carpenter: 'In the quadrumana generally, both the hands and feet are thickly set with papillæ; and in those which have a prehensile tail, the surface of this organ possesses them in abundance. In the carnivorous and herbivorous mammalia, whose extremities are furnished with claws, or encased in hoofs, we find the lips and the parts surrounding the nostrils to be the chief seat of tactile sensibility, and to be copiously furnished with papillæ; this is especially the case with those which have the lips or nostrils prolonged into a snout or proboscis—as in the pig, the rhinoceros, the tapir, and the elephant.

'In the mole, too, the papillary structure is remarkably developed at the extremity of the snout. The only part of the skin of birds on which tactile papillæ have been discovered is on the under surface of the toes, and on the web of the palmipedes, where they obviously receive impressions which guide the prehensile and other movements of the feet. In many lizards, a papillary structure is found on the under surface of the toes; and in the chameleon, it exists also on the integument of its prehensile tail..... In serpents and chelonians (tortoises), no papillary apparatus has as yet been detected; and in fishes and invertebrata, its presence has not been ascertained, although it would appear that certain parts, especially the tentacles around the mouth, are endowed with a high degree of tactile sensibilty.'—*Op. cit.*, p. 1166. It is probable that in all animals which have a soft fleshy tongue furnished with papillæ, this organ is an instrument of tactile sensibility as well as the organ of taste. Besides the papillary apparatus, certain animals have special organs of touch, constructed on a totally different plan, and 'consisting of a rod or filament, which is in itself insensible, but which is connected at its base with nervous fibres in such a manner that any motion or vibration communicated to it must be transmitted to them.' The so-called 'whiskers' of the cats and certain rodents, as the hare and rabbit, belong to this class; and it has been proved, experimentally, that if they be cut off, the animal loses, to a great extent, its power of guiding its movements in the dark.

Amongst the conditions necessary for the exercise of the sense of touch are (1) a normal condition of the papillary apparatus and of the nerves supplying it; (2) a due supply of blood to the tactile organs; and (3), as has been noticed in the article TASTE, a temperature not too far removed from the natural heat of the body. It has been shown by Professor Weber, that if the fingers or the lips be immersed for half a minute or a minute in water heated to 125°, or cooled to 32°, the power of distinguishing between a hot or cold fluid or solid body is for the time completely lost, a feeling of pain alone being experienced. The result was the same on applying cold to the trunk of a nerve, the ulnar nerve at the elbow, where it lies just beneath the skin, being selected for the experiment. The fingers supplied by this nerve soon lost the power of distinguishing between heat and cold, and could only imperfectly perceive the contact and pressure of bodies.

The above named physiologist has made a large number of experiments on the general subject of Touch. His investigations regarding the tactile discrimination in different parts of the skin have been noticed in the article SENSIBILITY. Professor Valentin, whose results, on the whole, correspond very closely with those of Weber, found, however, a considerable extent of individual variation, some persons being able to distinguish the separate compass-points at half, or even one-third of the distances required by others.

There is no sense which is so capable of improvement as that of touch. Of this power of improving the delicacy of touch, says Dr. Carpenter, 'we have examples in the case of certain artisans, whose employments require them to cultivate their tactile discrimination; thus, the female silk-throwsters of Bengal are said to be able to distinguish by the touch alone *twenty* different degrees of fineness in the unwound cocoons, which are sorted accordingly; and the Indian muslin-weaver contrives by the delicacy of his touch to make the finest cambric in a loom of such simple construction that European fingers could at best propose to make a piece of canvas at it.' The highest degree of tactile sensibility is met with in blind persons—a circumstance which is to be attributed for the most part to the concentration of the attention and of the powers of recollection and comparison which are brought to bear upon the mind; and probably to some extent to an increased development of the tactile organs themselves, resulting, as the above-named physiologist suggests, 'from that augmented nutrition which would be the natural consequence of the frequent use of them, and of the increased flow of blood that seems to take place towards any part on which the attention is constantly fixed.' —For much interesting information on this subject the reader is referred to Dr. Kitto's *Lost Senses*, in which cases, apparently quite authentic, are given of blind persons being able to distinguish colors by the touch.

TOUCH-HOLE, or VENT. See GUN.

TOUCH-PAPER. See NITRE.

TOUCH-STONE, a hard black stone, occasionally used in assaying. The best kind is a peculiar bituminous quartz obtained from Lydia, in Asia Minor; but black basalt may be employed. The process is as follows: A series of 'needles' or small bars are formed, the first consisting of pure gold; the second, of 23 of gold and 1 of copper; the third, of 22 of gold and 2 of copper, and so on. The assayer selects one of these alloys, or 'needles,' which, from its color, he judges to approach nearest in composition to the alloy which he is about to assay. This he rubs on the stone, and the streak which it leaves is red in proportion to the copper that is present. The streak formed by the alloy to be assayed is then compared with that formed by the various 'needles,' and corresponding streaks indicate corresponding amounts of copper.

Hence, an approximate estimate of the amount of copper in an alloy can be made.—See Miller's *Inorganic Chemistry*, 2d ed., p. 739, *note*.

TOUCH-WOOD is the wood of willows and some other trees softened by decay. It is used as tinder for obtaining fire, from the readiness with which a spark ignites it.

TOUL, a fortified town of France, dep. of Meurthe-et-Moselle. On Sept. 23, 1870, this fortress surrendered to the Germans after a bombardment of three days' duration. It has an old cathedral, which took more than five centuries to finish (965—1496), and which is reckoned one of the most splendid in France. Cotton, woollen, lace, and fayence manufactures are carried on. Pop. (1876) 9566.

TOU'LA, or TULA, one of the governments of Great Russia, bounded on the N. by the government of Moscow. Area, 11,909 sq. m.; pop. (1880) 1,279,715. The surface is for the most part level; the climate is temperate; the soil, fertile. The Oka is the only river which is navigable throughout the government, and the other streams are tributaries either of the Oka or the Don. The surface is in general dry, there being no lakes or marsh-lands, and forests are rare. The inhabitants are occupied chiefly in agriculture, cattle-breeding, the manufacture of pottery, fishing, and the working of iron mines.

TOULA, or TULA, an important manufacturing town of Great Russia, capital of the government of the same name, on the Upa, an affluent of the Oka, 110 miles south of Moscow. Its 28 churches, its arsenal, theater, industrial museum, cathedral, and the ancient Kreml are the principal buildings. T. is an ancient town, and has suffered severely from Tartar invasion, and during the wars of the commencement of the 17th century. Iron-works founded here under Czar Alexis Michailovitch have acquired a well-merited reputation. The Russian army is largely supplied with muskets and small-arms from the works of this town. Cutlery, locks, tea-urns, and bells are made in great perfection; and bristles are prepared in large quantities both for home consumption and export. Pop. (1880) 57,400.

TOULON, a great seaport and naval arsenal of France, in the dep. of Var, stands on the shore of the Mediterranean, 37 miles south-east of Marseille, with which it is connected by railway. It stands at the head of a deeply penetrating inlet or gulf, rises in the form of an amphitheater towards the north, where its ramparts extend to the foot of a chain of lofty elevations, in part clothed with beautiful forests. The port is divided into two parts, the old and the new; the former, on the east, appropriated to merchant-vessels, and bordered by a quay; the latter, on the west, surrounded by the dockyard, slips, arsenal, store-houses, cannon-foundry, &c. Numerous forts defend the town on the land-side; and the mouth of the harbor, and the hills commanding it, are studded with forts and redoubts; while moles, hollow and bomb-proof, and formed externally into batteries, level with the water's edge, separate the roadstead from the old and new ports. Belonging to the arsenal, which is perhaps the finest in France, the chief objects of attraction are the sail-yard, the armory, the museum, the magazine, and the basin for the repair of ships. The fortifications of the town have been greatly extended since the conquest of Algeria, T. having become the chief port of communication with Africa. The population has also greatly increased, and two new suburbs have been constructed. The town is surrounded by a double rampart, and by a wide and deep fosse. The streets are straight and wide; and, on the whole, the town is both agreeable and healthy. This town is the Plymouth of France; and its industry consists, for the most part, of those manufactures to which its position as a great naval arsenal gives rise. Pop. (1881) 69,474.

T. was destroyed by the Saracens in 889, and again by the Saracens about the close of the 12th century. It is only at the end of the 16th c. that T. comes to be important as a naval and military stronghold. It was taken by the English and Spaniards in 1793; but the allies were obliged to evacuate the town in December of the same year, after being fiercely attacked by the Republicans, whose guns were commanded by Napoleon—then a simple officer of artillery—who here evinced for the first time his genius and self-reliance.

TOULOUSE (anc. *Tolosa*), an important city in the south of France, capital of the dep. of the Haute-Garonne, is situated in a broad and pleasant plain, on the right bank of the river Garonne, 160 miles by railway south-east of Bordeaux. Pop. (1881) 136,627. The *Canal du Midi* sweeps round its eastern and northern sides. The Garonne is here crossed by a beautiful bridge upwards of 810 feet in length, and 72 broad, which connects T. with the suburb of St. Cyprien. The city, with the exception of the southern faubourg, is not particularly handsome (though the broad quays have rather an imposing appearance), and there are few fine public buildings. One may note, however, the cathedral, containing the tombs of the counts of Toulouse; the *Capitole*, or town-hall; the church of St. Sernin (1090 A.D.); the Musée, with its interesting collection of antiquities, forming an almost uninterrupted chain in the history of art, from the Gallo-Roman to the Renaissance period. T. is the seat of an archbishop, has a university academy, an academy of 'floral games' (*Société des Jeux Floraux*), pretending to derive its origin from the contests of the ancient troubadours, academies of arts, sciences, antiquities, &c., schools of law, and medicine, and artillery, a national college, an observatory, a museum, botanic garden, and a public library of 50,000 volumes. T. manufactures woollens, silks, leather, cannon, steam-engines, tobacco, brandy, &c., and carries on a great trade with Spain. Its duck-liver and truffle pies are celebrated throughout the south of France.

History.—Tolosa was, in Cæsar's time, a city within the limits of the Roman *Provincia*, and had been originally the capital of the Volcæ Tectosages, a Gallic tribe noted for its wealth and consequence. Under the empire its importance continued. Ausonius describes it as surrounded by a brick wall of great circuit, and so populous that it had founded four colonies. In 412 A.D., the Visigoths made it the capital of their kingdom; and after the time of Charlemagne, it was under the sway of counts, who made themselves independent about 920, but in 1271 the 'county of T.' was reunited to the crown of France by Philippe *le Hardi*. Its literary celebrity reaches as far back as the Roman Empire. Ausonius speaks of the *toga docta* of 'Palladian' Tolosa, and the favorite deities of the city were Jupiter, Minerva, and Apollo. At a little village close by, which still bears the name of *Viel Toulouse*, a multitude of cinerary urns, statuettes, Phœnician, Celtiberian, Gallic, Greek, and Roman medals, fragments of buildings, and an entire paved street have been discovered. Early in the middle ages, under the Counts of T. it became a seat of Provençal poetry, and was the center of the papal crusade against the Albigenses, conducted by Simon de Montfort. The parliament of T. had also a great reputation, but unhappily it is likely to be best remembered by one of its most iniquitous decisions, that delivered in the case of the Calais (q. v.) family.

TOURAINE, one of the former provinces of France, of which the capital was Tours (q. v.), and which was bounded on the N. by the province of Orleannais, on the E. by Berri, on the S. by Poitou, and on the W. by Anjou. It was about 60 miles in length, and nearly the same number of miles in breadth, and it appears on the map now as the department of Indre-et-Loire.

TOURCOING, a frontier town of France, dep. of Nord, 7½ miles north-east of Lille, is built on an eminence in the midst of a fertile territory. It has a great reputation for its manufacture of linen-cloths, and also carries on sugar-refining, distilling, and manufactures of soap, colors, &c. Pop. (1876) 33,013 (1881) 50,268.

TOU'RMALINE, a mineral ranked amongst Gems (q. v.), and occurring in primitive rocks in many parts of the world. Its chemical composition is very complex and somewhat various, but the chief constituents are always silica and alumina in about equal proportions, and forming about three-fourths of the whole; the remainder consisting of boracic acid, fluorine, phosphoric acid, peroxide of iron, peroxide of manganese, protoxide of iron, magnesia, lime, soda, potash, and lithia, which are not, however, all present in any specimen. T. is harder than quartz, but not so hard as topaz or emerald. Its specific gravity is a little more than 3. It occurs in crystals, or massive and disseminated, although always crystalline. Its lustre is vitreous. Some varieties are transparent, some translucent, some opaque. Some are colorless, some green, brown, red, blue, and black. Red T. is known as *Rubellite;* Blue T., as *Indicollite;* and Black T., as *Schorl*. This last is the most common kind. T. crystallizes in prisms, with 3, 4, or 9 sides, variously acuminated. The sides of the prisms are striated. The finest tourmalines are much valued by jewelers, but are comparatively rare. They mostly come from Ceylon, Siberia, and Brazil. Tourmalines are found in several parts of Britain. Very large crystals abound in the granite of Aberdeenshire.

TOU'RNAMENT (Fr. *tournoi*, from *tournoyer*, to turn round), a military sport of the middle ages, in which combatants engaged one another with the object of exhibiting their courage, prowess, and skill in the use of arms. The invention of the tournament has been ascribed to Geoffroy de Prenilly, ancestor of the Counts of Anjou, who lived in the 10th c.: France was its earliest *locale*, whence it spread first to Germany and England, and afterwards to the south of Europe. A tournament was usually held on the invitation of some prince, who sent a king-of-arms or herald through his own dominions and to foreign courts signifying his intention of holding a tournament and a clashing of swords in presence of ladies and damsels. The intending combatants hung up their armorial shields on the trees, tents, and pavilions round the arena for inspection, to show that they were worthy candidates for the honor of contending in the lists in respect of noble birth, military prowess, and unspotted character. The combat took place on horseback, or at least was always begun on horseback, though the

combatants who had been dismounted frequently continued it on foot. The usual arms were blunted lances or swords; but the ordinary arms of warfare, called arms *à l'outrance*, were sometimes used by cavaliers who were ambitious of special distinction. Tournaments were the subject of minute regulations, which in some degree diminished their danger. The prize was bestowed by the lady of the tournament on the knight to whom it had been adjudged, he reverently approaching her, and saluting her and her two attendants. The period when tournaments were most in vogue comprised the 12th, 13th, and 14th centuries; and the place where the most celebrated English tournaments were held was the tilt-yard near St. James's, Smithfield, London. The church at first discountenanced tournaments, some of its decrees prohibiting persons from engaging in them under pain of excommunication, and denying Christian burial to a combatant who lost his life in one. The church seems, however, to have looked with more favor on these combats after the middle of the 13th century.

During the 15th and 16th centuries, tournaments continued to be held, but the alteration in the social life and warfare of Europe had changed their character, and they are rather to be regarded as state pageants than as real combats. The death of Henry II. of France, in 1559, consequent on the loss of his eye at a tournament, led to their general abandonment, both in France and elsewhere, and there have been few attempts to revive them even as mere spectacles. A magnificent entertainment, consisting of a representation of the old tournament, was given at Eglinton Castle in 1839, by the late Earl of Eglinton: Lady Seymour was the Queen of Beauty, and many of the visitors enacted the part of ancient knights; among them Prince Louis Bonaparte, afterwards Napoleon III.—According to Ducange, the difference between a tournament and a JOUST, is that the latter is a single combat, while in the former a troop of combatants encounter each other on either side. But this distinction has not been always observed.

TOURNAY (Flemish, *Doornik*), a fortified town of Belgium, province of Hainault, on both sides of the Scheldt, near the French frontier. It has a splendid cathedral with five towers (and pictures by Jordaens, Rubens, Gallait, &c.), several fine churches, particularly St. Quentin and St. Jacques, a gallery of art, an episcopal seminary, five hospitals, and a lunatic asylum. Although one of the oldest towns in Belgium, it has quite a modern appearance, with fine suburbs and beautiful broad streets. The chief manufactures are hosiery, linen, carpets, and porcelain; but there are few large workshops, most of the fabrics being executed by the people in their own houses. Pop. (1880) 32,566. A little to the south-east lies the famous village of Fontenoy (q. v.).

T., the ancient *Tornacum* or *Turris Nerviorum* ('Fort of the Nervii'), was in the 5th and beginning of the 6th centuries the seat of the Merovingian kings, subsequently belonged to France, but at the Peace of Madrid was included in the Spanish Netherlands. Subsequently, it was oftener than once taken by France, but again restored by treaty. During the month of May 1794, it was the scene of several hotly-contested fights between the French and Austro-English armies, the most important of which was that of the 19th May, in which Pichegru beat the Duke of York.

TOURNEFORT, JOSEPH PITTON DE, one of the greatest botanists of the 17th c., born at Aix, in Provence, in 1656. He exhibited an ardent love of botany from his youth, and devoted his whole life to this science. After having explored the flora of his native district, he was sent, at the king's expense, to Spain, Portugal, England, and Holland, and afterwards to the East. He visited the Grecian Archipelago and Thrace, the shores of the Black Sea, and Asia Minor, and added a great number of species to the list of known plants. He lost his life in 1708, in consequence of a carriage running against him in Paris. He published several botanical works, and a *Voyage to the Levant*. His botanical system, which maintained its ground till the time of Linnæus, was of great use in promoting the progress of botany; but he rendered still greater service to his favorite science by grouping plants in genera. He was the first to do so. Previous botanists had merely described them individually, as species.

TOU'RNIQUET, an instrument for compressing the main artery of the thigh or arm, either for the purpose of preventing too great a loss of blood in amputation, or to check dangerous hæmorrhage from accidental wounds, or to stop the circulation through an aneurism.

The common tourniquet consists of three parts—viz., (1) a pad to compress the artery; (2) a strong band which is buckled round the limb; and (3) a bridge-like contrivance over which the band passes, with a screw whose action raises the bridge and consequently tightens the band. The best kind of pad is a small firm roller about an inch thick; it must be placed lengthways over the main artery so as to compress it against the bone, and must be secured in its place by a turn of bandage, over which the band of the tourniquet must be applied. This band must first be tightly buckled, and the pressure must be then increased to the necessary extent (namely, till the beating of the artery beyond the instrument ceases to be perceptible) by the action of the screw, which should always be opposite the buckle of the band. As the instrument arrests the venous blood, it should never be applied tightly in cases of amputation, until the surgeon is ready to make his incision, as otherwise there would an excessive loss of venous blood.

Common Tourniquet.

The credit of the invention of this most useful instrument is usually ascribed to the French surgeon Morel, who, in 1674, used a stick passed beneath a fillet, and turned round so as to twist it up to the requisite degree of tightness, as a means of preventing the undue loss of arterial blood in amputations of the limbs—a rough, but by no means ineffectual form of tourniquet, which may often be usefully extemporized in cases of emergency at the present time. Mr. Young of Plymouth, in 1679, described a similar apparatus. A much improved screw tourniquet was invented by Petit early in the following century.

TOUROUKCHA'NSK, a small town of East Siberia, in the government of Yeneseisk, stands on the Yenesei, 4122 miles east of St. Petersburg, and only 50 miles south of the Arctic circle. Pop. (1880) 300, who trade in furs.

TOURS, a city of France, capital of the dep. of Indre-et-Loire, and formerly capital of Touraine, stands in the midst of a fertile but flat valley, 146 miles by railway south-west of Paris. Along its north side runs the Loire, and along its south side the Cher—these two rivers uniting about 25 miles south-west of the city, between which and their point of confluence only a very narrow strip of land separates them. The bridge over the Loire, which continues the great highway from Paris south to Bordeaux, is upwards of 1400 feet long. The cathedral is a stately Gothic edifice. Surrounding the choir—begun in 1170—there is beautiful old painted glass. The Tour de St. Martin or d'Horloge, and the Tour de Charlemagne, are noteworthy as being the only remains of the cathedral founded by St. Martin in the 4th century. The church was pillaged by the Huguenots, and utterly destroyed, with the exception of the two towers mentioned, at the Revolution. T. has a town-hall and a museum. A little to the west of T. are the remains of Plessis les Tours, in which Louis XI. died in 1483. Manufactures of silk stuffs, carpets, painted glass, and pottery are carried on. Pop. (1881) 52,510.

T., the ancient *Cæsarodunum*, dates from the time of the Gauls, and was visited by Cæsar and by Adrian. Here Clovis, having come to thank St. Martin for the victory of Vouillé, received the crown of gold and the purple robe presented to him by the Emperor Anastasius. Henry IV. planted the first mulberry-trees known in France here, and here the first silk-factories were established. Under Richelieu, 40,000 hands were employed at T. in this branch of manufacture; but the industry of the town was ruined by the revocation of the Edict of Nantes. In the Franco-German war of 1870—71, T. was for a time the seat of the French Provisional Government, and was occupied by the German troops.

TOURVILLE, ANNE HILARION DE COTENTIN, COUNT DE, third son of César de Cotentin, seigneur de Tourville, was born at Tourville in 1642. Entering the French navy when about eighteen, it seems that his somewhat delicate and effeminate appearance caused him to be regarded as anything but a hopeful seaman. He became, however, almost immediately conspicuous for bravery and enterprise; and the first six years of his naval service, directed against the Turks and Algerians, established his reputation both in France and in the south of Europe. In 1667, he was received at Versailles with great distinction by Louis XIV. In

1669, he distinguished himself in the expedition sent by France to the relief of Candia, then besieged by the Turks; and again in 1671—1672, in the naval war waged by the combined fleets of France and England against the Dutch. In 1682, he was made lieutenant-general of the navy, and for the following two or three years he was engaged in suppressing the pirates of Algiers and Tripoli. In the war which broke out after the English revolution of 1688, between France on the one part, and England and Holland on the other, T. was put at the head of the French navy. In June 1690, he entered the English Channel at the head of a powerful fleet, and inflicted a disastrous and ignominious defeat on the united English and Dutch armament near Beachy Head. 'There has scarcely ever been so sad a day in London,' says Macaulay, 'as that on which the news of the battle of Beachy Head arrived.' T. ranged the Channel unopposed; and on 22d July his fleet cast anchor in Torbay (see Macaulay, *History of England*, vol. iii. p. 652—654, ed. 1855). In 1692, Louis XIV. having resolved to invade England on behalf of James II., an immense fleet was assembled at Brest under T., in order to protect the descent. On the 16th May of this year the French fleet was described from the cliffs of Portland, and on the following morning the English and Dutch force stood out to give battle. From the morning of the 19th to the afternoon of the 24th, raged one of the greatest naval battles of modern times, that of Cape La Hogue. It ended in the complete defeat of the French, 16 of their men-of-war being utterly destroyed.

In spite of this disaster T. was graciously received at Versailles: 'We have been beaten,' said Louis to him, 'but your honor and that of the nation are unsullied' (see *Memoirs of St. Simon*). On 27th March 1693, T. was made a Marshal of France. Sailing from Brest harbor in the spring of this year, he attacked an English merchant fleet under inadequate convoy, and succeeded in inflicting a damage on English traders estimated at some millions sterling. Sir George Rooke, who commanded the convoy, had some difficulty in saving his own squadron from destruction. This was the last exploit of the great French admiral; his career ending with the peace of Ryswick in 1697. He died at Paris, 28th May 1701. It has been said of T. that he was competent to fill any place on board ship, from that of carpenter to that of admiral. It has also been said of him, that to the dauntless courage of a sailor he united the suavity and urbanity of an accomplished gentleman. But though a brave man, he was, during the earlier part of his career, a timid commander. Reckless of his life, he was often pusillanimously cautious where his professional reputation was at stake. Latterly, stung by the censures drawn on him by his natural disposition, he became bold even to rashness.

TOUS-LES-MOIS, a starch made in the West Indies, from the roots of a species of canna (see INDIAN SHOT); it is used as a substitute for arrow-root.

TOUSSAINT, ANNA LOUISA GERTRUDE, one of the most popular living Dutch novelists, was born at Alkmaar, September 16, 1812, where her father, a highly esteemed lecturer on chemistry, died in 1859. After the revocation of the Edict of Nantes, her paternal ancestors fled from France, and took refuge, first at Hanau, and later in Friesland, where they ranked among the nobility, but were reduced in circumstances during the French usurpation. By the mother's side, she is also of a refugee family of the name of Rocquette, belonging to the higher class of merchants and manufacturers. Her first work, *Almagro*, published in 1837, was well received, and translated into German.

Speedily followed *De Graaf van Devonshire*, an episode in the early life of Elizabeth Tudor; then *De Engelschen te Rome*, a historical novel of the times of Pope Sixtus V.; in 1840, the *Huis Lauernessé*, a story of the Reformation, which has gone through several editions, and been translated into German and English. Her popularity was increased by a series of novels in 10 volumes, 1845—55, under the titles of *De Graaf van Leycester in Nederland*, (The Earl of Leicester in the Netherlands), *De Vrouwen van het Leycestersche tijdperk* (The Women of the Times of Leicester), and *Gideon Florentz*. Her other works are numerous, including *Cardinal Ximenes*, *The Duke of Alba in Spain*, *The Princes Orsini*, *De Maulëon*, *Don Abbondio II.*, *Mother-joy and Mother-grief*, *The Orphan of Alkmaar*, *The Leyden Student in* 1593, *The Biography of the Landscape Painter Maria van Oosterwijk*, and *Major Frank*. The writings of T. are everywhere characterized by historical accuracy, and show a Christian spirit and tendency. In 1845, the magistrates of Alkmaar gave her a handsome present. In 1851, she married Johannes Bosboom, a distinguished painter, and has since resided at the Hague. Besides other honors, her husband obtained the gold medal at Brussels in 1842, and for paintings of churches, the large gold medal at the Paris Exhibition in 1855.

TOUSSAINT, FRANÇOIS DOMINIQUE, surnamed L'OUVERTURE, was born at Buda, in St. Domingo, in 1743. His father and mother were both African slaves. When the French Revolution broke out, it found him in the position of coachman to a M. de Libertat, who appears also to have employed him as a sort of sub-manager of an estate for which he was himself the factor. In 1791, the French Convention passed the memorable decree, by which the rights of French citizens were given to people of color. In the revolutionary strife which followed in St. Domingo, T. was, for the next three years, conspicuous for his adherence to the cause of royalty and Catholicism; but the decree of February 4, 1794, which declared all slaves free, won him over to the side of the French republic. He joined their commander, Laveaux, by whom he was made a general of division. In 1793, in the midst of the troubles, the British had landed a force and taken partial possession of the island. Against them T. now proved himself an able and indefatigable enemy, bringing the whole of the northern division of the island under the dominion of the French republic. In 1795, in consequence of a conspiracy of three mulatto generals, Laveaux was arrested at Cape Town; but T., assembling his negroes, and uniting himself to the French force, quickly effected the release of the governor. The gratitude of Laveaux was very great; and, in 1796, the Commissioners of the Directory appointed T. chief of the army of St. Domingo. Shortly after this event, General Maitland, the British commander, surrendered to him all the strong places which he had hitherto held in the island. This was followed in 1801 by the submission of the Spanish forts. The whole of St. Domingo was then under the rule of Toussaint. His sway was vigorous and upright; and the agriculture and trade of the island both flourished under him. He was now at the summit of his prosperity. He assumed great state, though still retaining habits of personal simplicity. But a more powerful despot now found himself at leisure to interfere in the affairs of the island.

During the peace of Amiens, Napoleon Bonaparte issued a proclamation re-establishing slavery in St. Domingo. This was met by a counter-proclamation by T., issued on December 18, 1801, in which, while professing obedience, he showed plainly that he meant resistance. A squadron of 54 sail of the line, under General Le Clerc, very soon made its appearance to enforce the edict of the first consul. T. was obliged to retire, was proclaimed an outlaw, and, agreeing to surrender, was received with military honors. He was afterwards treacherously arrested, and sent to Paris, where, after ten months of rigorous imprisonment, he died on April 27, 1803.—See *Vie de Toussaint l'Ouverture*, by St. Remy (Par. 1850); and *The Life of T.*, by Dr. Beard (Lond. 1853).

TOWER HAMLETS, a parliamentary borough in Middlesex, lying in the east of London, and having the City and Finsbury to the west of it. It contains the parish of St. George-in-the-East, the hamlet of Mile-End Old Town, the unions of Poplar, Stepney, and Whitechapel, and the Tower of London. In T. H. are the Mint, Trinity House, St. Katharine's Docks, the East and West India, South, and London Docks, the London Hospital, and various charitable institutions. The T. H. send two representatives to parliament. Pop. of borough (1881) 438,910.

TOWER OF LONDON, in feudal days, a powerful fortress; then, and long after, a state prison of gloomy memories; now, a government storehouse and armory, and still, in some sense, a stronghold, is an irregular quadrilateral collection of buildings on rising ground adjoining the Thames, and immediately to the east of the city of London. The space occupied is between 12 and 13 acres, and the whole is surrounded by a moat of fair width, but no great depth. Usually, the moat is dry, but the garrison have the power of flooding it.

Seen from without, the moat is bordered within by a lofty castellated wall, broken by massive flanking-towers at frequent intervals. Within this wall rises a second of similar construction, but greater height; and within this, again, are the several barracks, armories, &c.; and in the center of all, the lofty keep or donjon known as the White Tower. This last, which nearly resembles Rochester Castle, and like it, was built by Gundulph, Bishop of Rochester, in the time of William the Conqueror, is the center of interest and antiquity in the whole structure. Its walls are in parts 16 feet thick, and of solid masonry. This tower was the court of the Plantagenet kings. The various other towers are principally noteworthy on account of the illustrious prisoners who have pined in them, or left them for the scaffold. In the northwest corner of the quadrangle is St. Peter's Chapel, now the garrison church. In another part is the Jewel-house, containing the crown jewels, or *Regalia*, comprising several crowns, sceptres, globes, and jewels of enormous value. Near this building is the Horse-armory, a collection of ancient and mediæval arms and armor, the latter being exhibited in complete suits on wooden figures of men and horses. To the crown jewels and the armory, visitors are admitted on payment of a small fee.

Early writers have alleged that Julius Cæsar first built the Tower of London as a Roman fortress; but there is no written evidence to prove the existence of any fortress on this site before the construction of the White Tower by Bishop Gundulph in 1078. Some earlier structure of the Saxon times appears to have been

there, from the massive foundations which have been discovered in the course of subsequent erections; but of the nature of those buildings we know nothing. During the reigns of the first two Norman kings, the Tower seems to have been used as a fortress merely. In Henry I.'s time, it was already a state prison. That monarch and his successors gradually increased the size and strength of the ramparts and towers, until the whole became a stronghold of the first class for feudal times. The kings frequently resided there, holding their courts, and not unfrequently sustaining sieges and blockades from their rebellious subjects. Of the long list of executions for political offences, real or imputed, that of Lords Kilmarnock, Balmerino, and Lovat, after the Rebellion of 1745, was the last. Wilkes, Horne Tooke, and others have since been confined there; but happily, blood has ceased to flow since the existence of a living opposition has been found consistent with the safety of the government.

Not the least interesting memorials are the quaint and touching inscriptions cut by hapless prisoners on the walls of their dungeons.

In 1841, a very serious fire broke out in the Bowyer Tower, and extended to the armories, causing the destruction of numerous modern buildings and many thousand stand-of-arms. At present, the Tower of London is a great military storehouse in charge of the War Department, containing arms and accoutrements for the complete equipment of a large army. The Mint and Public Records were formerly kept in it, but have now been removed to other buildings more suitable. Flamsteed, when first appointed Astronomer-royal, made his observations from the summit of the White Tower; afterwards, he removed to Greenwich. It is needless to say that, viewed as a fortress, the Tower would be useless against modern arms.

The government is vested in a Constable, who has great privileges, and is usually a military officer of long service and distinguished mark; the Deputy-constable, also a general officer of repute, is the actual governor. He has a small staff under him, and the corps of Yeomen of the Guard, more commonly known as Beefeaters. In addition, a wing, and occasionally a battalion, of infantry is quartered in the barracks.—Bayley's *History of the Tower of London*, 2 vols. 4to.; *Memoirs of the Tower*, by Britton and Brayley (1831); *Memorials of the Tower of London*, by Lord De Ros (1866); *Her Majesty's Tower*, by Hepworth Dixon, 4 vols. (1871).

TOWN-ADJUTANT, TOWN-MAJOR, officers on the staff of a garrison. They are often veteran officers, too much worn for field-service. The pay depends on the magnitude of the trust. The town-major ranks as a captain: the adjutant as a lieutenant. The duties of these officers consist in maintaining discipline, and looking after the finding of the batteries, &c.

TOWN-CLERK is the clerk to a municipal corporation, elected by the town-council. In England, he holds his office during pleasure, and his salary is paid out of the borough funds. His duties are: to take charge of the voting-papers in the election of councilors, to keep the records of the borough and lists of burgesses, and to perform a variety of miscellaneous duties imposed by sundry acts of parliament.—In Scotland, he holds his office *ad vitam aut culpam*, is the advisor of the magistrates and council in the discharge of their judicial and administrative functions, attends their meetings, records their proceedings, is the proper custodier of the records of the burgh, and keeper of the registers of sasines and deeds within it. Various important statutory duties are also assigned to him in relation to the registration of voters, the conduct of municipal elections, the valuation of lands and heritages, the registration of births, marriages, and deaths, the licensing of public-houses, &c. In the performance of a large proportion of these duties, he is independent of the town-council, who cannot make his appointment during pleasure, or attach to it any condition which might enable the council either to control him in the conduct of the business of his office, or withdraw from him any portion of his emoluments, so far as derived from fees. Being thus protected in the independent and impartial discharge of his functions as a public officer, he is bound to give extracts from the records in his custody without reference to the town-council, and is liable *personally* for the consequences of failure in any department of his duty. He is not, however, a magistrate in any sense, and cannot be held responsible for the obligations of the burgh, or for the omissions or neglect of the magistrates and council.

TOWN-COUNCIL is the governing body in a municipal corporation, elected by the ratepayers. The town-council administers the affairs of the borough in relation to its common property and to a variety of other matters, appointing the several officers required for this purpose. It is also charged with important functions in regard to police and sanitary matters; and the tendency of recent legislation is to concentrate in the council all matters of local administration. For the more effectual government of the community under its jurisdiction, the council is empowered to make by-laws, like local statutes, so far as not inconsistent with common law or public statute, or the constitution of the borough. One-third of the council go out of office every year, but are eligible for re-election at the annual elections in November. In all the corporate or borough towns of England (except London, and a few other places specially excluded from the Municipal Corporation Act, 5 and 6 Will. IV. c. 76), the town-council consists of the mayor, aldermen, and councilors. The councilors vary in number from 12 to 64 according to the population of the town; and one-third of the number are aldermen. Every burgess who is enrolled in the burgess-roll—i. e. every inhabitant householder (who has been for one year, in respect of property, rated to the poor) in the borough, or within seven miles of the borough—is entitled to vote in the election. See BURGESS. The council elects the mayor, who continues in office for one year. The aldermen are elected from the councilors, or from persons qualified to be councilors. In the larger boroughs, a person is not qualified to be a councilor unless he is worth £1000, or is rated for the support of the poor to the extent of £30 and upwards; but in the smaller boroughs, he is qualified if worth £500, or rated for the poor at £15.—In Scotland, the town-council consists of the provost (in burghs which have a provost), bailies, treasurer, and common councilors, with the addition, in Aberbeen, Dundee, and Perth of the dean of guild, and in Edinburgh and Glasgow, of the dean of guild and convener of the trades.

The election of councilors is regulated by 3 and 4 Will. IV. c. 76, and other acts mentioned below, under which every person who possesses the qualification requisite for voting in the election of the member of parliament, and who has resided for six months previous to the 30th June in or within seven miles of the royalty, is entitled to vote in the election of councilors. The persons entitled to be registered as parliamentary electors in burghs, are those who are of full age, and not subject to any legal incapacity, and have been for not less that twelve calendar months next preceding the last day of July, inhabitant occupiers, as owners or tenants, of any dwelling-house within the borough, and have paid, before 20th June, all poor-rates up to 15th May; also lodgers occupying lodgings worth ten pounds. But no person can vote who is in receipt of poor relief, or is merely a joint occupier of a dwelling-house. Every elector residing or carrying on business within the royalty is eligible as a councilor; and in burghs where burgesses exist, the person elected is made a burgess before induction. The number of councilors varies in different burghs. The larger burghs are divided into wards or districts, each of which elects its proportion of councilors, as the smaller burghs do the whole council. The provost (in burghs which have a provost), bailies, treasurer, and other office-bearers fixed by the set or usage of each burgh, are elected by the councilors, the provost and treasurer holding office for three years, and the other office-bearers for the unexpired period of their councilorship. Vacancies in the magistracy or council are filled up *ad interim* by the remaining members of council—the person so elected retiring at the succeeding annual election. In burghs returning members to parliament, and all royal burghs, the election of members of council is regulated by 3 and 4 Will. IV. c. 76, 31, and 32 Vict. c. 108, 33 and 34 Vict. c. 92, and the Ballot Act (1872), 35 and 36 Vict. c. 33. In those more ancient royal burghs which, on account of the smallness of the population, were exempted from the provisions of the 3 and 4 Will. IV. c. 76, the election of magistrates and councilors is conducted according to ancient practice.

Previous to the municipal reform acts in the reign of William IV., town-councils were generally close corporations; the members elected their successors; business was conducted in private; and corrupt practices, with a variety of other abuses, prevailed. The Ballot Act, 1872, which applies to England, Scotland, and Ireland, leaving, however, some slight variations in each kingdom, extended to contested municipal elections nearly all the enactments relating to the poll at parliamentary elections. In England, the mayor is the returning officer, who is to provide everything required for the purpose of a poll. The Ballot (q. v.) is the means provided for taking the poll, and minute directions are contained in the act for the carrying out of this practice. In Scotland, all municipal elections were directed by the Ballot Act (1872) to be conducted in the same manner in all respects as under the practice applicable to the royal burghs mentioned in Schedule C of the Act 3 and 4 Will. IV. c. 76—namely, Edinburgh, Glasgow, Aberdeen, Dundee, Perth, Dumfermline, Dumfries, and Inverness. Subject to this enactment, the poll at a contested municipal election is to be taken as in England. In Ireland, the same act directs that the provisions of the English Municipal Elections Act (1859) shall apply in relation to the nominations at Irish municipal elections; but in other respects the practice in taking the poll at a contested municipal election is to be the same as in England. Corrupt practices at municipal elections in England and Ireland are now inquired into by means of an election court presided over by a barrister, 35 and 36 Vict. c. 60. In England, town-councils may, at the expense of the borough and local funds, promote and oppose

bills in parliament for the public benefit, when sanctioned by special meetings, 35 and 36 Vict. c. 91.

TOWNSHEND, Charles, Viscount Townshend, English statesman, born 1676, was descended from a very ancient English family, which has been settled at Raynham, in Norfolk, since the reign of Henry I. His father, Horatio, had been a prominent member of the Presbyterian party before the Restoration, and having been one of the most forward in restoring the monarchy, was, by Charles II., made Baron in 1661, and Viscount in 1682. He died in 1687, when his son was only eleven years old. When he was of age to take his seat in the Upper House, he adopted his father's politics; but soon afterwards became a disciple of Lord Somers, and cordially co-operated with the Whigs. He was named by the Godolphin administration one of the commissioners for arranging the Union with Scotland, and was rewarded for his exertions by the captaincy of the yeomen of Queen Anne's Guard. He was then employed as a diplomatist; was joint-plenipotentiary with Marlborough at Gertruydenberg; and negotiated with the States-general the Barrier Treaty, which pledged the States-general to the Hanoverian succession, and England to procure the Spanish Low Countries for the United Provinces, as a barrier against France. In 1712, upon the formation of the Harley ministry, T. was dismissed from his places, and the Barrier Treaty was censured by the House of Commons, which voted that T. and all who had been concerned in the treaty were enemies to the queen and kingdom. This persecution raised him from the rank of a follower to the station of a leader. He maintained a close correspondence with the court of Hanover, and obtained the entire confidence of George I., who, on his accession to the throne of England, made him his chief minister.

While George I. was still at the Hague, on his way to his new kingdom, he made T. Secretary of State, with power to name his colleagues. He selected General, afterwards Earl, Stanhope, and formed a ministry entirely Whig in its party character. He strengthened it by the addition of Walpole, who, from being at first Paymaster of the Forces, was soon made Chancellor of the Exchequer and First Lord of the Treasury. The principal act of the government was the passing of the Septennial Bill, a bold and unconstitutional act. After the breaking up of the South Sea Bubble, and the deaths of Sunderland and Stanhope (q. v.), T. (1721) again became Secretary of State. But he was no longer the acknowledged leader of the Whigs. The superior talent of Walpole, his financial abilities, and his influence in the House of Commons, caused a change in the relative position of the two ministers, and converted those who had been so long friends and colleagues, and who were also connected by ties of marriage (for T. had married Walpole's sister), into rivals and enemies. An open and unseemly quarrel broke out between them. They seized each other by the collar, and then laid their hands upon their swords. The interposition of friends prevented a duel; and T., resigning the contest, retired to Raynham, to cultivate his paternal acres. Walpole, on being asked the cause of his difference with his brother-in-law, replied: 'As long as the firm was Townshend and Walpole, all did very well; but when it became Walpole and Townshend, things went wrong, and a separation ensued.' T. introduced the turnip into Norfolk from Germany, and thus effected a most beneficial revolution in agriculture. He steadily refused to re-appear in public life, and died in a good old age, in June 1738, leaving behind him a high reputation for integrity and steady consistency in sound and constitutional principles of government.

TOWNSHEND, Charles, The Right Hon., English orator and statesman, was second son of the third Viscount Townshend, and grandson of the foregoing. He was born in 1725, and entered the House of Commons in 1747, as a supporter of the Pelham (Whig) Administration. His first great speech was against the Marriage Bill in 1753, which gained him a great reputation for eloquence. Upon the dissolution of the Whig government, the Earl of Bute gained him by the offer of the post of Secretary at War. On Bute's resignation in 1763, he was appointed First Lord of Trade and the Plantations. By this time, the versatility of his political career had obtained him the appellation of 'the Weathercock.' In the Chatham ministry of 1766, he accepted the post of Chancellor of the Exchequer and leader of the House of Commons. When Lord Chatham, in a distempered state of mind, abdicated the post of First Minister, T. broke loose from all restraint, and manifested the greatest vanity, ambition, and arrogance. George Grenville, smarting under the defeat of his favorite scheme of taxing America, on one occasion, in the middle of his harangue, turned to the ministers: 'You are cowards,' he said; 'you are afraid of the Americans; you dare not tax America.' T.'s fiery temper was kindled, and he exclaimed: 'Dare not tax America! I dare tax America.' Grenville retorted: 'I wish to God I could see it!' and T. replied: 'I will, I will.' He was not allowed to forget his pledge; and finding the notion of an American revenue agreeable to the court, and not unpalatable to the House of Commons, he proposed and carried those measures that led to the separation of the American colonies.

T.'s wife was created a peeress, and he was about to be intrusted with the formation of a ministry, when he was carried away by a putrid fever (September 1767) in his 42d year. The difference between his contemporary reputation and his fame is very striking. He was ranked as an orator with Pitt. He was far more popular than the great commoner with the House of Commons; yet his name will not go down to posterity, save in the annals of his time. Burke called him 'the delight and ornament of the House of Commons.' Macaulay speaks of him as 'the most brilliant and versatile of mankind,' who had 'belonged to every party, and cared for none.' Earl Russell describes him as 'a man utterly without principle, whose brilliant talents only made more prominent his want of truth, honor, and consistency.' He married Caroline, daughter and heiress of John, second Duke of Argyll and Greenwich, and widow of the Earl of Dalkeith, and had the discrimination to select Adam Smith as the tutor and traveling-companion of his step-son, the youthful Duke of Buccleuch.

TOWNSHIP, in English Law, means a division of a parish in which there is a separate constable, and for which there may be separate overseers of the poor.

TOYS. The making of toys forms a very important industrial occupation. Large numbers are made in London, Birmingham, and other places in Great Britain; but by far the largest number are made in Germany and Switzerland. Nürnberg is especially important in this respect, a large portion of the inhabitants of that town being engaged in the manufacture and trade in toys. The value of the toys imported annually into Britain is about £500,000.

TOXICO'LOGY is the term commonly employed in Medical Jurisprudence to designate the science of poisons. It embraces the physical and chemical history of all known poisonous substances, the methods of testing for them, their action on the living body, the *post-mortem* results which they occasion, and (according to some writers) the medical treatment that should be adopted. The word has a somewhat far-fetched origin. The Greek word *toxicon* signifies 'anything relating to *toxon*, a bow;' hence, with the word *pharmacon*, a drug, it was used to designate 'poison for smearing arrows,' and finally, *poison* generally.

TRA'CERY, the beautiful forms in stone with which the arches of Gothic windows are filled or traced for the support of the glass. These forms vary with every variety of Gothic architecture. Gothic windows were at first narrow, and were covered

Fig. 1.

with a simple arch. Then two windows were grouped together, and an arch thrown over both. The space thus enclosed became part of the window, and was at first pierced with a circle, quatrefoil, or other opening (fig. 1). When three or more windows

Fig. 2.

were grouped under one arch, the *shield* or space in the arch became larger, and was pierced with apertures of various forms. In the early Pointed styles, these were usually circles filled with cinquefoils, trefoils, &c. (fig. 2). During the Decorated period

the tracery became more varied in form, being composed of squares, triangles, and other forms, filled with foils, and having the appearance of being packed together (fig. 3). This kind of

Fig. 3.

tracery is called 'Geometric.' The windows of the transition from Decorated to Perpendicular had tracery of a more flowing character, while that of the Perpendicular Period (q. v.) became almost entirely composed of vertical lines. The Flamboyant (q. v.) or contemporary style in France had tracery of a very different description—being as free and graceful as the other was straight and stiff.

Panels are often filled with tracery, the exteriors of the Perpendicular period being covered with such. The woodwork of all periods is filled with ornamental tracery.

TRACHE'A, THE, is sufficiently described in the article RESPIRATION. We have here only to notice those affections of this tube which require surgical or medical aid.

Foreign bodies occasionally pass through the larynx into the trachea. In cases of this kind, the patient who has had some foreign substance in his mouth which is supposed to have been swallowed, is seized with a convulsive cough, threatening suffocation, but subsiding after a time. The symptoms that then ensue vary with the weight and figure of the substance, and according as it is fixed or movable. A large and very irregular body may be impacted in the trachea, and may thus more or less obstruct the respiration on both sides of the chest; and this obstruction will probably soon be increased by the inflammatory products that are excited. A small heavy body will usually pass through the trachea into one of the bronchi (usually the right), or into one of its branches, obstructing respiration to a less extent.

'If the foreign body be allowed to remain, the progress of the symptoms presents much variety in different cases. Death may occur from spasm of the glottis, or, the foreign body being propelled upwards into the rima, death may take place by its mechanically preventing the passage of air, or rupture of one of the cerebral blood-vessels may be produced during one of the fits of coughing. At a later period the lungs may become congested and emphysematous, or bronchitis, pneumonia, or pleurisy may supervene.'—Gray's article on 'Injuries of the Neck,' in Holmes's *System of Surgery*, vol. ii. p. 306. Although inversion of the body, together with succussion and lateral movement of the larynx, has in some few cases been successful, it is now deemed advisable by the highest authorities to precede the attempt at removal by making an artificial opening into the windpipe. A free aperture is thus secured for respiration, spasm of the glottis is prevented, and the foreign body is commonly expelled through the artificial opening, or falls through the glottis into the mouth.

Rupture of the Trachea from external injury occasionally happens, and generally proves fatal in consequence of the rapid and extensive emphysema which usually ensues. It is too rare an accident to require a more special notice.

Wounds of the Trachea are sufficiently described in the article THROAT. With the exception of Croup (q. v.), there is no special disease of the trachea; and indeed in croup the trachea is seldom exclusively affected. Hence the term *Tracheitis*, used by some nosologists as synonymous with croup, is hardly warrantable. Similarly, in more advanced life, the trachea is doubtless often the seat of inflammation, but never the special and exclusive seat, and both the symptoms and treatment merge into those of bronchitis or laryngitis.

TRACHEO'TOMY AND LARYNGO'TOMY. The air-passages may be opened in three different situations—namely, through the crico-thyroid membrane (see LARNYX), when the operation is termed Laryngotomy; through the cricoid cartilage and the upper rings of the trachea, the operation being known as Laryngotracheotomy; and through the trachea, below the isthmus of the thyroid gland, constituting Tracheotomy proper. Laryngotomy and tracheotomy are more commonly performed than laryngotracheotomy, to which no further allusion is required. Laryngotomy is more quickly and easily performed, especially in adult males, and is less dangerous; tracheotomy is a more difficult, tedious, and dangerous operation, but in some cases (as, for example, where there is any necessity for introducing the forceps) must be selected. It is unnecessary to enter into details regarding the modes of performing these operations. When the operation is completed, a large curved tube to breathe through is inserted in the aperture, and secured round the neck with a tape.

A double tube or canula possesses many advantages, as, by withdrawing the inner one, which should slightly project at its lower extremity, it may be cleared of any mucus or blood that may have accumulated in it, without disturbing the wound. The calibre of the inner tube should always be sufficiently large to admit as much air as usually passes through the chink of the healthy glottis. The after-treatment is much the same as that required for wounds in the Throat (q. v.). 'Opening of the air-passages may be required,' says Mr. Gray, 'in any case of disease or injury which produces mechanical impediment to the passage of air from the mouth into the trachea; in cases of foreign substances in the air-passages; and in some cases of suspended animation where artificial inflation of the lungs cannot be performed by the ordinary means.'—Holmes's *System of Surgery*, vol. ii. p. 317. In the case of a foreign body, its situation will determine the seat of the incision. Amongst the cases in which tracheotomy is, or may be, required, are cut throat, acute laryngitis, croup, diphtheria, chronic inflammation and ulceration of the larynx, necrosis of the laryngeal cartilages; tumors, excrescences, or epithelial growth within the larynx; tumors (bronchocele, abscesses, &c.) external to the larynx or upper part of the trachea, and impeding respiration by pressure, &c. It has also been recommended, but with little advantage, in hydrophobia, tetanus, and severe forms of epilepsy, with the view of relieving the suffocating spasms that occur in these diseases. Laryngotomy may advantageously be resorted to in cases of spasm of the glottis, in inflammation with œdema of the cellular tissue of the larynx, in inflammation of the tongue, in tonsilitis and pharyngitis, if the swelling is so great as to produce symptoms of suffocation, &c.

TRACHO'MA (derived from the Greek *trachus*, rough) is the term employed in ophthalmic surgery to designate a granular condition of the mucous covering of the eyelids, often accompanied with haziness and vascularity of the cornea. It is one of the most serious *sequelæ* of purulent Ophthalmia (q. v.).

TRA'CHYTE, a volcanic rock, principally composed of Felspar (q. v.), confusedly agglomerated in crystals, which are usually very small. Crystals of mica and hornblende are often also present, and more rarely crystals of augite, all imbedded in a felspathic paste. The name is from the Greek *trachys*, rough; the rock being rough to the touch. *Trachytic Porphyry* is a porphyry essentially composed of trachyte. By some geologists, T. has been made the name of a class of volcanic rocks, in which Clinkstone, Obsidian, and Pumice are included.

TRACING-PAPER. See PAPER.

TRACTA'RIANISM, a remarkable and important movement in the English Church during the second quarter of the present century, which consisted in an endeavor to revive and bring into prominence the principles of antiquity, catholicity, and authority recognized in some portions of the Anglican formularies, in contrast to the Protestant sentiments long and widely prevailing. The name is derived from a series of papers entitled *Tracts for the Times*, published at Oxford during the years 1833—1841, hence called the 'Oxford Tracts.' The causes of this remarkable reaction it would be difficult to ascertain. The agitation of the question of Roman Catholic emancipation led, in some cases, to the study of Catholic theology, with a view to determine the real grounds of difference between the Roman and Anglican churches; and the religious and æsthetic tone of Wordsworth's poetry, still more developed in Keble's *Christian Year* (published in 1828), may have disposed some minds to sentiments to which it was akin.

The lectures of Bishop Lloyd, when Regius Professor of Divinity at Oxford about 1823, on the Prayer-book and the Council of Trent, are considered to have led the way to the teaching of the *Tracts*. But the immediate origin of the movement appears to have been the alarm aroused for the interests of the English Church on the occasion of the suppression by the reform government of some of the Irish sees, and threatened alienation of Irish church property. It is said that about that time a meeting of clergymen took place at Hadley, in Suffolk, at which measures were concerted for opposing the alleged latitudinarian tendencies of the day, and restoring the High Church theology of the Anglican divines of the 17th century. The chief promoters of the movement were the Rev. John Keble (q. v.), author of the *Christian Year*, and formerly Professor of Poetry at Oxford; Rev. J. H. Newman (q. v.), and R. H. Froude, Fellows of Oriel; the Rev. E. B. Pusey (q. v.), Regius Professor of Hebrew, and Canon of Christ Church; Rev. Isaac Williams, Fellow of Trinity, author of the *Cathedral and other Poems;* Rev. Hugh Rose of Cambridge; and others. The *Tracts* were issued anonymously, and, together with articles in the *British Critic* by the same writers, produced a great effect, especially among the clergy. Protestant principles were openly discountenanced, and tenets

closely resembling those of the Church of Rome were boldly put forward. The doctrines of Apostolical Succession, Priestly Absolution, Baptismal Regeneration, the Real Presence, the Authority of the Church, and the value of Tradition, which had long lain hid in the language of the Prayer-book, were widely revived and taught, and caused much alarm in some quarters; though it must be admitted that those principles had always been held by a portion of the English clergy, and claimed to be only a fair exponent of the teaching of the church. The study of the Fathers and old divines, of church history and ancient liturgies, was greatly revived in the universities and among the clergy, and a host of publications inculcating with more or less extravagance the same views issued from the press.

The movement proceeded, notwithstanding the general opposition of the authorities, till it culminated in the publication, by the Rev. J. H. Newman, of the Tract No. 90, which was designed to show that much Roman doctrine might be held consistently with subscription to the Thirty-nine Articles. This being held to favor a 'non-natural' interpretation, was received with general condemnation, and led to the termination of the series, to the resignation by Mr. Newman of the vicarage of St. Mary's, Oxford, and subsequently to his secession, in 1845, to the church of Rome. In this step he was followed by many of his friends and associates, though the other leaders of the movement have continued in the English Church. With Mr. Newman's secession, the Tractarian movement terminated; but its effect remains in several visible results. 1. The first of these may be said to be the revival and strengthening of the High Church party, which still maintains to a great extent the principles advocated in the *Tracts;* and though checked by some judicial decisions, such as the Gorham (q. v.) judgment, in the endeavor to acquire exclusive power, has gained great and perhaps increasing influence in the church. 2. Side by side with the revival of Catholic doctrines, there has been a great development of ritual. The Tractarian movement was early marked by the introduction of various alterations in the mode of performing divine service, such as the use of the surplice instead of the gown, intoning the prayers and singing the responses, the elevation of the communion table into an altar, the substitution of low open benches for high pews—all of which, though claiming to be a restoration of ancient usage, having the authority of the law, were regarded with alarm as approximating to the Church of Rome (see RITUALISM). 3. Another effect of the Tractarian movement was the remarkable impulse given to the building and restoration of churches, and the revival of Gothic architecture, which has been manifested in all parts of England, and given a character to the ecclesiastical buildings of the present century which will mark them for ages to come. 4. The Tractarian movement has undoubtedly been the cause of the secession of many English clergy and laity, some of them men of considerable ability and distinction, to the Church of Rome, which has greatly increased the strength and influence of that communion in the country, and caused great scandal to Protestants. Lastly, the movement may, however, be admitted to have produced a great increase of learning, piety, and devotedness among the clergy, and the establishment of colleges, sisterhoods, and other religious and charitable institutions.

TRACTION ENGINES. See STEAM-CARRIAGE.

TRADE, BOARD OF, a department of government more correctly designed 'The Lords of the Committee of Her Majesty's Privy Council appointed for the Consideration of all Matters relating to Trade and Foreign Plantations.' In 1660, Charles II. created two separate councils for Trade and for Foreign Plantations, which, in 1672, were consolidated into one. The Board of Trade and Plantations, after being abolished in 1675, reappointed in 1695, and after modifications, was again abolished in 1782. In 1786, the presently existing department was established by Order in Council, being a permanent committee of Privy-council for the consideration of all matters relating to Trade and the Colonies. The Board consists of a president, together with the Lord Chancellor, the Archbishop of Canterbury, the First Lord of the Treasury, the principal Secretaries of State, the Chancellor of the Exchequer, the Speaker of the House of Commons, and others. But of the latter *ex officio* members, none take part in the work of the board, which is managed by the president and his staff; the staff includes the permanent and parliamentary secretaries, four assistant secretaries, and a chief of the statistical department; the board is now divided into five departments: (1) the statistical and commercial department, (2) the railway department (3) the marine department, (4) the harbor department, and (5) a financial department. Since 1864, the presidentship has always been held by a Cabinet Minister. Before 1867 there was a vice-president, who was a member of the administration, though without a seat in the cabinet.

The functions of the Board of Trade are partly of a ministerial, partly of a judicial kind, and have of late years been greatly enlarged by a variety of statutes. The Board is charged with the general superintendence of all matters relating to the mercantile marine. It requires and considers reports made to its inspectors and other officers, and orders returns of various kinds regarding trade and navigation. In the exercise of a certain amount of control over marine boards, it is empowered to make regulations regarding the examination and qualifications of applicants for the position of master or mate of passenger-ships. Under 17 and 18 Vict. c. 104, it grants licenses to persons to engage or supply seamen or apprentices for merchant-ships, decides on claims for wages, and investigates charges of misconduct and incompetency. In virtue of 14 and 15 Vict. c. 79, it appoints officers to inquire into and report on the condition of steam-vessels.

The supervision of railways and railway companies, both as to their original formation and their working, constitutes an important part of the duties of the Board of Trade. Railways were first subjected to government control by 3 and 4 Vict. c. 97, which conferred power on the Board of Trade to appoint inspectors of railways, to approve or disallow by-laws, to require returns of traffic, and to decide disputes between connecting lines. Further powers were added by 5 and 6 Vict. c. 55. In 1846, the increase of these duties, arising from the rapid extension of railways, led to the transfer of this department of the Board of Trade to a separate Board, created exclusively for the management of railway business; but in 1851 this latter Board was abolished, and its powers again transferred, by 14 and 15 Vict. c. 64, to the Board of Trade. Notices of applications for railway acts, with plans, are required to be deposited with the Board before any bill can be introduced into parliament; and before any railway can be opened for traffic, the permission of the Board must be obtained, on the report of an inspector. On the occurrence of an accident, notice must be given to the Board, which sends an inspector to inquire into the circumstances, and, on his report, the Board is empowered to take what steps are judged necessary for the security of the public.

Many matters relating to the interests of trade, which come before other departments, are referred to the Board of Trade for information or advice. Thus there are frequent communications with the Foreign Office regarding the negotiation and working of commercial treaties, and with the Treasury regarding alterations in the customs.

A statistical department of the Board was established in 1832, whose province is to collect and publish tables containing classified information regarding the revenues, population, commerce, wealth, and moral and economical condition of the United Kingdom and its dependencies, to prepare a selection from the statistics of foreign countries, and a monthly account of trade and navigation. All applications made to the Queen in Council by companies or private persons for charters of incorporation, are referred to the Board of Trade; and among the functions committed to it by statute are the registration of joint-stock companies, and of copyright in designs. The Board is empowered by several local and personal acts to control the proceedings of the commissioners for regulating the employment of coal-whippers, and the discharge of coal-laden vessels in the port of London. In 1853, the Department of Science and Art, which owed its origin to suggestions made in the Second Report of the Commissioners for the Exhibition of 1851, and was at first a department of the Committee of the Privy Council on Education, was placed under the control of the Board of Trade; but in February 1856, it was retransferred, by an Order in Council, to the Committee of the Privy Council on Education.

TRADE CORPORATIONS. See CORPORATION, and JOINT-STOCK COMPANY.

TRADE, LIBERTY TO, is one of the rights incident to all persons by the law of England. So absolute is this right, that it is considered by courts of law to be an illegal and void covenant when a person, however deliberately, engages never to trade, for it is against public policy to support it. In the sale of the good-will of a business, such covenants are sometimes resorted to, in order to prevent the party selling a business from setting up immediately afterwards the same business, and so defeating the object of the transaction. Accordingly, in all such cases, the courts have arrived at the following result: If a person engage absolutely not to carry on a particular business anywhere, his engagement is void, and not binding; but it is competent for him to engage not to carry on a particular trade within a certain specified reasonable distance—as 20 or 30 miles—from a certain point, the reasonableness being estimated according to the nature of the trade and locality. If this engagement were not legal, it would be impossible to negotiate the sale of the good-will of a business. Subject to the above restriction, any person may carry on trade in any locality he pleases. But in the case of an alien enemy, a license of the crown is necessary to enable a subject to carry on trade with him. It was also anciently a maxim, now obsolete, that none of the king's subjects could lawfully trade with a nation of infidels without the king's leave, because of the danger of relinquishing Chris-

tianity. Though, at common law, every man is free to carry on what trade he pleases, still there are a great variety of lawful trades which are subjected to certain restrictions, either ostensibly for purposes of revenue, or for the purpose of protecting the public from certain evils attending such trades.

Thus, attorneys, publicans, manufacturers of cotton, &c., chimney-sweepers, and many miscellaneous employments, are subject to various restrictions. Formerly, also, the liberty to trade was considerably impeded by the ancient corporations and guilds; and it was a practice for these guilds to impose certain conditions on all persons who sought to trade in large towns, otherwise they were excluded from certain commercial as well as political privileges. As the by-laws which were the instruments of creating these restrictions were often authorized by charter of the crown, or grew up by ancient use and custom, then in harmony with the spirit of the age, the courts had a difficulty in treating them as illegal. But by the Municipal Corporations Act which passed for England in 1835 (5 and 6 Will. IV. c. 76), these restrictions were abolished. That act recited that, in divers cities, towns, and boroughs, a certain custom had prevailed, and by-laws had been made that no person, not being free of a city, town, or borough, or of certain guilds, mysteries, or trading companies, should keep any shop, or place for putting to show or sale any wares or merchandise for hire, gain, or sale; and it enacted that henceforth, notwithstanding such customs or by-laws, every person in any borough might keep any shop for the sale of all lawful wares and merchandise by wholesale or retail, and use every lawful trade, occupation, mystery, and handicraft, for hire, gain, sale, or otherwise within any borough. The city of London, however, was excepted from that act, and some of these old restrictions still flourish there. The law in Scotland and Ireland was also altered at the same time. The repeal of the Navigation Laws (q. v.) has also removed many restrictions on those who traded with ships.

TRADE-MARKS. The attaching of peculiar marks, by which manufacturers seek to distinguish their own productions from those made by other persons, is an important privilege, both as concerns the producer and the consumer; because no honest manufacturer will invent and apply a trade-mark to his wares, unless he is convinced that they possess some special excellence, which he wishes thus to make known; and it is desirable the public should have the benefit of such direction in the choice of their purchases as is thereby afforded. Nevertheless, until 1862, the law in Great Britain was in a very unsatisfactory state upon this subject, and the marks of celebrated manufacturers were pirated with the most reckless audacity both by British and foreign firms, in most cases, to enable them to pass off upon the public articles of very inferior character. For such infringement, the only remedy was to proceed by injunction from the Court of Chancery, a process which was far too troublesome and costly for the class of inventors most likely to be injured. The 'Merchandise Marks Act' of 1862 has remedied this evil, and simplified the whole matter, by making it a misdemeanor to forge or counterfeit any trade-mark, or falsely to apply any such trade-mark, with intent to defraud, whether applied to a cask, bottle, stopper, vessel, case, cover, wrapper, band, reel, ticket, label, or any other thing, in or with which any commodity is sold, or intended to be sold. It is henceforth an offence to sell or expose, either for sale or for any purpose of trade or manufacture, articles with forged or false trade-marks, under a penalty of a sum equal to the value of such articles, and a sum besides not exceeding £5, or less than 10*s*. Every addition to, or alteration and imitation of, any trade-mark made with intent to defraud—the intent being the essence of the offence in all cases—is to be deemed a forgery, and punished as such. It is further made obligatory on every person who shall sell an article having a false trade-mark to give information as to where he procured it, on a demand for such information being made to him in writing. In 1875, an Act was passed to establish a register of T.-M., and amended in 1876; to the effect that, after 1st July 1877, no steps can be taken to prevent infringement unless the trade-mark has been entered in the register established under the superintendence of the Commissioners of Patents.

To mark any false indication of quantity is also punishable with penalties. A conviction under the act is not to affect the civil remedy at law, nor need any indictment specify who is intended to be defrauded by the fraudulent use of spurious marks. The punishment for the misdemeanor may, at the discretion of the court, either be by fine or by imprisonment, with or without hard labor; and in the event of fines not being paid, the offender may be imprisoned until they are. The vendor of an article with a trade-mark is to be deemed to warrant or contract with the purchaser that the mark is genuine, unless otherwise vouched for in writing. A similar obligation rests upon those who sell articles marked with specific quantities. In suits against persons using forged trade-marks, the court may not only order the destruction of the articles fraudulently marked, but may by injunction prevent a repetition of the offence. The time during which proceedings may be taken is limited to three years. See *Trade-marks*, by Hardington (1881).

TRADE PROTECTION SOCIETIES are associations composed of merchants, tradesmen, and others, which have been formed for the promotion of trade, and for protecting the individual members from losses in their business transactions with each other, and with the community at large. They began to spring up about the middle of the last century—one of the first started in this country being the 'London Association of Guardians for the Protection of Trade,' which was established in 1776. In 1871, the Board of Trade granted a license for incorporation to one under the Companies Acts, 1862—1867. The operations of these societies used to be confined chiefly to the compilation of registers of bankruptcies, insolvencies, and private settlements with creditors. The registers were formed thus: Each member informed the secretary of his society of the name, occupation, and address of the customers who became insolvent, with the amount of dividend their estate yielded; and latterly, the circumstances connected with such insolvency, whether recklessness or extravagance on the part of the bankrupt, or innocent misfortune. These circumstances were carefully recorded, and the information thus collected having been found useful, means were taken to render the registers more complete. With this view, new sections were added to the registers, and special attention was directed to the exposure of swindlers, and persons who had been guilty of fraud or embezzlement.

The information accumulated in the registers, though always accessible to such members as made inquiry at the offices of the society, was kept strictly private from all others. But the extraordinary development of commercial enterprise which took place in the early part of this century, added a new stimulus to the trade protection movement. The registers which the societies now printed and circulated among their members contained transcriptions from the following public records; viz., the records of the bankruptcy courts, registers of assignments and trust-deeds, bonds or warrants of attorney, bills of sale, judges' orders, protested bills, and decrees in absence. In addition to the diffusion of information of this description, the societies undertook to recover past-due bills and accounts for their members, to investigate the circumstances connected with bankruptcies and insolvencies, collect dividends, and perform the general agency business of their members—the whole being done under the direction of a committee appointed for this purpose. Committees were also appointed to scrutinize all measures affecting trade and commerce which might be introduced into parliament, and to promote legislation favorable to the commercial interest. The sphere of action of trade protection societies thus rapidly widened, and their utility kept pace with their growth. The older societies established offices and branches throughout the country; and new societies sprang up in the large provincial cities, which in their turn opened agencies and branches in other towns and villages; and the various societies being in communication, the machinery of the whole is available for the purposes of each.

TRADES' UNIONS, in their character of benefit and sick societies, do not fall within the range of this article. We have principally to consider them as associations of workmen against employers, for the purpose of gaining, either in time or money, a larger share of the profits of their trade. A brief historical sketch of the growth of the principle of combination may fitly introduce the subject.

In one form or other, combination has always existed, ever since the employed and employing classes became distinguishable from each other. For a long time after the Conquest, the inhabitants of England were of two classes, freemen and slaves. These relations not permitting work for wages, there could be then no combination in the modern sense. About the middle of the 13th c., we find that wages had begun to be paid, so that for 600 years there have been laborers receiving a money price for their services, competing for employment, and arranging terms with employers. The power of legislation was, however, with men who believed their interests antagonistic to those of the workmen, and its complexion was always favorable to masters. When, after the great pestilence of 1349, the reduced number of laborers demanded better pay, it was enacted that carters, ploughmen, and agricultural servants generally should be content with their previous rate of liveries and wages; they were to continue to be paid in kind where payment in kind had been customary; they were forbidden to hire themselves for the day, but must take service for a year or other fixed period; a rate of wages was fixed for weeders, haymakers, mowers, and reapers; and their hiring for the future was to be in public. A little later, in1363, the diet and clothing of artificers and servants were fixed by act of parliament, and clothiers were required to make, and tradesmen to sell, cloth of a regulated quality at a regulated price. The rate at which labor should be purchased was fixed after this fashion for almost two centuries, and the practice declined solely because of the impossibility of preserving it. But even within the last 150 years, a relic

of the old superstition revived, so characteristic as to be worth notice.

A tariff of wages, drawn up in 1725 by the Manchester justices, declares that any workman conspiring to obtain more than the rate thereby fixed, should for the third offence stand in the pillory, and lose an ear. Economical error, it will be seen, is by no means the monopoly of the poor.

One of the earliest forms assumed by combination is shown by the statutes, passed about 1400 A.D., which excluded from city labor all who had been trained to the plough up to the age of 12 years. The evasion of these acts was the subject of bitter complaints from the city inhabitants, whose practical union against agriculturists was defeated by the sending of country children into towns as apprentices before they reached that age. For generations, this jealousy of corporation against corporation, continued with more or less intensity.

In the more ancient forms of associated labor, such as guilds and chartered companies, combinations such as those which now prevail could not exist. There were no masters and workmen as separate and opposed classes. Producers were united as against the community, and they had no reason, so long as the guild was prosperous, for internal dissension. When, by the abuse of their power in prosperity, they incurred hostile legislation, they became disintegrated; workmen were employed who had never been apprentices; and ultimately the owners of capital and the owners of labor became distinct and often opposing camps. Instead of a guild or trade being any longer a compact monopolist body, acting for itself against the community, the tendency was thenceforward for combination of one section against the other.

Trades' unions, organized for purposes such as those which contemporary unions contend for, have existed for more than three centuries. So early as 1548, a statute of Edward VI. is directed, amongst other culprits, against certain 'artificers, handicraftsmen, and laborers,' who had 'sworn mutual oaths' to do only certain kinds of work, to regulate how much work should be done in a day, and what hours and times they should work. The usual penalties of fines, pillory, and loss of ears were to follow a breach of its enactments. Add the regulation of wages to the objects enumerated in this statute, and we have in effect the trades' unions of the present day. Many fruitless acts were afterwards passed to prevent combinations for raising wages. So long as a tacit bond existed, and unquestionably one did and does exist, amongst employers, reprisals on the part of workmen were certain, and the only question was, whether the right of combination should be recognized by the law, or whether the parties who had recourse to it should be driven into secrecy and illegality. But it was not till 1824 that the legislature had sufficient wisdom to repeal the numerous and vexatious acts of parliament by which it had been sought to prevent the union either of masters or workmen. By the celebrated act of that year, the combination of either workmen or capitalists was legalized, so long as the unions refrained from violent interference with persons who might refuse to join them. This act was supplemented by another, passed in 1825, which in effect declared legal all combinations to settle rates of wages or hours of work, and illegal all such as aimed at other methods of controlling employers in the use of capital, or in processes of manufacture. The latest legislation (see COMBINATION) goes further still, declaring combinations legal even when acting (peaceably) in restraint of trade.

A modern trades' union is a rather complex organization. Perhaps the best definition of them is the one given by the Social Science 'Committee on Trade Societies,' appointed at Bradford in 1859, and which published its Report in 1860. The committee included Dr. Farr, Professor Fawcett, Mr. W. E. Forster, and many other well-known names, and its investigations were very searching and valuable. Indeed, its Report is even yet by far the best repertory of facts on the subject. A trade society is therein defined as 'a combination of workmen to enable each to secure the conditions most favorable for labor.' The capitalists accumulations afford him an advantage which the laborer, without association, does not possess. The funds of the union are intended to supply this deficiency. As accessories, the unions collect funds for other purposes, such as benefit societies, insurance of tools, libraries, and reading-rooms; but their trade objects are those with which we are especially concerned. The following means of assisting and defending the trades associated are enumerated by the committee as now in general use—1. Publishing periodically the state of the trade in different parts of the country; 2. Keeping registers of men unemployed and of masters wanting men; 3. Assisting men from town to town in search of employment, and occasionally to emigrate; 4. Regulating the number of apprentices in the trade; 5. Maintaining men in resistance to employers; 6. Regulating number of working-hours, and preparing trade rules; 7. Organizing strikes.

The advocates of the unions insist that they are the only means by which workmen can defend themselves against the aggression of employers. It is argued that the individual laborer has no chance of resisting the capitalist on equal terms; that starvation treads too closely on his heels to permit his successfully opposing a reduction of his wages, however arbitrary or unjust. It is urged that associations of employers are practically universal, and that their object is mainly to secure for themselves the largest possible share of the profits which are the product of capital and labor united. It is further said, that in the event of any depression of trade, the masters invariably attempt to reduce wages; and that when trade improves, they defer as long as possible the restoration of the former rate. Thus, workmen are the first to feel commercial disaster, and the last to benefit by better times. Any attempt to remedy this state of things by individual action would, it is conceived, be abortive.

The capitalist might easily do without the services of any single laborer, while to the latter the loss of employment might be ruin. Association on the part of the employed class becomes, therefore, a necessity, and their organization puts them at once much more nearly on an equality with employers when negotiating either as to rates of wages or terms of labor. That in both these matters there is a constant gravitation against the workman seems to be admitted by most who have considered the subject, and there is difficulty in suggesting any effective resistance to the downward tendency, except that of combination. Unionists point to many regulations in the interests of workmen which combination has enabled them to introduce, and while they freely admit that in numerous instances the contest between labor and capital has resulted in the apparent defeat of the former, yet they assert that, in the long run, most of the points contended for have been gained. They maintain that, in very many trades, they have succeeded in preventing abuses, and that the unions have contributed, more than any other agency, to make 'the workman's life regular, even, and safe.' Further, it is contended that the necessity for strikes will become continually less as organization becomes more perfect and uniform; the just limits of their action will be more fully comprehended; the sufferings and losses of past strikes will act as a warning against too precipitate action in the future, either on the part of masters or men; and that, in the end, the main results of combination will be secured, without the necessity of having recourse to the arbitrament of force, either in the shape of strikes or lock-outs—the latter of which, indeed, is only a strike of the employers against the employed.

Yet it cannot be concealed that against this catalogue of uses may be set many and serious evils. Some unions dislike the exertion of special or superior ability by any of their members, deeming it an injustice to the rest that one should gain higher pay or win a loftier position. In many cases, as a matter of deliberate policy, they set themselves against and discountenance any elevation of the standard of labor, and so act as an effectual bar to the industrial progress of their class. In other instances, strikes are determined upon by unions at times when the position of the market renders success impossible, resulting in severe and prolonged suffering; while in some 'highly skilled and limited trades,' a far higher rate of wages has been enforced for a time than the value of the labor performed would justify, in the end materially checking production, or transferring the industry itself to other countries. The same effect has been produced by the arbitrary enforcement, in some branches of manufacture, of obnoxious restrictions upon the hours and mode of working. Thus, Birmingham lost much of that portion of its hardware manufacture which is now carried on by machinery, in consequence of the resistance offered by the Birmingham artisans to the introduction of machine-labor; and the steel manufacture threatened at one time to migrate from Sheffield, on account of trades' union dictation. There is, moreover, another and serious class of objections. There can be no doubt that unions foster an unfortunate spirit of antagonism. Being constantly and consciously on the defensive, they come at last to suspect evil in every movement, and to put a sinister interpretation on every action of employers.

The special interests of the trade affected are too often the only objects cared for; and narrow, selfish, and unjust regulations are enacted for its supposed benefit. One trade is isolated from another; one class of laborers fences itself off against incursions upon its peculiar territory, and tries, by the limitation of the number of apprentices, the enforcement of objectionable terms of service, and other coercive methods, to remain a close monopolist corporation. It is needless to point out how injuriously such a policy affects the working-classes generally, and what a complete subordination it implies of the general well-being to the desired prosperity of a small and selfish number. In some trades, the practice of coercion has grown into systematic terrorism and crime. The Sheffield grinders and the Lancashire brickmakers began with merely refusing to work with non-unionists; but their methods of procedure have ended in frequent brutal and murderous outrage. The revelations of the special commissions of 1867 are among the saddest contributions to English history.

One of these special commissions—that of Mr. Overend and his colleagues at Sheffield—is of sufficient importance and interest

to warrant rather special reference. Out of about sixty trades' unions in that town, thirteen are proved to have promoted or encouraged outrages of various degrees of criminality, from theft and intimidation up to personal violence and murder. The most ordinary method of coercion in use bears the name of 'rattening,' and it is employed to enforce payment of contributions to the unions, and to compel obedience to their rules. If any workman fall into arrear with his payments, or infringe the rules of the trade to which he belongs, his wheelbands, tools, or other materials of work are secretly removed and held in pledge, until he submits to the requirements of the union. This is done most frequently under the direct orders of the union officers; but sometimes a private member 'rattens' another, who is known to be in some way at issue with his society, and takes the risk of his action being adopted by the remainder.

In the majority of cases, on due submission and a moderate payment, the property rattened is restored to its owner. The practice is defended on the ground that it is the readiest and most effectual means of compelling the regular payment of contributions to the union funds, and of enforcing obedience to union orders. So thoroughly is it understood that rattening is the work of a trade society, that a man whose tools are taken never thinks of applying to the police for restitution; he communicates with the secretary of the union which governs his trade. In cases of contumacy on the part of a member, it is sometimes attempted to saddle his employer with the cost of the rattening, even when he is no party to the dispute, on the ground, that he ought to compel his workmen to comply with the rules of the union. Rattening is generally successful in securing its ends; but if it fail, an anonymous letter is sent to the refractory person, threatening vengeance in the event of further resistance; and in only too many instances, the threats have been carried out to the last extremity. Thus, in 1854, a man named Elisha Parker had his house blown up by gunpowder, his horse was hamstrung, and he himself disabled by a pistol-shot, because he worked with non-union men, after being warned to leave his employment. In 1857, James Linley was shot at and wounded for changing his business of grinding scissors for that of grinding saws, and keeping a greater number of apprentices than the rules of the trade prescribed. As he still persisted, he was shot to death with an air-gun in 1859. At other times, powder has been mixed with filings or other materials near the working apparatus of obnoxious persons, who have often suffered serious injuries from its explosion. The list of outrages, fatal and other, might be largely extended; but those we have given are not unfair representatives of the whole. It is only fair to add that of late years the evil pre-eminence of Sheffield has not been so obvious, but the old spirit occasionally asserts itself still, though happily in somewhat milder forms.

The bellows-cutting by the chainmakers of the midland districts, during their strike of 1859, is somewhat analagous to the rattening at Sheffield; and disclosures of similar practices were made at the inquiry before Mr. Pickering and others in Manchester, also, in 1867. We have not space to go into detail; but the examples of Sheffield, Dudley, and Wolverhampton were faithfully repeated. Powder explosions, personal injuries, the wholesale destruction of bricks by trampling upon them while soft, a shed destroyed by naphtha, the insertion of needles into the clay, so as to disable the workmen; such were among the characteristic confessions made by the witnesses. Among other reasons given for a strike was one that an employer had himself 'set a brick,' a task expressly reserved for brick-setters; and among the restrictions on trade was one forbidding the use in Manchester of bricks not made within the Manchester district, a circle about eight miles across.

Although in very many instances strikes have been begun and concluded without the intervention of trades' unions, yet, as a matter of fact, all the more notable strikes have either been organized by them, or had their direct support; and of late, the tendency has been to associate the unions of different trades into one body, so far as this particular policy is concerned. This article would therefore be incomplete without a brief reference to some of the more remarkable contests between masters and workmen.

Among the leading strikes, few, if any, have occupied the attention of the public more than the struggle between the Amalgamated Society of Engineers and their employers, which took place in 1851—1852. It originated in the determination of the workmen to abolish piecework and overtime. The dispute was further complicated through a demand made by the mechanics at Messrs. Hibbert & Platt's works, in Oldham, insisting that certain self-acting machines in use there should be attended to by skilled laborers only. Thirty-four Lancashire firms entered into a written agreement to meet any action on the part of the men by the immediate closing of their establishments, which furnished employment to 10,000 people. A similar resolution was adopted by the master engineers of the London district. The men left work on the 1st of January 1852, and the works were formally closed on the 10th. The strike virtually ended on the 30th March, when the men conceded the points in dispute, with the exception of an obnoxious declaration insisted upon by the masters, that none of the men employed should, for the future, either directly or indirectly support trades' unions. The cost of the strike is understood, besides the enormous loss of wages, to have exceeded £40,000, including moneys contributed to non-society men. Great numbers of the men emigrated, and fearful suffering was endured by thousands of families. The Amalgamated Society still exists, and is one of the most extensive and powerful organizations in the interest of labor in the world. In 1852, after its failure in the great struggle, it started with 7000 members. In 1860, its members exceeded 17,000, and in 1881 they numbered 46,101. The total income of the society for 1881 was £124,109, and its accumulated funds were £145,957. It has branches in every part of the world where English engineers are employed.

The strike of 1853 in the cotton trade at Preston was also met by a lock-out. About 18,000 people were thrown out of work. The struggle lasted seven months, and during its progress public feeling was keenly roused. The 10 per cent. advance in wages contended for was successfully resisted by the masters, the last chances of the work-people being destroyed by the depression of trade consequent upon the outbreak of the Russian war. The cost of the strike to the workmen and their friends, in actual money paid, was £105,000.

In 1859, there occurred a strike and lock-out in the building trades of London. The object of the strike was to reduce the working day from ten to nine hours, the existing rate of wages being retained. It was met by the simultaneous closing of 225 building establishments, at which 24,000 men were employed. The contest lasted for nearly seven months, and ended in the surrender of the men, after an enormous loss in wages and trade funds. No less than £23,000 was contributed by other trade societies, in aid of the men concerned in this dispute.

The mining trades—coal and iron—have within the last few years shown marked triumphs of labor over capital. The great Forest of Dean and South Wales strikes in the coal-trade terminated at the beginning of 1873, substantially in favor of the employed. Yet there are some later facts which tell the other way. A determined strike of the Edinburgh book-printers (1872—1873), for the 51 hours limit, which lasted 13 weeks, terminated in favor of the employers. Notwithstanding the absolute necessity which exists for coal in a climate and a manufacturing country like ours, and the close unions maintained by the working colliers, the coal-masters have succeeded in maintaining the upper hand, and wages are sinking back towards the old level, though now they will probably always remain at a somewhat higher point than they had reached up to 1872. The failure of the farm-laborers in 1873—1874 to carry their struggle to a successful issue, even under the singularly able leadership of Mr. Joseph Arch, and notwithstanding the fact that large numbers were assisted to emigrate, so reducing the competition for employment upon which the farmers relied for victory, is another proof that triumph is not always with the men. It is only right to add that the men could scarcely be expected to succeed in their first organized attempt against a system centuries old.

Only a small proportion of existing trades' unions have registered themselves in accordance with the Act 34 and 35 Vict., cap. 31; yet the report of the Registrar of Trades' Unions showed in 1881, 179 registered trades' unions, with 200,370 members, an income of £228,211, and a fund of £258,663.

The nine-hours movement created great excitement for a time, but was practically settled in favor of the labor-classes. The first strike for it was by the Edinburgh masons in 1861. After an exhaustive struggle, the masters yielded the men's demand for a limit of 51 hours a week. Agitation was kept up by different trades in succession; and ultimately the hours of labor were generally so fixed. But in 1878 a disposition to insist on 54 hours was manifested by employers in various quarters.

The lowering of the franchise to household suffrage has lent a new significancy to trades' unions. They have now become a great power in politics. There is the Trades' Congress, which holds an annual conference in the different leading towns, and discusses questions affecting the interests of labor. They have not yet begun to publish transactions; but, no doubt, they soon will, for this congress is undoubtedly to be one of the controlling social powers of Great Britain. It appoints a committee every year, which sits in London, to look after the acts of parliament and other public movements affecting trade. Another object they contemplate is to get working-men returned as members of parliament; and this they have at last accomplished by the election to the parliament of 1874 of Mr. Alexander Macdonald for Stafford, and Mr. Thomas Burt for Morpeth.—Mill's *Political Economy; Report of the Social Science Committee on Trades' Societies*, 1860. For recent legislation on the subject of trades' unions, see the article COMBINATION.

TRADE-WINDS. See WINDS.

TRADI'TION. See RULE OF FAITH; INFALLIBILITY.

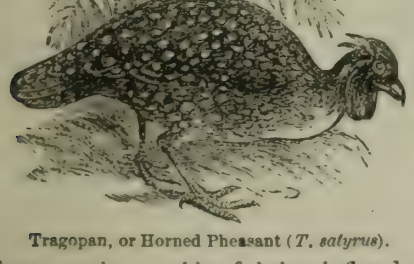
TRADU'CIANISM (Lat. *traducianismus;* from *tradux*, a 'vine-layer' for propagation), one of the theories adopted for the purpose of explaining the production of the soul in the procreation of the human species. The theory known as traducianism is ascribed to Tertullian as its first author; and is elaborately explained and defended by him in his book *On the Soul*, written after he had lapsed into the Montanist heresy. In opposition to others who had held the theory of the pre-existence of souls, of which pre-existing souls one is divinely infused, or, by some natural affinity, is attracted into each fœtus as soon as it has been formed by generation in the procreation of man, Tertullian taught that souls are propagated by souls as bodies by bodies, and by the same or a simultaneous process. In another place he describes this origin of soul from soul as generation, and even of a class analogous to corporeal generation; and this more gross and material exposition of the theory of traducianism is sometimes called *Generationism;* which, however, is commonly looked upon as a totally distinct theory. A third hypothesis as to the origin of the soul suggested that, in the propagation of the human species, whenever a human body is formed by generation, the soul which is to animate that body is created, and by divine power infused into it. This theory is called *Creationism*. The discussion of these theories in the 4th and 5th centuries was much promoted by the controversies on Manichæism. See MANICHÆANS.

TRAFA'LGAR, CAPE, a low promontory on the south coast of Spain, about 29 miles west-north-west of Tarifa (q. v.), on the Straits of Gibraltar. It is memorable for the great naval victory obtained (Oct. 21, 1805) by the British fleet under Nelson, over the combined fleets of France and Spain, under the French commander Villeneuve and two Spanish admirals. The British force consisted of 27 sail of the line, 4 frigates, 1 schooner, and 1 cutter; the force of the French and Spaniards united amounted to 33 sail of the line, 5 frigates, and 2 brigs. It may be remarked that the largest of the enemies' ships carried 30 guns more than the largest of the British ships. The engagement resulted in a splendid victory for the British, who captured nineteen of the enemies' ships. The victory, however, was gained at the cost of the life of the greatest of English admirals. See NELSON.

TRA'GACANTH. See GUM.

TRA'GEDY. See DRAMA.

TRA'GOPAN, a genus of birds of the family *Phasianidæ*, having the head crested, but naked on the cheeks and around the eyes; a horn-like caruncle projecting backwards from behind each



Tragopan, or Horned Pheasant (*T. satyrus*).

eye; and a loose wattle, capable of being inflated, hanging beneath the bill. The tarsi are armed with a blunt spur in the male, unarmed in the female. The species are few, and are natives of Asia. They are birds of beautiful plumage, somewhat resembling pheasants, but of more bulky form, and with rounded tails of moderate length. The first-known species (*T. satyrus*) has been called the *Horned Pheasant*. It inhabits the higher parts of the Himalaya, Tibet, and some of the mountainous provinces of China. The tragopans seem particularly deserving of attention, as capable of acclimatization in Britain, and probably of domestication.

TRAIN-BANDS (or, more properly, TRAINED BANDS), a force of militia, and not differing essentially from that force, substituted by James I. for the old English Fyrd, or national militia. The train-bands of London were chiefly composed of apprentices; and their unruly doings formed the subject for many facetious plays and tales. In the civil wars, the train-bands sided with the Parliament; and Charles II. restored the militia on its old local footing.

TRAINING, applied in a Sporting sense, implies the acquisition of the most vigorous and perfect health, and is used alike in reference to men, horses, and dogs. An individual is said to be trained 'in condition,' when he has by certain processes rendered his frame as fit as it is possible for it to be, for performing some feat of strength or endurance—such as undergoing a pugilistic encounter, a wrestling match, or a trial of speed, or any other prolonged exertion. To accomplish this end, a long course of training is often gone through, in many instances of a very severe nature. It being necessary to divest the muscles of every particle of fatty tissue which can possibly be got off without direct injury to the health, it often happens that many pounds of flesh are required to be dispersed, and the most severe and continued exertion, the body being wrapped in thick suits of flannels, denominated 'sweaters,' is necessary. Constant hard and sharp exercise in this fashion, combined with rigid abstinence, and a strict regard to other established laws of the art, are a *sine quâ non* in getting the body into the height of condition. For example, however thirsty the person training may be, after perhaps ten miles' rapid walking in a triple suit of sweaters, he must drink but very sparingly, for although he may have taken off pounds of flesh by profuse perspiration, one glass of ale would undo the whole effect. Great attention to diet is necessary. Indeed, much of the system may, as a modern writer has aptly expressed it, be laid down in the resolute performance of the three cardinal virtues—temperance, soberness, and chastity. Almost the same course is pursued towards animals; and whether for hunting or racing, horses and dogs have to submit to a course of training to bring them into condition.

Lately, the Turkish bath, as a means of procuring the necessary reduction of flesh without such excessive labor, has been found a most efficient ally in training. Out of condition, the muscles are flabby, confused, and coated with fat; the skin dead and lifeless; the eye dull and heavy; the lungs laboring, and the movements slow. In condition, the muscles stand out hard, clear, and defined; the tendons show like cords; the skin is clear and ruddy; the eye bright; the lungs play with unrestrained freedom; and the whole frame is endued with vigor and perfect activity. See Maclaren's *Training in Theory and Practice*.

TRAINING COLLEGES. See NORMAL SCHOOLS.

TRA'JAN'S COLUMN, a celebrated column at Rome, which was reared, 114 A.D., by the Roman senate and people, in honor of the Emperor Trajan. It is considered not only the greatest work of its architect, Apollodorus, but one of the noblest structures of its kind ever erected. The pedestal is covered with bas-reliefs of warlike instruments, shields, and helmets; and a very remarkable series of bas-reliefs, forming a spiral round the shaft, exhibits a continuous history of the military achievements of Trajan. These are in excellent preservation, and, independently of their beauty as works of art, they are invaluable as records of ancient costume. A spiral staircase in the interior of the column leads to its summit. The height of the entire column is 132 feet. It still stands erect in all its ancient beauty amid the ruins of Trajan's forum. The summit was originally crowned by a colossal statue of the emperor, which has been incongruously replaced by one of St. Peter.

TRAJAN'S WALL, a line of fortifications stretching across the Dobrudscha from Czernavoda, where the Danube bends northwards to a point of the Black Sea coast near Kustendji. It consists of a double, and in some places a triple line of ramparts of earth, from 8¼ to 11 feet in height on the average (though occasionally it attains an altitude of 19½ feet), bounded along its north side by a valley, which, being generally marshy, and abounding in small lakes and pools, serves admirably the purpose of a fosse. This valley was long erroneously supposed to have been at one time the channel by which the Danube emptied itself; and a scheme for utilizing it by the construction of a canal to provide a more commodious water-communication with the Black Sea, in lieu of the long and troublesome navigation by the Sulina mouth, has been frequently mooted, and is undoubtedly quite practicable; but the cost of the undertaking has hitherto been a bar to its execution. During the war of 1854, Trajan's Wall became an important line of defence on the invasion of the Dobrudscha by the Russians, and the invaders were twice defeated in their attempts to pass it—at Kostelli (10th April) and Czernavoda (20—22d April).

TRAJA'NUS, MARCUS ULPIUS, Roman emperor, was born at Italica (Alcala), near Seville, 18th September 52 A.D. He was descended from a family which was probably of Roman origin, and was early trained to arms, becoming a prominently successful leader in the Parthian and German campaigns, during the reigns of Titus and Domitian. He was rewarded for his valuable services by promotion to the offices of prætor and consul (91 A.D.), and was ultimately adopted (97 A.D.) by Nerva (q. v.) as his colleague and successor. T. became sole ruler in January of the following year, and celebrated the event of his accession by the usual largess to the soldiers, which gift his liberality prompted him to extend also to the Roman citizens and their children; and he made large provision out of the imperial treasury for the upbringing of the children of poor freemen in Rome and other Italian towns, with the view of encouraging the increase of the population.

In 101 A.D., Rome, for the first time, beheld its emperor leading forth his legions in person on a career of conquest, when T. set

out on his first campaign against the Dacians who had exacted tribute from Rome since Domitian's time. The struggle was long and destructive; the emperor's opponents were valiant warriors, and headed by an able leader, their monarch, Decebalus; but the Romans at last gained a decisive superiority; and in a subsequent campaign (104—105) completely subdued their opponents, whose country thenceforth became the Roman province of Dacia, and was secured by partial colonization. This conquest, the first since the death of Augustus, was celebrated, on T.'s return to Rome, by a triumph, and by games on a most extensive scale, which continued for four months. Thirst for dominion again impelled T. to the east in 106 A.D. Landing in Syria, he marched northwards, received on his way the submission of numerous princes, possessed himself of Armenia, which he made a province of his empire, and hugely gratified the Roman senate with long lists of monarchs, never before heard of, who had bowed to their sway. The record of the events of the next seven years of T.'s reign is extremely defective, the few notices in Dion Cassius and others being insufficient for the construction of a consecutive narrative. In 115 A.D., he again set out from Syria, directing his march this time against the degenerate Parthian Empire; took Ctesiphon almost without a struggle; and descending the Tigris, and subduing the tribes on both banks, became the first and only Roman general who navigated the Persian Gulf. On his return, he found that, like the bent reed which recovers its position when relieved from pressure, the peoples of Mesopotamia, North Syria, and Arabia required to be again and more thoroughly subdued. This being done, and Parthia again conquered, T., sinking under a combination of dropsy and paralysis, which had long afflicted him, attempted to reach Italy, but was overtaken by death at Selinus, in Cilicia, August 117. Though most of T.'s reign was spent in the gratification of his warlike ambition, the internal administration was far from being neglected; the administration of justice was vigorous and impartial; that of finance was equally acceptable; informers (*delatores*) were severely punished, and peculating governors of provinces rigorously prosecuted.

The improvement and beautifying of Rome—a favorite occupation of the emperors—was carried on: the empire was traversed in all directions by new military routes, canals and bridges were constructed, new towns built, the Via Appia was restored, the Pontine Marshes partially drained, the magnificent 'Forum Trajani' erected, and the harbor of Centum Cellæ (Civita Vecchia) constructed. Even if there were not abundant evidence of the sincere desire of T. to increase the comfort and happiness of his subjects, the customary wish formally uttered on the occasion of an emperor's accession, that he might be 'happier than Augustus, better than Trajan' (*Augusto felicior, Trajano melior*), would of itself suffice for proof. During T.'s reign, a persecution of the Christians, of a mild character, took place; and taking into account that T. almost necessarily shared the general belief that Christianity was a perilous species of fanaticism, his conduct towards them deserves, perhaps, to be entitled moderation.

TRAJE'CTORY, in Mathematics, is any plane curve which cuts at a given angle a series of plane curves of the same species and having a common origin. In Mechanics and Astronomy, it denotes the path described by any body projected into space, and continuously acted upon by constant or varying forces; thus, the trajectory of a body projected obliquely for a little distance above the earth, is approximately a parabola (it would be accurately so, were space void, and the center of gravity of the earth infinitely distant), and the trajectories of the planets are approximately ellipses; the term, however, was long, in astronomy, exclusively applied to the paths of comets.

TRALEE', a seaport and parliamentary borough of Ireland, chief town of the county of Kerry, stands on the river Lee, about a mile from the point at which it enters the sea, 162 miles west-south west from Dublin, with which it is connected by the Great Southern and Western and Killarney Railways. The pop. in 1871 was 9506, of whom 8563 were Roman Catholics, and 746 Episcopalians; in 1881, 9664. The first origin of T. was due to the building of a castle, and the foundation of a Dominican convent by the Geraldine family, in 1213; and somewhat later a considerable House of the order of Templars was established. The borough is under the management of commissioners, who dispose of a revenue amounting to above £2000. It returns one member to the imperial parliament. The town is well built, and possesses many public buildings. A large traffic in grain and agricultural produce is carried on, the annual exports amounting to £200,000, and imports to about £150,000. There is a ship-canal, by which vessels discharge their cargoes close to the town.

TRAM. See SILK.

TRA'MMEL-NET, a kind of net resembling the drift-net used in the Herring-fishery (q. v.), but anchored and buoyed at each end, the back-rope supported by small cork-floats, and the foot-rope kept close to the ground by weights. The length varies from twenty to three hundred yards. A variety of trammel-net, chiefly used in the west of England and in Guernsey, consists of three long nets fastened together at top, bottom, and ends. The two outer nets are each five meshes deep, the meshes ten inches square; the middle net is twice as long and deep as the outer ones, but the excess at the edges is gathered in and united all round with the other nets. The outer nets stand with their meshes square and opposite one another, and a fish, in passing through the first net, meets the second or middle net—which, being slack, yields to the pressure—and is carried through the opposite large mesh of the third net into a loose bag or pocket, from which it cannot escape. This net is much used for taking red mullet, and in some parts of Cornwall is called a *tumbling-net*.

TRAMWAY. See RAILWAYS.

TRANCE, or MORBID SLEEP, differs from natural repose in duration; in profound insensibility to external impressions; in following excitement and the exaltation of certain instincts, chiefly the religious and amative, rather than fatigue and exhaustion; and in being the concomitant or symptom of diseases of the nervous system. The attitude, aspect, lowered respiration, and circulation of the entranced, resemble those of the sleeper. But there are many exceptions to this observation. A girl who remained dormant for 13 years, although she grew from a child to a woman in that time, was corpse-like in appearance, had locked-jaw, and there was all but a total suspension of the signs of life. But while an individual cannot be roused from this condition by the most powerful stimulants, an electric shock, or even, it is affirmed, by a surgical operation, thought or dream goes on uninterruptedly, and is more continuous and coherent in character than what takes place in ordinary sleep. So connected and real do these visions appear to the ecstatic, that they are generally accepted as true events, revelations, or impressions, received during a brief visit to another world. Trance has occurred epidemically during periods of great religious fervor and superstition; and whole classes of persons are described as having preached while asleep, in the insurrection of the Cevennes. A similar phenomenon was observed in 1865 in those affected by hysteromania at Morzine, in Savoy. The affection has been divided, according to the intensity of the symptoms, into (1) *Death-trance*, where neither the heart nor lungs act; where the temperature of the body falls; where no sustenance is taken, and the inner dream-life is the only vestige of vitality. Engelbrecht, who was subject to trance, wrote a book descriptive of this inner life, during which he believed himself to be transported to supernatural, if not to heavenly regions. (2) *Trance-coma*, where the breathing and action of the heart are feeble, but perceptible; the joints flexible; but where the external senses are not awake, and where the patient cannot be roused. (3) *Trancesleep*, where, except in the insensibility to external stimuli, and in the length of the suspension of volition, little abnormal is noticed. As these states often succeed hysteria, nervous and other diseases, the bodies of the supposed dead are for a time, in certain countries, so placed as to be watched, and in circumstances favorable to resuscitation.—Mayo, *On the Truths contained in Popular Superstitions;* Figuier, *Histoire du Merveilleux.* See also the articles CATALEPSY, HYSTERIA, ANIMAL MAGNETISM, in this work.

TRA'NI, a maritime city of Southern Italy, in the province of Terra di Bari, 25 miles north-west of the town of Bari. Pop. (1881) 21,173. It is surrounded by a wall with towers and moats, and entered by three gates. T. is an archbishop's see, and has a handsome cathedral, convents, a court of appeal, a theater, and a strong castle. The streets are wide, well built, and paved with flagstones. There is a handsome square. A considerable trade in oil, wine, corn, and cotton, which last is also manufactured here, is carried on.

T. comes first into notice when it submitted to the Normans in 1053. It was then the chief town of a vast county, and was an important harbor in the time of the Crusades. Under the kingdom of Italy, it has again begun to prosper, and promises once more to become an emporium of the commerce of the Levant, as it was in the middle ages.

TRANQUEBA'R, a corruption of *Tallangambadi*, a seaport town on the east coast of British India, 155 miles south of the city of Madras. It stands on a small bay, and is backed by a well-wooded and cultivated country; is a healthy station, much cooler than Madras, and has therefore been made a convalescent dépôt. The town is surrounded by walls, with bastions, and is further protected by the fort of Dansborg. The territory of T. embraces 15 sq. m., and produces rice, the cocoa-nut and other palms, the mango, and a variety of fruits. The town itself contains about 25,000 inhabitants. The territory passed finally into the hands of the English—the Danes having been its former possessors—in 1845.

TRANSCAUCA'SIA, the tract of territory belonging to Russia, and extending between the Caucasus (q. v.) on the north, and Turkey in Asia and Persia on the south. The provinces on both

sides of the Caucasus, with the New Armenian districts, constitute Caucasus or Caucasia in the widest sense, and are under one central authority, with 14 minor governments or provinces. But the government is sometimes divided into North Caucasus, Transcaucasia, and Armenia. Transcaucasia comprises eight governments.

TRANSCENDE'NTAL, TRANSCENDENT (*transcendentalis, transcendens*), words employed by various Schoolmen, in particular Duns Scotus, to describe the conceptions that, by their universality, rise above or transcend the ten Aristotelian Categories (see CATEGORIES). Thus, according to Scotus, *Ens*, or Being, because it is predicable of Substance and Accident alike, of God as well as of the World, is raised above these by including or comprehending them; it has the same relation to the sum of the Categories, as the *summum genus* to the various genera within a single category—Relation (*summum genus*) to the classes of Related things (included genera). Further, the predicates assumed by Scotus to belong to *Ens*, or simple existence; viz., the One, the True, the Good—*Unum. Verum. Bonum*—are styled transcendent, because applicable to *Ens* before the *descent* is made to the ten classes of real existence. In later times, since Kant, the word Transcendental has been largely used as equivalent to the philosophical meaning of *à priori*. See COMMON SENSE, INSTINCT.

Between the hitherto convertible terms, Transcendental and Transcendent, Kant himself drew a distinction, of considerable importance in understanding his own system. By the word 'Transcendental,' he designates the various forms, categories, or ideas assumed to be native elements of human thought; implying that, although they are not products of Experience, they are manifested only in experience; such are Space and Time, Causality, &c. The word 'Transcendent,' Kant reserves for those among the transcendental or *à priori* elements that altogether transcend experience. They may seem to be given in experience, but they are not really given. Such are the 'Ideas of the Pure Reason,' God, an Immaterial Soul, &c. Transcendental elements, when legitimately applied to experience, as Causality and Relation, are called Immanent.

TRA'NSEPT, the projecting wings on the north and south sides of a church, forming the smaller arms of the cross, in the ground plan of cruciform churches.

TRA'NSFERENCE, in the Law of Scotland, means the step by which a pending suit is transferred from a person deceased to his representative.

TRANSFU'SION OF BLOOD has been regarded as a recognized and legitimate operation in obstetric surgery since the year 1824, when Dr. Blundell published his well-known work, entitled *Physiological and Pathological Researches*. The operation had, however, been vaguely known to the medical profession for the last four centuries; and there are obscure allusions in the Roman poets, which would seem to indicate that it was practised as early as the Augustan age:

> Ut replesm vacuas juvenili sanguine venas.
>
> *Ovid.*

The earliest authentic case on record is, so far as we know, that of Pope Innocent VIII., who was unsuccessfully operated on in April 1492. 'The vital powers of Innocent VIII. rapidly gave way; he had for some time fallen into a kind of somnolency, which was sometimes so profound that the whole court believed him to be dead. All means to awaken the exhausted vitality had been resorted to in vain, when a Jew doctor proposed to do so by the transfusion, by a new instrument, of the blood of a young person—an experiment which had hitherto only been made on animals. Accordingly, the blood of the decrepit old pontiff was passed into the veins of a youth, whose blood was transferred into those of the old man. The experiment was tried three times, and at the cost of the lives of three boys, probably from air getting into their veins, but without any effect to save that of the pope.'—Villari's *Life of Savonarola*.

Although Libavius, in 1615, accurately describes the operation, there is no evidence that he ever practised it. Passing over various experiments by Wren and Lower (both of Oxford) in the transfusion of blood from one animal to another, we find Denys of Montpellier, in June 1667, injecting the blood of calves into the veins of a young man who had been much weakened, and had become torpid and slightly dropsical, in consequence of repeated bleedings. The first operation restored him to perfect health. Subsequent cases of his gave rise to a most virulent controversy, which ended with the decision, 'that for the future, no transfusion should be made upon the human body but by the approbation of the physicians of the Parisian faculty.' In November of the same year, Lower publicly made a similar experiment, which seems to have been successful; and in the following year, Riva and Manfridi repeated the experiment in Italy. But the operation, although thus fairly started, soon fell into obscurity, doubtless from a want of success, due partly to the blood of calves and sheep, instead of human blood, being used, and partly to hopeless cases of old age and decrepitude being selected for its application.

At the present day, transfusion is an operation which is almost always restricted* to cases of profuse hæmorrhage in connection with labor; and as Dr. Playfair, in his excellent *Handbook of Obstetric Operations* (Lond. 1865), observes: 'The benefits derived from it are probably twofold: 1. The actual restitution of blood which has been lost; and 2. The supply of a sufficient quantity of blood to the heart, to stimulate it to contraction, and thus to enable the circulation to be carried on until fresh blood is formed. Its stimulant action is probably of far the most importance; and if the operation is performed before the vital energies are entirely exhausted, the effect is most marked, and indeed may be said to be almost unfailing.'—Pp. 212, 213. Blundell was in error in believing that the blood of animals of the same species was essential; Dr. Brown-Sequard having since shown that the blood of various animals can be used indiscriminately provided only certain precautions are taken; and the important† discovery has recently been made by Panum, that defibrinated blood is in every respect as well suited for the operation as pure blood.

'The cases suitable for the operation,' says Dr. Playfair, 'are those in which the patient is reduced to an extreme state of exhaustion from hæmorrhage during or after labor or miscarriage. The operation will not come into contemplation until other and simpler means have been tried and failed, and when the symptoms indicate that life is on the verge of extinction.' The value of the operation in suitable cases is proved by statistical evidence. Mr. Soden of Bath has recorded 36 cases, in 29 of which the patients were rescued from an apparently hopeless state; and out of 57 cases recorded by Professor Martins of Berlin, 43 were entirely successful, and 7 temporarily so. Of the various syringes that have been invented for this operation, Dr. Playfair gives the preference to that of Dr. Graily Hewitt. The blood to be injected should be taken from the arm of a strong and healthy man who can spare a sufficient quantity, since a change of persons leads to delay, and should therefore be avoided. Generally speaking, from four to six ounces of blood are sufficient, but more may be required. It would be out of place to enter, in these pages, into details regarding the mode of performing the operation. They are fully described in Dr. Playfair's work.

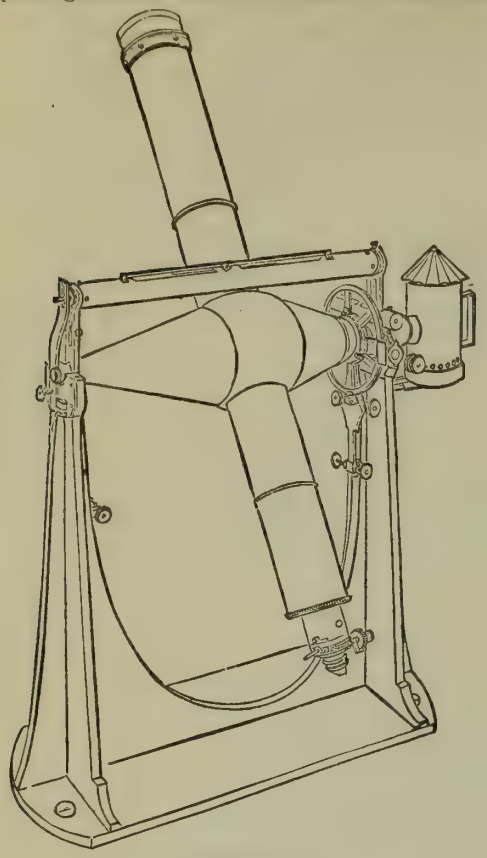
TRA'NSIT-INSTRUMENT, one of the most important of astronomical instruments, consists of a telescope fixed to a horizontal axis, so as to revolve in the plane of the meridian, and is employed, as its name denotes, in the observation of the meridian transits of the heavenly bodies. The axis, which is the most important part of the instrument, and thus demands the utmost care in its construction, consists of a hollow sphere or cube, to opposite sides of which are tightly fastened the bases of two cones in whose apices the pivots are screwed; the sphere or cube is pierced for the admission of the telescope, which is firmly soldered at right angles to the axis. One of the pivots is hollowed so that a stream of light can be directed from a lantern half way along the interior of the axis, and through an aperture in the side, into the telescope tube, where, being received by an annular mirror, set at 45° to the axis and telescope tube, it is directed to the eye-piece, and brilliantly illumines the field of view, while the annular form of the mirror prevents any interference with the passage of rays from the object under observation to the eye. The pivots must be very carefully turned to a perfectly cylindrical form, and fitted into the instrument, so that their axes are accurately in line.

One extremity of the axis carries one and sometimes two small graduated circles, each supplied with index, clamping screws, and vernier; these circles are capable of indicating angular measures to within 1′ or 2′. The pivots rest on massive blocks of stone or other stable material which is little affected by change of temperature, stability being the great mechanical essential of the instrument. This condition satisfied, there are three adjustments necessary before a transit can be observed: the axis must be horizontal; the line of collimation must be at right angles to the axis of motion; and the latter must be placed so as to point accurately east and west. On the perfection of the first two of these adjustments depends whether the telescope sweeps over a great circle of the sphere, and the third is necessary to insure that this great circle shall be the meridian of the place of observation. These adjustments can never be made quite perfect, and the usual mode is to investigate the amount of error in each, and allow for it in the apparent result. To note accurately the instant of time by the astronomical clock at which the object (e. g., a star) is seen to pass the center of the field of view, is the essential part of a tran-

* A case has lately been recorded in which it proved successful in a case of coma from the fumes of carbonic oxide and carbonic acid; and it is not improbable that it may again come into more general medical use.

† Dr Markham has, we believe, suggested the trial of transfusion of blood in cases of the cattle disease. As it would be impossible, without danger, to bring a healthy animal in contact with a diseased one, the value of Panum's discovery, provided the proposed remedy be successful is obvious. The blood of healthy oxen, killed for the market, could be defibrinated by whipping and straining, and would remain fit for injection, when raised to the normal temperature, for many hours.

sit observation. The most effective method is to register the beats of the clock by an apparatus, which, at the end of each oscillation of the pendulum, marks a dot upon a uniformly moving slip of paper. This is effected by the agency of electricity, and is one of its most valuable contributions to astronomical science. At a certain point in each oscillation of the pendulum, it becomes part of a complete galvanic circuit, the contact being immediately



Transit Instrument.

broken by its progression in its oscillation; and it is at these points that the galvanic agency causes the dot to be made.

The instant of a transit's occurrence is similarly noted by the observer, who, by a tap on a break-circuit key fastened to the side of the transit-instrument, causes the graver to make an extra dot; and the distance of this dot from the previous seconds one, compared with the distance between two seconds dots, gives the time accurately almost to $\frac{1}{100}$th of a second. Various ingenious modes of registering have been proposed, all founded on the above principles. It is from the times of transit of the several heavenly bodies thus accurately observed, that their right ascensions are determined.

The transit-instrument was invented by Römer about 1690, and first described in 1700, in the *Miscellania Berolinensia*, vol. iii. One was erected in Greenwich Observatory by Halley in 1721; but it was little used till 1742. The present instrument in that observatory is by Troughton, and was erected in 1816.

TRANSI'TION, a term employed at first by Werner to designate rocks having a mineral character intermediate between the highly crystalline or metamorphic rocks and ordinary sedimentary deposits. As these rocks, in the region where the Wernerian classification originated, had a definite relation to the inferior and superior strata, and contained a uniform series of fossil remains, the term gradually came to have a chronological meaning. It was employed to designate similar deposits wherever they occurred. But a more enlarged view of the sedimentary deposits in the different countries of Europe, exploded the idea of a transition either in mineral structure or organic contents being characteristic of any set of beds, and caused the Transition series to be more accurately classified as Cambrian, Silurian, and Devonian strata.

TRANSKEI TERRITORY is a dependency of the Cape Colony, lying between the Great Kei River (which is the boundary of British Kaffraria) and the borders of Natal. It includes Fingoland, the Galeka country, and No Man's Land. The coast districts from the Umlata to the Natal frontier are still independent, though surrounded, except to seaward, by British territory.

TRANSMIGRA'TION, or the passing from one place, state, or condition into another, means, in the theological acceptation of the term, the supposed transition of the soul after death into another substance or body than that which it occupied before. The belief in such a transition is one of the most important phases in the religions of mankind. It was common to the most uncivilized and the most civilized nations of the earth; it was the object of fantastical superstition, as well as that of philosophical speculation, and it is the property of both ancient and modern times. Its basis being the assumption that the human soul does not perish together with the body, it could belong to those nations only which had already conceived an idea of the immortality of the soul; but in proportion as such an idea is crude or developed, as it is founded merely on a vague fear of death, and a craving for material life, or on ethical grounds, and a supposed causal connection between this and a future life, the belief in transmigration assumes various forms, and influences more or less the actions of men.

The lowest forms of this belief are probably those met with among several tribes of Africa and America, which hold that the soul, immediately after death, must look out for a new owner, and, if need be, enter even the body of an animal. Several negro tribes entertain this belief; they assume that the soul will choose with predilection the body of a person of similar rank to that of its former owner, or a near relation of his; and they frequently therefore bury their dead near the houses of their relatives, in order to enable the souls of the former to occupy the newly-born children of the latter, and the princely souls to re-enter the princely family; and until the soul is thus accommodated, milk, brandy, and food are placed on the grave of the deceased, to keep it, as it were, from starving; and sometimes holes are dug in the grave, to facilitate the soul's egress from it. In North America, some tribes slaughter their captives, to feed with their blood such souls in suspense. The negro widows of Matamba are especially afraid of the souls of their husbands, for at the death of these they immediately throw themselves into the water, to drown their husbands' souls, which otherwise, as they suppose, would cling to them. The natives of Madagascar seem to have invented a kind of artificial transmigration, for in the hut where a man is about to die, they make a hole in the roof, in order to catch the outgoing soul, and to breathe it into the body of another man on the point of death. From these and instances of a similar kind, it will be seen that nations which entertain such a belief in transmigration, assume that the souls of the deceased must continue to dwell upon earth, and that one human being may be possessed of several souls. With them, the final destination of the soul is a matter of comparative indifference; its transition from one body into another a mere matter of chance, devoid—apparently, at least—of any ethical principle, and therefore without any moral effect on the living, except, perhaps, that of a stolid indifference to death, as often manifested in the plantations of the West Indies, where negroes hang themselves, in the belief that their souls will migrate into other countries, and there enjoy a happier life.

Another, more poetical, and in some respects also, more ideal form of this belief in transmigration, is that which occurs in Germanic mythology, and is still entertained in some parts of Germany and England. According to it, the soul, before entering its divine abode, assumes certain forms, or animates certain objects, in which it lives for a short period. Thus, it is supposed to enter some flower or tree, a rose, a vine, a plantain, a pine-tree; or to animate a butterfly, a pigeon, and sometimes also—if a person dies while enchanted or sleeping—a serpent, a weasel, or a mouse. The most popular form of these supposed transmigrations, however, is that of a pigeon, a representation of which bird, therefore, often occurs on the oldest tombstones. When the robber Madej, for instance, under an apple-tree confessed his crimes, one apple after another, transformed into a white pigeon, flew into the air. They were the souls of the persons murdered by him; only one apple remained, because he had not yet confessed the murder of his father; but when he did so, the last apple also—the soul of his father—assuming the shape of a gray pigeon, flew after the rest.

Different from this kind of belief in transmigration is that which is based on ethical grounds. It proceeds from the theory that the human souls, being of divine essence, are originally pure, but during their earthly career, lose of their purity; being destined, however, to regain their original quality, are reborn again and again, until they have become free from fault, and thus worthy of re-entering the place of their origin.

A belief of this nature was entertained by the old Mexicans, and probably also the Druids. It is met with in a more developed form with the old Egyptians; but its real importance it obtained as a tenet of the religion and philosophy of the Brahmanical Hindus and the Buddhists, whence it passed into the doctrine of several philosophers of ancient Greece, and into that of some Jewish and Christian sects.

The ethical and philosophical value which such a belief may have, is necessarily relative. It will depend on what a religion or philosophy may call right or wrong, virtue or sin; it will likewise

depend on the notions which religion or philosophy may entertain on the origin of the human soul, on the cause of its first birth, and on its ultimate destination, whether this destination is the merging of the soul into the essence of its Creator, or a personal immortality; and again, the mode in which such a personal immortality is conceived, will also necessarily influence the mode in which transmigration is supposed to take place.

Where the ideas on these questions have remained crude, the idea of transmigration, too, is but of little ethical or philosophical worth. The old Mexicans imagine that the gods *Ometeuctli* and *Omecihuatl* create in heaven the soul of a child destined to be born, and that by its acts on earth it will either ascend to the abode of the highest felicity, or remain in an intermediate heaven, or fall to hell. The highest goal, situated in the house of the sun with the god *Huitzilopotchli*, is full of pleasure and joy, and is attained merely by the souls of fallen warriors, or those who died in captivity, and women dying in childbirth. The second or intermediate heaven, cool and pleasant, but of moderate enjoyments, falls to the lot of men who are not wicked. The wicked, however, go to the abode of darkness; and in darkness consists their punishment. But those entitled to the second heaven may, if they like, also return to earth, in order to qualify themselves for the highest heaven, if such is their aspiration.

Of the Druids, it is told by classical writers that they believed in the immortality of the soul, and in its migration after a certain period subsequent to death. Little is known of the manner in which they imagined such migrations to take place; but to judge from their religious system, there can be no doubt that they looked upon transmigrations as a means of purifying the soul, and preparing it for eternal life.

According to the doctrine of the old Egyptians, the human race originated after the pure gods and spirits had left the earth; and this they did because the demons, who inhabited the earth, had revolted against them, and therefore tainted it with guilt. But, in order to enable the demons to purge themselves of their guilt, the gods created earthly bodies, which the demons were sentenced to animate, so that by expiations they might regain their state of original purity. And these earthly bodies, united to the demons, are the human race; their souls were therefore created at the same time as that of the gods; and human life—the connection of body and soul—is merely intended as a means of purifying the soul, which had rebelled against its divine nature. All the precepts regulating the course of life are laid down by the Egyptians for this end; and the judgment passed after death, in the palace of Osiris, decides whether it has been attained or not. If it has not, the soul must return to the earth again, to renew its expiations; and according to the nature and measure of the guilt which it had contracted during its previous career, it must form a new union with a human body, or with the body of an animal, or even a plant. But if the soul is declared pure by the judge of the dead, it gradually ascends through the various regions of heaven, to the highest abodes of the gods and pure spirits, presided over by Phtah and Neith.

At the time when in *India* the dogma of transmigration became an integral part of the Brahmanic religion, the Hindus believed that the human souls emanated from a supreme Being, which, as it were, in a state of bewilderment or forgetfulness, allowed them to become separate existences, and to be born on earth. The soul, thus severed from the real source of its life, is bound to return to it, or to become merged again into that divine substance with which it was originally one; but as its nature becomes contaminated with sin through its earthly career, it must, so long as it remains in this world, endeavor to free itself from all guilt, and thus to become fit for its ultimate destiny. Religion teaches that this is done by the observance of religious rites, and a life in conformity with the precepts of the sacred books; philosophy, that the soul will be re-united with Brahman, if it *understands* the true nature of the divine essence whence it comes. So long, therefore, as the soul has not attained this condition of purity, it must be born again, after the dissolution of the body to which it was allied; and the degree of its impurity at one of these various deaths, determines the existence which it will assume in a subsequent life. See INDIA, sec. *Religion and Philosophy;* and UPANISHAD.

Since there can be no proof of the soul's migrations, the detail in which these are described in the religious works of the Hindus, is merely fantastical, and interesting only so far as it affords a kind of standard by which, at various epochs, and by different writers, the moral merit or demerit of human actions was measured in India. Thus, Manu (in the 12th book of his Code of Laws) teaches: 'The slayer of a Brâhman'a—according to the degree of his guilt—is reborn as a dog, a boar, an ass, a camel, a bull, a goat, a sheep, a stag, a bird, a Chân'dâla, or a Pukkas'a. A Brâhman'a, who drinks spirituous liquor, will migrate into the bodies of a worm, an insect, a grasshopper, a fly feeding on ordure, or some mischievous animal. A twice-born who steals the gold of a Brâhman'a, will pass a thousand times into the bodies of spiders, snakes, and chameleons, of aquatic monsters, or of murderous bloodthirsty demons. He who violates the bed of his guru, will a hundred times migrate into the forms of grasses of shrubs, and of creeping plants, of carnivorous animals and beasts with long teeth, or of cruel brutes. Those who inflict injury (on sentient beings), become flesh-eaters; and those who eat forbidden things, worms.

'Thieves become devourers of each other; and those who embrace women of the lowest castes, become ghosts. . . . . If a man, through covetousness, has stolen gems, pearl, or coral, or whatever belongs to the precious substances, he is reborn in the tribe of goldsmiths; if he has stolen grain, he becomes a rat; if kânsya (a composition of zinc and copper), a *hansa* bird; if water, a diver; if honey, a gadfly; if milk, a crow; if juice (of the sugar-cane or the like), a dog; if clarified butter, an ichneumon; if flesh, a vulture; if fat, a shag; if oil, a cockroach; if salt, a cricket; if curds, the crane, called Valâkâ;' &c. A more general doctrine of the migration of souls is based by Hindu philosophers on the assumption of the three cosmic qualities of *sattwa*, i. e., purity or goodness; *rajas*, i. e., troubledness or passion; and *tamas*, i. e., darkness or sin, with which the human soul may become endued. And on this doctrine, again, Manu and other writers build an elaborate theory of the various births to which the soul may become subject. Manu, for instance, teaches that 'souls endued with the quality of *sattwa*, attain the condition of deities; those having the quality of *rajas*, the condition of men; and those having the quality of *tamas*, the condition of beasts.' Each of these conditions, he continues, is, according to the acts or knowledge of the soul, threefold: the lowest, the middle, and the highest. 'The lowest embodiment of the quality *tamas* is inanimate objects, worms, insects, fish, serpents, tortoises, tame and wild beasts; the middle state, to which the same quality leads, is (the state of) an elephant, a horse, a S'ûdra, a Mlechchha or barbarian, a lion, a tiger, and a boar; the highest, that of a public performer, a bird, a cheat, a demon called Rakshas, and a vampire-demon. The lowest condition to which the soul imbued with the quality *rajas* arrives is that of a cudgel-player, a boxer, a public dancer, a man who lives on the use of weapons, and one addicted to gambling and drinking; the middle condition, that of a king, a man of the Kshattriya or military caste, a house-priest of a king, and a man fond of learned controversy; the highest, that of a Gandharva or musician in Indra's heaven, a Guhyaka or Yaksha (two kinds of attendants on the god of riches), or another attendant on another god, or an Apsaras or heavenly nymph in Indra's heaven. The lowest state procured by the quality of *sattwa* is that of a Vânaprastha—or a hermit of the third order of life—a religious mendicant, a Brâhman'a, or one of the demigods traveling about in palace-like cars, one of (the genii presiding over) the lunar mansions, or an offspring of Diti. The middle state, procured by the same quality, is that of a sacrificer, a Rishi (q. v.), a god of the lower heaven (a deity personating one of the) Vedas, (a deity presiding over one of) the luminaries or years, one of the manes or progenitors of mankind, and of the demigods called Sâdhya. The highest condition to which the quality of *sattwa* leads is that of the god Brahmâ, that of a creator of the world (as *Marîchi*, or another patriarch of the same rank), that of the genius of Dharma (virtue or right), of *Mahat*, or the intellectual principle of creation, and of *Prakr'iti*, or matter.' See SANKHYA.

It is not necessary here to show that this detail regarding the migrations of the souls is more or less differently given by other authors at other periods of Hindu religion, according to the views which they entertained of right and wrong, of the value and rank of imaginary or created beings, and of the social conditions of men. For, since all orthodox Hindu writers agree in principle with Manu, the quotations alleged from his work suffice to illustrate the imaginary positiveness with which the doctrine of transmigration was propounded, and to establish the conclusion that this doctrine rested in India on ethical grounds.

It has been already pointed out that the belief in the soul's life after the death of the body must precede the doctrine of transmigration. As such a belief, however, may be traced in some hymns of the *R'igveda* (see VEDA), it has been supposed that this doctrine, too, is as old as this Veda. But apart from the uncertainty which still exists regarding not only the age, but even the relative age at which the different hymns of the *R'igveda* were composed, and setting aside the fallacy which therefore attaches to speaking of this Veda as a contemporaneous whole, it is necessary to observe that the only passage which has been adduced in proof of this important discovery does not bear it out. It is the 32d verse of the hymn I. 164, and according to the translation of Professor Wilson (vol. ii. pp. 137, 138), runs as follows: 'He who has made (this state of things) does not comprehend it; he who has beheld it, has it also verily hidden (from him); he, whilst yet enveloped in his mother's womb, *is subject to many births*, and has entered upon evil.' But the word of the text, *bahuprajâh'*, rendered by Wilson, according to the commentator, 'is subject to many births,' may, according to the same commentator, also mean, 'has many offsprings,' or 'has many

children;' and as the latter sense is the more literal and usual sense of the word, whereas the former is artificial, no conclusion whatever regarding the doctrine of transmigration can safely be founded on it.

The Buddhistic belief in transmigration is derived from that of the Brahmanic Hindus; it agrees with the latter in principle, though it differs from it in the imaginary detail in which it was worked out.

Like the Brahmanic Hindus, the Buddhists believe that all souls have existed from the beginning; like them, they believe in the unreality and sinfulness of the world, in the necessity of the soul's freeing itself from the bondage of this world, and in the causal connection between the actions of man in this, and his condition in a subsequent, life. Like the Brahmanic Hindus, they hold, therefore, that sin is the cause of transmigration, and that by a total expiation of sin, the soul ceases to be reborn, and attains its final resting-place. But since this resting-place is to the Buddhists Nirvâna (q. v.), or Non-entity, whereas to Brahmanism it is Brahman, or the principle of Entity; since they reject the institution of caste, which is the social foundation of Brahmanic life; since they do not acknowledge the authority of the Vedas, and the codes based on it, and therefore consider as morally wrong much that the Brahmanic 'Sâstras enjoin as morally right, the standard according to which the life of a Buddhist is regulated must differ in many respects from that which governs the conduct of a Brahmanic Hindu; and his ideas of reward and punishment, therefore, as reflected by his ideas of the mode of transmigration, likewise differ from those of the Brahmanic believer. To enlarge here on this difference is not necessary, for, after the illustrations already afforded from Manu, it is easy to conceive that the *detail* of the Buddhistic doctrine of transmigration is as fanciful as that of the Brahmanic doctrine; that it is therefore partly devoid of interest, and partly intelligible only if taken in connection with the detail of Buddhistic religion and literature (see BUDDHISM; also LAMAISM). Yet it is not superfluous to point out one great difference which separates the notions of one class of Buddhists from those of the rest, as well as from those of the Brahmanic Hindus. According to the latter, and the great mass of Buddhists, it is always the same soul which ever from its first birth reappears in its subsequent births, until it is finally liberated from transmigration. But among the southern Buddhists, another idea has also taken root. In their belief, the succession of existences of a being is also a succession of souls; and each such soul, though the result of its predecessor, is not identical with it. According to this view, the body dies, and with it the soul, too, is 'extinguished,' leaving behind only the good and bad acts which it has performed during its life.

The result of these acts now becomes the seed of a new life, and the soul of this new life is therefore the necessary product of the soul of the former life. Thus all the succeeding souls have to labor at the solution of the same problem, which began when their first ancestor entered this world, but no succeeding birth is animated by the same soul. This dogma is illustrated in their works by various similes. One lamp, they say, for instance, is kindled at another; the light of the former is not identical with that of the latter, but nevertheless, without this, the other light could not have originated. Or, a tree produces fruit; from the fruit, another tree arises, and so on; the last tree is therefore not the same as the first, though the fruit is the necessary cause of the last.

In Greece, the doctrine of transmigration—or, as it is there called, *metempsychosis*—did not become the belief of the people, but was confined to the teaching of the mysteries and the tenets of philosophers, who probably derived it, either directly or indirectly, from Egypt or India. According to some, Thales (q. v.) was the first Greek philosopher who propounded it; according to others, Pherecydes (q. v.), the teacher of Pythagoras (q. v.); but its importance in Greek philosophy it first obtained through the system of Pythagoras, who, it seems, became acquainted with it through Egyptian sources. After him it was Plato (q. v.) who assigned to it a prominent place in his philosophy; and he probably was indebted to Hindu writers for his views on metempsychosis, as explained in his dialogues, especially in *Phædros*. Plato's doctrine was refuted by Aristotle, but revived, though in a modified shape, by the Neo-Platonists.

Since a belief that the consequences of the acts of man must follow their inevitable course, and can neither be averted nor stopped by the intercession of a divine power, is incompatible with a belief in divine grace, the doctrine of transmigration or metempsychosis could never gain a firm ground in the religion of the Jews and Christians. It deserves notice, however, that in both these religions it found adherents as well in ancient as modern times. Amongst the Jews, the doctrine of transmigration—the *Gilgul Neshamoth*—was taught in the mystical system of the *Kabbala*, which pretends to divulge the secrets of creation and those of the nature of the divine and human soul. 'All the souls,' the *Sohar*, or the book of 'light,' the spiritual code of this system, says, 'are subject to the trials of transmigration; and men do not know which are the ways of the Most High in their regard. They do not know how they are judged in all times, as well before they come to this world as after they leave it. They do not know how many transformations and mysterious trials they must undergo: how many souls and spirits come to this world without returning to the palace of the divine king.' The principle, in short, of the Kabbala is the same as that of Brahmanism. The souls, like all other existences of this world, it teaches, must re-enter the absolute substance whence they have emerged. But to accomplish this end, they must develop all the perfections the germ of which is planted in them; and if they have not fulfilled this condition during one life, they must commence another, a third, and so forth, until they have acquired the condition which fits them for their re-union with God. On the ground of this doctrine, which was shared in by Rabbis of the highest renown, it was held, for instance, that the soul of Adam migrated into David, and will come into the Messiah; that the soul of Japhet is the same as that of Simeon, and the soul of Terah migrated into Job.

Generally, it was supposed by writers of this school, the souls of men are reborn in men, and those of women in women; but also the reverse takes place, as in the case of Thamar, who had the soul of a man, and in that of Judah, whose soul was in part that of a woman. And because Ruth had the soul of Thamar, she could not bear children until God imparted to her sparks of a female soul. If the soul of a man, however, is reborn in a woman, such a migration is held by some to be a punishment for the committal of great sins, as when a man refuses to give alms, or to communicate to others his wisdom. And it is by way of punishment, too, that the soul of a Jew is reborn in a heathen, or in an animal—a clean or unclean beast, a bird, a fish—or even in an inanimate object. Of all these transmigrations, biblical instances are adduced—according to their mode of interpretation—in the writings of Rabbi Manasse ben Israel, Rabbi Naphtali, Rabbi Meyer ben Gabbai, Rabbi Ruben, in the Jalkut Khadash, and other works of a similar character. Modern Kabbalists—for instance, Isaac Loria—have imagined that divine grace sometimes assists a soul in its career of expiation by allowing it to occupy the same body together with another soul, when both are to supplement each other, like the blind and the lame. Sometimes only one of these two souls requires a supplement of virtue, which it obtains from the other soul, better provided than its partner. The latter soul then becomes, as it were, the mother of the other soul, and bears it under her heart like a pregnant woman. Hence the name of gestation or impregnation is given to this strange association of two souls. That all these wild fancies have for their main object the explanation of obscure or mystical passages of the Bible, and the reconciliation of such as are or may seem contradictory, requires no remark; the philosopher, however, must look to their basis, which is purely ethical.

Among the early Christians, St. Jerome relates the doctrine of transmigration was taught as a traditional and esoteric one, which was only communicated to a selected few; and Origenes, like the Kabbalists, considers it as the only means of explaining some biblical traditions, as that of the struggle of Jacob and Esau before their birth, or the selection of Jeremiah when he was not yet born, and many more events which would throw discredit on divine justice, unless they were justified by good or bad acts done in a former life. Of Christian sects, the Manichæans (q. v.) especially adhered to this belief, but the church always rejected it as a heresy.

In concluding, at least one great philosopher of modern times may here be named, as one whose views of the progress of mankind are based on the same doctrine; it is the celebrated German critic, G. E. Lessing, who endeavored to establish it on metaphysical grounds. His arguments are briefly these: The soul is a simple being, capable of infinite conceptions. But being a finite being, it is not capable of such infinite conceptions at the same time; it must obtain them gradually in an infinite succession of time. If, however, it obtain them gradually, there must be an order in which, and a degree to which, these conceptions are acquired. This order and this measure are the senses. At present, the soul has of such senses five; but neither is there any ground to assume that it has commenced with having five senses, nor that it will stop there. For, since nature never takes a leap, the soul must have gone through all the lower stages before it arrived at that which it occupies now . . . . . and since nature contains many substances and powers which are not accessible to those senses with which it is now endued, it must be assumed that there will be future stages, at which the soul will have as many senses as correspond with the powers of nature. And 'this my system,' he concludes his little but important essay, *Dass mehr als fünf Sinne für den Menschen sein können*—in a fragmentary note discovered after his death—'this my system is certainly the oldest of all philosophical systems; for it is in reality no other than the system of the pre-existence of the soul and metempsychosis, which did not only occupy the speculation of Pythagoras and Plato, but

also before them of Egyptians, Chaldeans, and Persians—in short, of all the sages of the East; and this circumstance alone ought to work a good prejudice in its favor; for the first and oldest opinion is, in matters of speculation, always the most probable, because common sense immediately hit upon it.

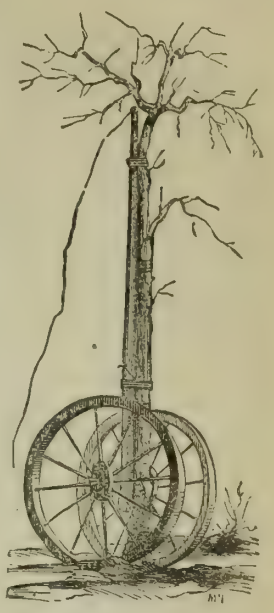
gether.—In a Ship, beams across the sternpost, at right angles to that timber, fastened in the same way as the floors upon the keel.

TRA'NSPADANE REPUBLIC. See CISALPINE REPUBLIC.

TRANSPLA'NTING—the removal of a growing plant from one situation to another—is much practiced with many kinds of cultivated plants, which are reared in a nursery, and *planted out*. Many flowers and culinary plants are generally treated in this way, as well as ornamental shrubs, and fruit and forest trees. It is desirable to have a ball of earth attached to the roots in every case, although this is often neglected. It is also desirable to shade the plant and water it for a few days after transplanting, when possible. Young plants are easily transplanted, as their roots, not having spread far, are raised from the ground without much injury, and this is the thing of first importance in the operation. At a more advanced age, transplanting becomes difficult, great part of the difficulty, however, being mechanical. No plant can be transplanted with safety when in flower or fruit; the plant may live, but the flowers or fruit will almost certainly perish. In like manner, leaves often wither; and transplanting ought, if possible, to be performed in winter, when vegetation is least active.

The transplanting of large trees, in order to immediate effect in the neighborhood of a mansion, has been practised for many years with success. Notwithstanding all the care that can be taken, the trees are *thrown back* for two or three years; but this, in general, is all the injury which they sustain, unless removed from a situation very different from that in which they are placed. It is of great importance, in transplanting trees, that they should be placed in their new situation in the same direction to the prevailing wind as in their former situation. This is often disregarded, and many failures are the consequence. It ought also to be borne in mind, that trees taken from a thick wood, and planted in a lawn, or along the sides of an avenue, cannot be expected to succeed there. They have neither roots nor branches adapted to their new situation, and suffer from unaccustomed exposure to wind and weather. Trees of quick growth, such as limes and poplars, succeed most readily when transplanted; oaks are particularly difficult. In every case, however, there is much hazard, because the roots of trees generally spread far from the stem, and when the operation is unskilfully performed, the principal roots are often cut off, and the smaller ones torn by the violence used, whilst all are injured by being laid bare. Trees thus treated seldom ever again assume a healthy appearance. The method is therefore now generally adopted of preparing the tree for transplanting by digging a trench around it, at least two years beforehand, at such distance as is thought expedient, cutting the roots all round, except two or three which are left to hold the tree fast, and then filling up the trench with fresh soil of the best quality that can be procured, into which a vast number of young roots are speedily thrown out. When the tree is to be removed, a new trench is made immediately on the outside of the former trench, and young roots sufficient for the nourishment of the tree are thus preserved. The ball of earth being generally too heavy for removal, is reduced in size by a very careful picking away of earth, so that the rootlets shall be as little as possible injured or even laid bare.

The tree is generally transported to its new situation by attaching it firmly to a pole fixed upon an axle with a pair of wheels, the ball resting upon the axle. Good soil is put into the pit dug for it, and the roots are spread out. The tree is stayed by sticks and ropes till it is well established, and heavy stones are also laid on the top of the ball, or large beams of wood are laid across it, and firmly fastened to the ground at both ends. An improvement on this method has been effected by the use of a compost of vegetable mould, decayed leaves, &c. in preparing the tree for transplanting, not only in the trench dug around it, but on the top of the ball itself, so that the tree is encouraged to send out many new rootlets. A still greater improvement consists in the use of a machine by which a large ball of earth can be removed along with the tree, so that it is no longer necessary to pick away any part of the soil or to lay bare the young roots; whilst the tree being carried in a vertical instead of a horizontal position, all possibility of damage in this process is avoided. One of the machines used for this purpose consists of two pair of wheels, about 15 feet apart, each pair on a strong axle; the first pair smallest, and in a very large machine about 5½ feet in diameter; the second pair 7 feet. A strong frame rests on each axle to raise the horizontal bearers to a sufficient height. The front frame turns on a horizontal wheel, as in a carriage, for easy turning of the whole machine. Resting on the two frames are two strong horizontal beams of wood, above which are two short cross beams, with jack screws and strong chains for raising the tree. Beneath the roots and ball of earth, when the tree is raised from the ground, strong planks are placed, supported by chains from the beams. In order to raise the tree from its place, a sloped cutting is made, and the tree is drawn gradually up the inclined plane.



Transplanting Apparatus.

TRA'NSPORT, MILITARY AND NAVAL. Without a powerful system of transport, an army is helpless. To cross a sea, a large fleet of vessels properly fitted for men and horses, is requisite. When the English army, of about 30,000 men, crossed, in 1854, from Varna to the Crimea, it took 600 vessels to carry them, without any reserves of stores or food.

Not less important to the army moving by land is its transport. On entering battle, infantry and cavalry usually carry three days' rations with them, and 60 rounds of ammunition. The moment these are exhausted, they become dependent on the transport department for their replenishment. The first reserves are immediately in rear. To bring up supplies from these, and to keep these reserves themselves supplied, is the duty of the Military Train (q. v.) as regards food, and of the field-train in respect of ammunition. Between the grand dépôt and the base, the operation is generally intrusted to the wagons and beasts of the country, driven by natives, of course under proper military control. The amount of transport required by an army seems almost fabulous. The lowest computation must put one animal to four fighting-men. In addition to the transport of food and ammunition, the wounded and sick have to be carried, both from the field to the hospitals and during a march.

In the British army, the direction of the transport rests with the quartermaster-general: in the French army, it is under the *Intendant*, who is over all the administrative departments.

TRANSPORTA'TION, from the Latin for carrying across, means the removing of persons from one territory to another; and is thus distinguished from banishment, which is the mere driving of persons out of the country in which they live. Transportation, in this country, means a removal beyond seas, and has been in use to express the punishment of crime in that manner. The practice was known to the Romans; and transportation to Sicily will be found referred to in Cicero's charges against Verres. When the English monarchs had possessions on the continent, there was much jealousy about their carrying off troublesome persons to these dominions, and thus bringing them under irresponsible power. The legal transportation of criminals from the British dominions began early in the 17th c., when they were removed to the Plantations in America, and treated as slaves. This practice continued, under modifications, until it was stopped by the American revolution. Its unfitness as a punishment is obvious. The

amount of infliction would depend, not on the extent of the criminal's guilt, but on his master's humanity. There were even worse evils; for young lads were kidnapped in Britain, and sold to the planters, and these victims were often unable to prove, even when they had an opportunity, that they were not legally transported for offences. When this method of getting rid of convicts ceased, there was great alarm that Britain would be overrun with crime, and it was hailed as a deliverence when the government resolved to establish a penal colony in Australia. The first convicts were conveyed thither in 1787. Such was the beginning of the famous colony of Sydney, or Botany Bay. Between the years 1820 and 1830, the system was at its full perfection; but though thousands were annually removed, crime did not appear to decrease. It was forgotten, that the predatory and fraudulent offences, which are by far the greater number in this country, are trade as well as crime; and that where there is a large portion of the population, as there unfortunately is, prepared to have recourse to crime whenever it pays, the place of those removed is immediately supplied.

When the criminals were sent to the antipodes, the mistake was made of supposing that they took the crime of the country with them, and that there was so much less need for precautionary measures at home. During thirty years, however, the greater proportion of the class of criminals who used to be transported, have been retained in this country, and liberated in it at the end of their punishment. This practice has been accompanied with two classes of precautionary measures—an improved police, and the reformation of juvenile delinquents. To these influences have been added free trade, and the consequence of all is, that crime is diminished to the extent of between a third and a half of what it was 20 years ago. In 1838, a committee of the House of Commons issued a celebrated Report on the effect of transportation. It was shown to be still an extremely unequal punishment—in some instances giving rogues an opportunity of making their fortune, in other cases subjecting men less depraved, but more infirm in temper, to punishments of the most frightful kind. It was found to be accompanied by the prevalence of crimes which cannot be mentioned, and with a vast amount of general demoralization in the convict settlements. Yet it was found not to have much terror for the criminal classes, who heard more about the success than the hardships of transportees. In 1840, transportation to New South Wales came to an end; and by a succession of statutes, sentences to penal servitude were substituted for sentences to transportation. In 1868 transportation to Western Australia also wholly ceased, to the great benefit of the whole continent. The practice of transportation cannot, it will be easily understood, be carried out by governments which have no colonies, though Russia manages it by possession of the desolate region of Siberia. It is a curious circumstance that the practice began in France just as this country was abandoning it.—See CONVICT, PRISON DISCIPLINE, and TICKET OF LEAVE.

TRANSPO'SE, in Music, is to change a piece of music in performance from the key in which it is written to another key. To play at sight an accompaniment for such an instrument as the pianoforte or organ, transposed from one key to another, requires considerable artistic skill. To the singer, transposal presents no difficulties.

TRANSUBSTANTIA'TION (Lat. *transubstantiatio*, change of substance, from *trans*, over, and *substantia*, a substance), a word used by the scholastic writers of the Roman Catholic Church to designate the change which is believed by Roman Catholics to take place in the Eucharistic elements of bread and wine, in virtue of the consecration. Under the head REAL PRESENCE (q. v.), which is often loosely comprehended under the larger name of transubstantiation, the doctrine of Catholics as to the presence of the body and blood of Christ in the Eucharist, after consecration has been fully explained. There remains, however, beyond this doctrine as to the presence of Christ, a further inquiry concerning the elements of bread and wine which had existed in their natural condition before the consecration. For Sacramentarians (q. v.), this question is easily resolved. But those Protestants who hold in common with Catholics the reality of Christ's presence, differ from them as to the co-presence of the substance of bread and wine after consecration. Some Anglican divines, who hold the real presence of the body and blood, would appear to content themselves with remaining silent as to the mode of the presence. Dr. Pusey goes so far as to say, that the dispute between Anglicans and Romanists is 'probably a dispute about words' (*Eirenicon*, p. 229). The Lutheran views as to the mode of the presence have been explained under the heads IMPANATION, REAL PRESENCE (q. v.).

According to the Catholic doctrine, which has been explicitly defined as an article of faith (Council of Trent, Sess. xiii. Can. 2), 'the whole substance of the bread is changed into the body of Christ, and the whole substance of the wine into His blood, the species alone remaining.' What is the precise philosophical meaning of the word 'species,' called also 'accidents,' in this definition, is not declared; but in popular language it may be described as simply meaning the appearances, that is to say, those qualities or conditions of bread and wine which produce upon the senses the impression of the presence of bread and wine. It is not taught, however, that in the change called transubstantiation, the body and blood of Christ are formed out of the substance of the bread and wine, but that, in virtue of the Eucharistic consecration, the substance of bread and wine cease to exist, and that the body and blood of Christ take their place; nor that the body and blood of Christ become what the schoolmen call the 'subject' of the 'accidents' of the bread and wine, but merely that, by a miraculous suspension of the ordinary law, the senses still continue to receive from the Eucharistic elements all the same impressions which they had previously received from the bread and wine; viz., of color, taste, smell, solidity, extension, figure, &c.

The history of the controversy regarding transubstantiation is sketched in the article LORD'S SUPPER. The objections to the doctrine have been chiefly drawn from the philosophical difficulties which are involved in it; and the defenders of it have, for the most part, contented themselves with resting on the proofs which they profess to draw from Scripture and tradition, and a general demonstration that the doctrine, although mysterious, does not involve any philosophical repugnance or impossibility, and that the philosophical arguments against it are at the least not conclusive. Some Catholic philosophers have even undertaken to demonstrate the possibility of transubstantiation by philosophical arguments; and it is especially remarkable that the celebrated Leibnitz (q. v.) has not only entered at great length, and in several portions of his works, into this philosophical discussion, but professes to prove, by strict philosophical principles—by the consideration of the properties of matter, of substance, of space, extension, and the like—that the essential principle of the body 'may exist in many places at the same time, nay, under far-distant and distinct species.'

TRANSVAAL (i. e., 'across the Vaal'), in South-east Africa, till 1877 a republic, from 1877 till 1881 a British territory, and now under the suzerainty of the British sovereign. It includes the country north of the Vaal River, and on both slopes of the Magaliesberg or Cashan Mountains, into which the immigrant Boers retired after the annexation of the Orange River Free State, in 1848, to the British crown. Its limits lie between lat. 22°—27° S. and long. 25°—32° E. The N. boundary of the republic may be described as formed by the Oori or Limpopo River, here running nearly from west to east; its E. boundary by the continuation of the Drachenberg Mountains, separating it from the coast-region, inhabited by the Zulu Kaffirs; on the S., it has the Vaal River from its source, dividing it from the Free State Republic; while on the W., an undefined line separates it from the Betjuana tribes, still independent, living along the edge of the desert region of the Kalihari. Thus, an area of not less than 114,000 sq. m. was more or less under the control of the emigrant Boers, who were not very scrupulous in their dealings with the poor native tribes who lived, or live still, in the country they now occupy. This region may be described in general terms as a vast plateau, sloping to the north, supported by the coast-line of mountains, which, presenting a bold mural buttress, or escarpment, to the low country at their feet, stretch away on their western flank into vast undulating plains. At right angles to the coast-range, another belt of very high lands, called the Magaliesberg, runs east and west, forming a watershed between the river-system of the Vaal or Orange and Limpopo rivers. The southern face of this range also presents long and undulating plains, generally well watered and wooded, and abounding with large game. The chief exports of the T. are ostrich feathers, wool, ivory, cattle, cereals, tobacco, &c.

The average height of the plateau inhabited by the emigrant farmers of European descent is from 4000 to 5000 feet. Many of the peaks of the mountain-range traversing the plateau attain an elevation of 9000 or 10,000 feet, and are covered with snow some months in the year. The altitude of the coast-line of mountains is considered at from 6000 to 7000 feet above the low region at their feet.

The principal towns are—Mooiriverdorp, or Potschefstroom, on the Mooi River; Pretoria, about 100 miles north-east of Potschefstroom, the seat of the local government; Leydenburg, 170 miles north-east of Pretoria; Rustenberg, a few miles north of the Magaliesberg; and Zoutpansberg, the most remote village inhabited by men of European descent in S. Africa, about 40 miles south of the Limpopo River.

The population consists of emigrant farmers, and a mixture of deserters and foreign refugees from the Cape Colony and Natal. Their number is about 50,000 souls. Scattered through the country are numerous kraals of Betjuans and other tribes, in number about 775,000, whom the Boers compelled to supply labor. The republic was established in 1840, and recognized by Britain in 1852. The budget for 1878 gave the revenue at £105,130, and the

expenditure at £152,000. According to a treaty entered into between Portugal and the T. Republic, the latter enjoyed free transit of all goods through the Portuguese harbors on the east coast; and in order to save the import dues levied by the colony of Natal, industrious efforts were made to secure direct access, by road and rail, to Delagoa Bay. As this line passed through the dominions of an independent chief, the Boers were soon embroiled in desultory war with the latter. Their policy further provoked so intense excitement amongst the natives upon the Kaffrarian frontier of the Cape Colony, and so seriously menaced the wellbeing of the British settlements, that Britain interfered, and ultimately, on the 12th April 1877, annexed the territory of the republic.

A rising of the Boers took place in the end of 1880. The British garrisons in the T. were besieged, and a force of Boers crossed into Natal to meet the available British forces advancing against them. The Boers took up a strong position at Laing's Nek, within the Natal frontier, from which the English forces failed to dislodge them; and in several engagements the Boers more than held their own. Peace was negotiated while large English reinforcements were on their way to South Africa. It was agreed that the T. should acknowledge the suzerainty of the British sovereign; and, while complete self-government is granted to the Boers, the control of foreign relations (i. e., specially with the native tribes) is reserved.

With regard to the social aspect of the country, very marked progress has been made within the last few years. The large influx of Europeans and colonists of a more educated class than the original settlers, has produced very marked effects. The state church has been the Dutch Reformed, but all other creeds are tolerated.

The climate is generally healthy, although north of the Magaliesberg its tropical nature begins to manifest itself. Hot winds and violent thunder-storms prevail in the summer months. The fly *Tsetse*, whose bite is death to the bovine and equine species, abounds in many parts, and renders traveling with oxen and horses difficult.

When Captain Harris visited this region 50 years ago, the number of the larger mammalia found by him was enormous; and even Gordon Cumming, who hunted over part of it many years subsequently, found them still numerous. Crocodiles are numerous in the rivers, and a large species of boa is found.

The first diamond discovered in South Africa was found in October 1866, north of the Vaal River, and since then diamond mining has been carried on with great success in that district. Diamonds have also been found in the districts of Marico, Waterberg and Pretoria. Gold has been discovered in quartz reefs and alluvial deposits near Marabastad, 180 miles N. of Pretoria; also near Leydenburg, where mining is actively prosecuted; and the gold-bearing strata are supposed to extend for hundreds of miles in various directions. The country is also rich in other minerals, such as copper, lead, iron, tin, and coal.

The T. is rich in corn-land, and might become the granary of the interior. See Aylward's *The T. of To-day* (1879); *The T.*, its Natural Features, Industries, Populations (pub. by Silver, 1881).

TRANSYLVA'NIA (called by the Hungarians *Erdély-Orszag* —Walach. *Arjal*—' the woody and mountainous country;' by the Germans *Siebenbürgen*, 'seven castles,' from the seven forts built by the Saxons which became nuclei of cities; and by the Romans *Transylvania*, from its position *beyond* the forest range which stretches southwards from the Carpathians, and forms its western boundary) is the most easterly territory of Austria, and since 1868 has been completely incorporated with Hungary, of which it now forms the eastern portion. The area is 21,150 square miles; pop. (1880) 2,116,132. Of the pop. of 2,115,024 in 1869, 1,200,400 were Walachs and Roumanians, 573,000 Magyars and Szeklers, 235,000 Germans, the rest being Slavs, gipsies, Armenians, Jews, Italians, &c. Classed according to their religious professions, 652,945 were Non-united Greeks, 600,800 Greek-Catholics and Armenians, 505,540 Protestants, 263,769 Roman Catholics, and 24,848 Jews. T. is an elevated plateau (its lowest parts being 530 feet above sea-level) of an irregular form, somewhat resembling a triangle of which the upper part has been irregularly removed, and is bounded partially on the north, and wholly on the east and south, by a high range of mountains—a continuation of the Carpathians—which sends out innumerable lateral ridges towards the center of the country, and along the western frontier, so that T. is an almost perfect natural fortress. There are no plains except where a river-basin widens out; but the valleys are numerous and exceedingly picturesque. Almost the whole country is drained westwards into the Danube, by the Theiss and its feeders in the north, and by the Maros, a tributary of the Theiss, and its feeders, in the center and south; the south-eastern corner is drained by the Aluta, or Alt, which, after a winding course, breaks through the southern bounding range near Hermannstadt; while a number of streamlets worm their way through the eastern range, and join the Sereth. The climate is more healthy and temperate than that of Hungary, the mountain chain along the southern frontier keeping off the hot winds.

The soil is extremely fertile; but much arable land is still uncultivated. The valleys and hill-sides supply abundant pasturage for numerous herds of cattle and droves of horses; the cultivated districts yield good crops of maize, rye, barley, oats, all sorts of leguminous plants, tobacco, saffron, madder, hemp, and lint. The culture of fruits is extensively practised, and immense quantities of apricots, peaches, plums, apples, pears, and walnuts, are annually produced. The extensive forests, which cover nearly 5,300,000 acres of ground, contribute largely to the wealth of the country. The vine is extensively cultivated, and, in spite of the defective mode of preparation, the produce is excellent in quality. The mineral wealth of T. is great; gold is found more abundantly than silver, and silver than copper; yet there are few gold mines regularly worked, and a thorough investigation of the extent to which this valuable metal exists in the country, seems never to have been made. Iron is found in abundance at Torockzo, copper at Balan, lead at Rodna; the other minerals are mercury, manganese, antimony, sulphur, arsenic, vitriol, alum, marble, &c. Coal is not absent; but firewood is so abundant and cheap, that no other combustible has been sought for; and even the extensive tracts of peat have been allowed to lie undisturbed. Rock-salt is abundant. T. has almost no manufactures, and the commerce, owing to the isolation of the country, the want of enterprise of its inhabitants, and the absence of good roads, is far from bearing a fair proportion to the amount of the country's produce.

Of the various races which now inhabit T., the Walachs, the earliest possessors, though by far most numerous, were till recently subordinated to the other races of T., but since the revolution of 1848—1849, have acquired a position in the country which, by all means, honest or dishonest, they are striving to improve; the Magyars entered as conquerors in the 10th c., and still constitute the nobility and gentry of the land; the Saxons were introduced in 1143 and 1247 from the Rhenish provinces of Lower Saxony, by kings Geysa II. and Bela IV. of Hungary, and received special privileges and immunities to induce them to settle in the country, and improve the cultivation of the soil; and the Szeklers, or Szekhelyi, are believed to be the descendants of the once formidable Huns. The last three are the dominant races of T., and live apart from each other—the Magyars occupying the west and center, the Saxons the south and north-east, and the Szeklers the south-east. The Magyars, Bulgarians, and Armenians speak the Magyar language as used in Hungary; the Saxons employ Low German in speaking, and High-German in writing, but with a considerable mixture of Magyar in both; the Szeklers speak a Turanian dialect; and the Walachs use their own language intermixed with corrupt Latin. T. is little noticed in history till the Christian era, when part of it was occupied by the warlike Dacians, soon after whom the Sarmatian tribes of the Jazyges and Carpi settled in it. The conquest of the Dacians by Trajan, however, did not include that of the other two peoples, who proved very troublesome to the Roman settlers along the Danube, till they were conquered by Diocletian, and the Carpi carried away to Pannonia and other districts.

In the middle of the 4th c., the Goths overran the country, defeating the Sarmatians in a great battle on the Maros, in which the monarch and the chief of his nobility perished; and they in their turn were forced, in 375, to retire before the Huns and their confederates. The Gepidæ next took possession of T. till their almost complete extirpation, in 566. by the Lombards and Avars. It was conquered by the Hungarians about 1000, and was governed by Woivodes till 1526, when the death of the Hungarian monarch at Mohacs prepared the way for the union of the two countries under the Woivode, John Zapolya; but the war which thence arose with the Austrians caused their complete severance, and Zapolya's sway was, in 1535, confined to T., of which he became sovereign lord, under the protection of the Turks. T. on its conquest by the Hungarians, was only partially settled; the eastern part constituted a grazing-ground for wandering tribes who had migrated thither. The Saxons were summoned by the Hungarian monarchs to act as a counterpoise to the increasing power of the nobles; and from similar motives the Burzen land was given to the Teutonic Knights, but the arrogant bearing of those soldiers of the cross soon offended their titular lord, and they were forced to leave the country. The 'golden charter' of King Andrew II. (1224) secured a perfectly free political system to the Saxons, whose 'comes' or chief was, like the head of a clan, both judge and leader, and from whom the only appeal was to the king in person. The firm protection and generous treatment accorded to the Saxons by the Hungarian monarchs were rewarded by steadfast loyalty, and succor in men and money whenever required. During the rest of the 16th c., the country was distracted by the bitter strife between the Catholic party, who were supported by Austria, and the Protestant party, who were allied with the Turks; the latter party, headed successively by princes of the houses of Zapolya and Bathory, generally maintaining the superiority.

The next chief of the Protestant party was the celebrated Botskay, whose successes against Austria extorted from the emperor an acknowledgment of the independence of T. in 1606. To him succeeded Bethlem Gabor, the determined foe of Catholicism and Austria, who did important service during the Thirty Years' War. Between his son and successor, Stephen, and Ragotski arose a contest for the crown, in which the latter prevailed; but on Ragotski's death, the civil war was resumed, till the complete rout of the Austrians by the Turks, under Kiupruli, placed the sceptre in the hands of Michael Abaffi, who reigned, till his death in 1690, as a vassal of the Porte. The Austrians now again possessed themselves of T., despite the heroic resistance of Ragotski; and though Tekeli (q. v.) succeeded for a brief period in rolling back the invaders, the peace of Carlovitz, in 1699, again put them in possession; and after the death of Michael Abaffi II., in 1713, T. was completely incorporated with Hungary. It was erected into a grand principality in 1765. During the insurrection in 1848, the Hungarians and Szeklers joined the insurgents, and forced T. to reunite with Hungary, despite the opposition of the Saxons; and the Walachs, still little better than a horde of savages, were let loose over the land to burn, plunder, and murder indiscriminately; the prostration of the country being completed in the following year during the bloody conflicts which took place here between Bem and the Russian troops. In the same year, T. was again separated from its turbulent neighbor, and made a crown-land; the portions of it which had, in 1835, been annexed to Hungary being restored, as well as the Transylvanian Military Frontier, in 1851. In 1867 T. was again united with Hungary. It is now a province under the Hungarian Crown, and is officially styled a grand-duchy. See *Transylvania, its Products and its People*, by C. Boner (Lond. 1865).

TRAP or TRA'PPEAN ROCKS, an important section of the Igneous Rocks (q. v.), associated with Primary and Secondary strata, so called from the Swedish *trappa*, a stair, because these rocks, having resisted, from their greater hardness, the abrading influences which have destroyed the softer sedimentary strata, stand out like huge steps on the faces of the hills and mountains in some place where they occur. Unlike granite, the Trap Rocks are free from silica crystallizing as a separate constituent of the rock; from the modern volcanic rocks the structural difference is very slight, consisting only of the manner in which the silicate of magnesia and lime, common to both, it crystallized—in the older rocks appearing as hornblende, while in the newer it exists as augite.

Trap Rocks are composed of felspar and hornblende, and the different varieties founded on the chemical composition of the mass depend on the relative proportion of these two minerals. When the felspar predominates, the rock belongs to the felspathic trap or felstone series; and when the hornblende is abundant, it is a hornblendic trap or greenstone. This latter series contains the best known Trappean Rocks. The dark hornblende preponderates, and gives to the rock a dull green color, from which it derives its well-known name greenstone, a translation of the German *grünstein*. It has, however, been shown by Delesse that many Trappean Rocks owe their color to a dark variety of felspar which exists in them, and such rocks belong rather to the felspathic than to the hornblendic series. Some greenstones are very light green, others are so dark as to appear black, and all intermediate shades of color occur. These rocks vary also very greatly in texture: in some, the crystals are sufficiently large to be detected with the naked eye; while others are so fine-grained and compact that it is difficult to resolve the separate crystals even with the help of a lens.

Experiments have shown that the size of the crystal in an igneous rock increases in proportion to the length of time during which the mass remains fluid, and so permits the continued crystalline segregation of its various ingredients. The vitreous trap and obsidian would accordingly represent a speedily cooled flow of liquid rock. In fine-grained basalt, the crystalline force has been slightly developed; while greenstones of different textures exhibit its more continued operations in proportion to the coarseness of their texture. The principal varieties of hornblendic trap are greenstone, whinstone, or trap proper. When the crystals are extremely minute, and there is a tendency in the rock to become columnar, it is a basalt. If the felspar is a soda-felspar, either albite or oligoclase, it is diorite. Euphotide, diallage rock, or gabbro, is a compound of Labrador felspar and diallage, a variety of hornblende; it is a coarse, or sometimes fine-grained rock, with a granitic or porphyritic aspect. Hypersthene rock, or hyperite, is made up of Labrador felspar and hypersthene, another variety of hornblende; it is also a granitic-looking rock, very tough, and of a grayish or greenish-black color: it is very abundant in the Isle of Skye. Different varieties of hornblendic trap are based upon the structure of the rock, as well as upon its chemical composition. Trappean obsidian is not a common rock, but it is occasionally found. Prophyritic trap is more abundant; a very black variety has received the name of metaphyre. Amygdaloid is a trap with round or almond-shaped cavities, filled with agate, calcite, or other minerals, scattered through it. Trap tuff consists of fragments of scoriæ, volcanic dust, and pieces of other rocks, forming a coarse irregular mass, sometimes bound together by a calcareous cement.

The characteristic rock of the felspathic series is felstone, compact felspar, or petrosilex. It is a light-colored, greenish, or bluish, very compact, homogenous, and translucent rock, with a flinty-looking appearance. It forms a large proportion of the contemporary intruded Trap Rocks in the Silurian measures of Wales. Clinkstone, or phonolite, is a variety found in layers or slabs which give a metallic ring when struck with the hammer. Aphanite, or cornean, scarcely differs from true felstone, except that it is a more compact and tougher rock. Pitchstone, or retinite, is a vitreous felstone, less glassy than obsidian, and of a green color and resinous luster: a dyke thirty feet wide occurs on the eastern shores of the island of Arran, cutting through the sandstone rocks. When distinct crystals of one or more minerals are scattered through an earthy or compact base of felstone, a felspathic porphyry is formed. The ancient red porphyry of Egypt, known as *rosso antico*, belongs to this set of rocks; it consists of a red felspathic base, in which are disseminated rose-colored crystals of oligoclase, with some plates of blackish hornblende and grains of oxidized iron-ore.

As true igneous rocks come up from below, there is always a connection of some kind between the ejected mass and the inferior source of supply, except when the ejected materials have been subsequently arranged by atmospheric or aqueous agency. Pipes and dykes form such connections, and they are generally associated with tabular masses which have either spread themselves over the surface, or inserted themselves between the beds of the sedimentary strata. When the materials have been mechanically arranged, the igneous rocks are contemporaneous with the deposits in which they occur; but in all cases where strata are cut through by dykes or pipes, or are covered by flows of liquid rock, the igneous rocks are newer than the sedimentary strata with which they are associated.

TRA'PA, a genus of plants, of the natural order *Haloragiaceæ* (q. v.), having a 4-parted calyx, a 4-petallous corolla, and a nut on which the altered calyx appears in the form of spines; the cotyledons very unequal in size. All the species are aquatic plants, with floating habit. *T. natans*, the WATER CALTROPS, is the only European species. It is found in ditches and ponds in the south of Europe, and is grown in ponds in Holland. The floating leaves are rhomboidal, toothed, and smooth; those under water are cut into capillary segments. The fruit has four spines; the kernels are large and almond-like. They are good to eat, either raw or roasted, and somewhat resemble chestnuts in taste. They are often used in soups. The French name is *Marron d'Eau* (Water Chestnut).—*T. bispinosa*, the SINGHARA NUT, affords a great part of the food of the inhabitants of Cashmere, and a tax laid upon it by Runjeet Singh yielded a large sum annually. —*T. bicornis* is much cultivated in China, where the cultivation of aquatic plants is carried on to a degree unknown in other parts of the world, and its fruit is much used for food. In both these species, the nut has only two spines.

TRA'PANI (anc. *Drepanum*), one of the principal seaports of Sicily, on Cape Trapani, in the north-west of the island; capital of the province of that name, 40 miles west of Palermo. Pop. (1881) 31,742. The town is walled, and defended by a fortress. The streets are wide, and well paved with flagstones. There is a natural harbor, capable of admitting vessels of about 300 tons; a handsome town-house; a tower built by the Saracens; a cathedral; and many churches, some of which contain fine paintings. The inhabitants are engaged in the tunny, anchovy, and coral fisheries. The coral is brought from the coast of Barbary to T. to be cut and polished for exportation. T. is a busy town, and exports sumach, salt, soda, coral, alabaster, wine, tunny, and anchovies.

Ancient *Drepanum* was probably founded by the Carthaginians, under whom it became an important stronghold. Here took place a celebrated naval engagement between the Romans, under P. Cladius, and the Carthaginians, under Adherbal, 249 B.C., in which the former were completely beaten. In Roman history, the name scarcely appears, but it seems to have flourished in obscurity both then and during the middle ages.

TRAPE'ZIUM (Gr. *trapezion*, a little table) is the general term for a four-sided plane figure, and is synonymous with 'quadrilateral.' But since all four-sided figures which have parallel sides possess distinctive appellations, the term trapezium is frequently restricted to quadrilaterals whose sides are not parallel. The trapezium, in the restricted sense (exclusive of parallelograms), has some remarkable properties: thus, if its sides be bisected, and the adjacent points of bisection joined, the resulting four-sided figure is a parallelogram; the sum of the squares of its diagonals is equal to the sum of the squares of the sides, together with four

times the square of the line joining the middle points of the diagonals; if it can be inscribed in a circle (i. e., if its four corners are in the circumference of any circle), the one pair of opposite angles is equal to the other pair, and the sum of the rectangles by each pair of opposite sides is equal to the rectangle by the diagonals; if it can be described about a circle (i. e., if a circle can be made to touch on the interior, each of the four sides), the one pair of opposite sides is equal to the other pair.

TRA'PEZOID, a plane quadrilateral which has two of its sides parallel, and the other two not.

TRA'PPIST ORDER, The, celebrated among the religious orders of the Roman Catholic Church for its extraordinary austerities, is so called from La Trappe, an abbey of the Cistercian order, founded in the middle of the 12th century. The discipline of this monastery, in common with many others of the more wealthy monastic bodies, especially of those which, by one of the corruptions of the period, were held *in commendam*, had become very much relaxed; and in the 17th c. but little trace of the ancient religious observance remained. In the first half of that century, the abbey of La Trappe fell, with other ecclesiastical preferments, to the celebrated Armand Jean le Bouthelier de Rancé. The circumstances which led this remarkable man to undertake a reform of his monastery, and in the end the establishment of what was equivalent to a new religious order, have been already detailed in the article Rancé (q. v.). It was in the year 1662 that he entered in earnest upon his duties, and commenced his reforms. At first, he encountered decided, and even violent opposition from the brethren; but his firmness and vigor overcame it all. He himself, as an evidence of a complete change of life, entered upon a fresh novitiate in the year 1663; and in the following year, made anew the solemn profession, and was reinstalled as abbot. From this time may be dated the introduction of the new austerities which have characterized the order. The monks were forbidden the use of meat, fish, wine, and eggs. All intercourse with externs was cut off, and the old monastic habit of manual labor was revived.

The reform of De Rancé is founded on the principle of perpetual prayer and entire self-abnegation. By the Trappist rule, the monks are obliged to rise at two o'clock A.M. for matins in the church which lasts till half-past three; and after an interval occupied in private devotion, they go at half-past five to the office of prime, which is followed by a lecture. At seven, they engage in their several daily tasks, indoors or out, according to the weather. At half after nine, they return to the choir, for the successive offices of terce, sext, and none; at the close of which they dine on vegetables dressed without butter or oil, and a little fruit. This meal is succeeded by manual labor for two hours, after which each monk occupies an hour in private prayer or reading in his own cell until four o'clock, when they again assemble in the choir for vespers. The supper consists of bread and water, and after a short interval of repose, is followed by a lecture. At six o'clock, they recite complin in choir, and at the end, spend half an hour in meditation, retiring to rest at eight o'clock. The bed is a hard straw mattress, with a coarse coverlet; and the Trappist never lays aside his habit, even in case of sickness, unless it should prove extreme. Perpetual silence is prescribed, unless in cases of necessity. The minor practices and observances are devised so as to remind the monk at every turn of the shortness of life and the rigor of judgment; and the last scene of life is made signal in its austerity by the dying man being laid during his death-agony upon a few handfuls of straw, that he may, as it were, lay aside upon the very brink of the grave even the last fragment of earthly comfort to which the necessities of nature had till then compelled him to cling.

The reformed order of La Trappe scarcely extended beyond France in the first period of its institution. The inmates of La Trappe shared, at the Revolution, the common fate of all the religious houses of France: they were compelled to quit their monastery; but a considerable number of them found a shelter at Valsainte, in the canton of Freiburg in Switzerland. In the vicissitudes of the revolutionary war, they were driven from this house; and a community numbering about 250, together with a large number of nuns, who had been established for purposes of education, found refuge at Constance, at Augsburg, at Munich, and eventually, under the Czar Paul, in Lithuania and White Russia. Later in the course of the war, small communities obtained a certain footing in Italy, Spain, America, England, and notwithstanding the prohibitory law, even in France, at Mont Genevre. After the Restoration, they resumed, by purchase, possession of their old home at La Trappe, which continues up to the present time to be the head monastery of the order, and numbers nearly 200 members. During the course of the last 50 years, they have formed many establishments in France; a few in Germany; a very considerable one at Mount Melleray, near Cappoquin, in the county of Waterford, Ireland; and others with still more extensive territory annexed in Kentucky, Illinois, and other states of North America. A modification of the T. O., called 'Trappist Preachers,' was established about 30 years since, at Pierre-qui-Bire, near Avallon.—See Gaillardin's *Trappistes; ou l'Ordre de Citeaux au 19 Siècle* (Paris, 1844).

TRASH. See Sugar.

TRASIME'NUS LACUS, the ancient name of an Italian lake (*Lago Trasimeno*, or *Lago di Perugia*) lying between the towns of Cortona and Perugia. It is about 10 miles in length by 8 in breadth; the greatest depth is not above 30 feet. The lake has no apparent outlet, and the margins are flat and overgrown with reeds. It is surrounded on all sides by hills, those on the north side, extending from Cortona to the lake, being known as the Gualandro Hills—the *Montes Cortonenses* of Livy—covered at the present day with oak, vine, and olive plantations. The lake contains three islands. T. L. is memorable chiefly for the great victory obtained by Hannibal in 217 B.C. during the Second Punic War, over the Romans, under their consul, C. Flaminius. Hannibal leaving Fæsulæ, passed close by the camp of Flaminius at Arretium, laying waste the country as he proceeded in the direction of Rome. This, as the Carthaginian general intended, induced the consul to break up his encampment, and follow in pursuit. Hannibal in the meantime taking up a strong position on the hills on the north side of the lake, along which he was passing. The consul, coming up early next morning, when the whole place was enveloped in mist, saw only the troops in front on the hill of *Tuoro*, with whom he was preparing to engage, when he found himself surrounded and attacked on all sides. The Carthaginians thus had the Romans completely in their power, and took such advantage of the opportunity, that 16,000 Roman troops are said to have been either massacred or drowned in the lake, Flaminius himself being among the first who fell; 6000 troops who had forced their way through the enemy, surrendered next day to Maharbal. It is said both by Livy and Pliny that the fury on both sides was so great as to render the combatants unconscious of the shock of an earthquake which occurred during the battle.

TRAS-OS-MO'NTÉS (Beyond the Mountains), a province of Portugal, forming the north-east corner of the country, is bounded on the N. and E. by Spain, on the S. by the river Douro, and on the W. by the Portuguese province of Minho. Area, 4275 sq. m.; pop. (1878) 410,461. It is in the main a cold plateau, with bare mountain masses, broken through by deep romantic ravines; but the port-wine district, known as the *Alto-Douro*, is very pleasant. Considerable quantities of wheat and rye are raised, but the chief products are wine and oil. In several places the silkworm cultivation is prosecuted with success. Fruits, especially oranges, are produced abundantly in the valleys, and sumach on the mountains, which are also rich in unutilized metallic wealth.

TRASS, a tufaceous deposit of the extinct volcanoes of the Eifel, near Coblenz, resembling the Puzzolana of Naples. Its base consists almost entirely of pumice, in which are embedded fragments of basalt, burnt shale, slate, sandstone, &c., and even numerous trunks and branches of trees. Its formation is accounted for by supposing an eruption to have taken place, with copious evolution of gases, in a lake-basin, and a flood of the mud thus formed to have swept away whatever came before it. Large areas are covered by the T., which has choked up valleys, now partially re-excavated.

TRAVANCO'RE, a protected state in the extreme south of India, bounded on the E. by the states of Tinnevelli and Madura, and on the W. by the Indian Ocean. Area, 6730 sq. m.; pop. (1871) 2,311,379. At the southern extremity of the state is Cape Comorin (properly, Kumarin). On the elevations the soil is light and gravelly; in the valleys it is in general a deep black mould. Rice, the sago-palm, and vegetables are the principal products. Formerly, the capital was Travancore, a decayed and unimportant town; the present capital is the small town Trivanderam.

TRAVELERS, Law as to. In the United Kingdom, entire freedom of traveling is one of the rights of the subject. The rights of travelers in regard to the use of roads are stated under the head of highway (q. v.). Other rights are noticed in connection with Inn (q. v.). With regard to travelers by conveyances, whether by land or sea, if the party conveying is a public carrier, then the following are his liabilities. A public carrier having a stage-coach (and railway companies are on the same footing) does not engage or warrant to convey a traveler with absolute safety, as is the case with respect to goods, but merely to convey without negligence on his part; hence, if the conveyance meets with some accident, resulting in injury to the traveler, the right of the latter to recover damages depends on whether the carrier or railway company has been guilty of negligence. Considering that, in case of a dispute, it is always left to a jury to say whether there was negligence or not, it is a safe maxim, that there is scarcely anything in the form of an accident which is not resolvable by a jury into negligence on the part of the carrier or company; and an injured traveler has seldom much difficulty in throwing the burden on the carrier of proving that there was no negligence on his part,

and this proof, for the reasons stated, is seldom successful, at least where the accident arose from a defect in guiding the carriage.

In case of accidents not fatal, the party injured has almost always a remedy against the carrier, the chief dispute being as to the amount of damages, the amount legally demandable varying according to the position in life and injury to business caused by the accident. In case of death caused by blameable accident in traveling, there was formerly no remedy available to the executors or relatives, and there is none at the present day; but if the deceased party leave a wife, husband, parent, or child, then these, but no other relations, can sue for damages. In the case of a traveler's proceeding a great distance over several lines of railway, his remedy is entirely against the company with whom he contracted—that is to say, to whom he paid the lump sum, and from whom he obtained his ticket. A carrier may contract not merely to carry a traveler a certain distance by his own conveyance, but to carry him to any part of the world, using for that purpose various other intermediate railways or steamers for the rest of the journey; and in all such cases the only person with whom the traveler contracts is the carrier to whom he paid his fare, who is liable for any accident or negligence, whether occurring on his own part of the line, or on any other part.—As to traveler's luggage, see LUGGAGE.

TRAVELER'S TREE, or RAVENALA (*Urania speciosa*, or *Ravenala Madagascariensis*), a remarkable plant of the natural order *Musaceæ*, a native of Madagascar, and forming a characteristic feature of the scenery of many parts of that island. The stem resembles that of the plantain, but sends out leaves only on

Traveler's Tree (*Urania speciosa*).

two opposite sides, like a great expanded fan. The lower leaves drop off as the stem grows, and in an old tree the lowest leaves are sometimes thirty feet from the ground. A tree often has twenty or twenty-four leaves, the stalk of each leaf being six or eight feet long, and the blade four or six feet more. The blade of the leaf is oblong, bright green, and shining. The fruit is not succulent, but is filled with a fine silky fibre of the most brilliant blue or purple color, amongst which are about thirty or forty seeds. Forty or fifty fruits grow in a bunch, and three or four bunches may be seen at once on the tree. The leaves are much used for thatch, and for many other purposes; and the leaf-stalks for the partitions, and often even for the walls of houses. The leaf-stalks always contain water, even in the driest weather, more than a quart being readily obtained by piercing the thick part of the base of a leaf-stalk, and this water is pure and pleasant. Hence the name *Traveler's Tree*.

TRA'VEMÜNDE. See LUBECK.

TRA'VERSE, in Fortification, mounds of earth, above the height of a man, and 18 feet thick, placed at frequent intervals on a rampart, to stop shot which may enfilade the face of such rampart. A fire of this nature, in the absence of traverses, would dismount the guns, and prove altogether ruinous. The traverses also give means of disputing the progress of an assailant who has gained a footing on the wall, for each traverse becomes a defensible parapet, only to be taken by storm.

TRAVERSE, in the Law of England, means the denial of fact given by one party in an action to the pleading of his adversary.

TRAVERSING PLATFORM, an arrangement for the more rapid and easy movement of cannon in battery. The gun is either mounted on an ordinary truck-carriage, or on rollers under its trunnions. The truck or rollers work in and out on two parallel iron rails, which rails are mounted on the traversing carriage, and are 16 feet or more in length. Wheels at each end of this platform, or more frequently if the weight of the gun be very great, are placed at right angles to the direction of the rails, and run on circular tramways, which have their center in the embrasure through which the gun is fired. The rails incline upwards towards the rear, to moderate the gun's recoil. The advantages are, that the leverage for turning the gun is increased by the platform's length, while the circular rails diminish the resistance; that the gun is easily run out for firing on the upper rails; that by its own recoil it runs itself in again for loading; and that a much smaller embrasure is required to give a good compass to the muzzle.

TRA'VERTIN, the Italian name for limestone formed by springs holding lime in solution.

TRA'VESTY (Fr. *travestir*, to disguise, particularly through the effect of *contrast;* e. g., to dress in another sex's or person's clothes; Ital. *travestire*) is a term applied in literature to denote a burlesque representation of something previously executed in a serious and lofty manner. It differs from Parody (q. v.) in this respect, that while the latter changes the subject-matter and the *dramatis personæ*, but mockingly imitates the style of the original, the former leaves the subject-matter partially, and the *dramatis personæ* wholly, unaltered; producing a purely comic effect by the substitution of the mean, the frivolous, and the grotesque in action or speech, for the serious, the noble, or the heroic.

TRAVNIK, a town of Bosnia (now under Austrian administration), and recently its capital, stands on the Lasva River, 45 miles west-north-west of Bosna-Serai. Its numerous mosques and the castle, which dates from the middle ages, are the principal edifices. It contains 12.000 inhabitants, almost all Mohammedans. The principal branch of industry is the manufacture of sword-blades.

TRAW'LING, a mode of fishing by a net dragged along the bottom of the sea, behind a boat. It is much employed in deep-sea fishing on the coast of England, and by far the greater part of the fresh fish brought to the London market, herring and mackerel excepted, is now obtained by trawling. Trawling has long been practised on some parts of the south coast of England, but of late years this mode of fishing has been adopted much more extensively than before, and has been introduced where it was formerly unknown, particularly on the east coast of England, not without great opposition on the part of line-fishers and others, who have loudly complained of injury done by it to the fisheries by destruction of spawn, and otherwise. The Report of the

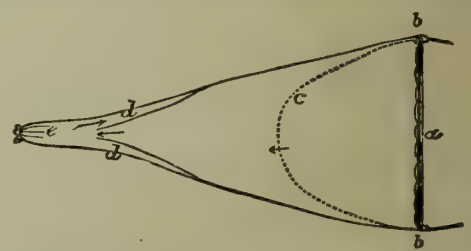


Fig. 1.—Beam-trawl Net:
a, beam; *b*, *b*, trawl-heads; *c*, outline of the ground rope; *d*, *d*, the pockets; *e*, the cod or small end of the net.

Commissioners on the Sea-fisheries of the United Kingdom, 1866, sets aside all complaints against it, however, as unfounded; whilst its great productiveness recommends it as advantageous to the public interest. The *Trawl*, or *Beam-trawl*, as it is often called, is a triangular purse-shaped net, about 70 feet long, usually having a breadth of about 40 feet at the mouth, and gradually diminishing to 4 or 5 feet at the commencement of the *cod*, or smaller end of the net, which is about 10 feet long, and of nearly uniform breadth. The upper part of the mouth is secured to a wooden beam about 40 feet long, which keeps the net open; this beam is supported on two upright iron frames, known as the *trawl-heads* or *irons*. The under side of the net corresponds with the upper, except that instead of being fastened to a beam, it is made with a deeply-curved margin attached to the *ground-rope*, the whole length of it in contact with the ground.

A trawl has also generally two *pockets*, one on each side, made by lacing together the upper and under parts, so that fish turning back from the cod may be caught in them. The meshes vary in size from four inches square at the mouth, to an inch and a quarter square in the cod. Two stout ropes, of about 15 fathoms each, are fastened, one to the front of each of the trawl-heads, the other ends united to form a bridle, to which is shackled a warp 150 fathoms long. By this warp the trawl is towed, the

quantity of rope paid out depending on depth of water, weather, and other conditions. Trawling is generally in the direction of the tide, sometimes across it, but never against it. The rate of progress is usually only from half a mile to two miles an hour faster than that of the stream. The trawl can only be used with advantage on a sandy bottom or other smooth ground. On rough ground, the net would be torn in pieces. The vessels employed in trawling on the Dogger Bank and elsewhere near the English coast vary in size from 35 to 60 tons. Many of these trawlers, however, stay out at sea for six weeks at a time in all seasons of the year; their fish being packed in ice collected by fast-sailing cutters, and so conveyed to market. Cod, haddock, and other *white-fish* are caught in great numbers by trawling; and some kinds of flat-fish, as soles, are scarcely to be obtained by any other means. Smaller trawl-nets than those above described are used in bays and estuaries.

A kind of trawl called the *pole-trawl* was formerly in use in some parts of England, but is now used only in the south of Ireland.

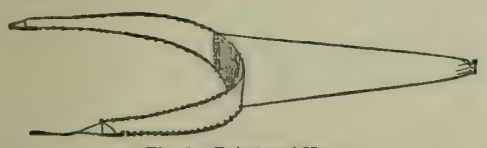

Fig. 9.—Pole-trawl Net.

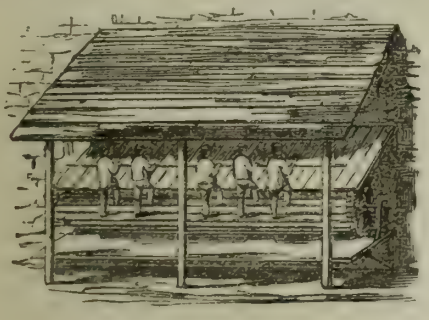
It is much less effective than the beam-trawl. Instead of a beam, two poles of 25—30 feet long are used, rigged out on the sides of the vessel, to keep the mouth of the net open.

The term trawling is commonly, although incorrectly, employed in Scotland to designate a particular mode of herring-fishing, which, however, is only seine-net fishing (see NETS) on the principle of encircling shoals of fish, as has been practised in pilchard-fishing on the south coast of England from time immemorial. It is of recent introduction in Scotland, and has been opposed by the drift-net herring-fishers, from interested motives, in the same way that beam-trawling has been opposed on many parts of the English coast. The legislature too hastily accepted the views of its opponents; but a Royal Commission having been appointed to inquire into the subject, made a report decidedly favorable to it in 1863; and the judgment of that Commission was sustained by the Report of the Sea-fisheries Commission of the United Kingdom in 1866.

TREACLE. See SUGAR.

TREAD-MILL, an appliance of prison discipline, much in use some years ago in the prisons of Great Britain, the invention of Sir William Cubit, of Ipswich. It consists of a wheel in the form of a long cylinder, furnished with 24 steps round its circumference, and turned on its axis by the tread of prisoners, each of whom may be made to tread in a separate compartment, so boarded off that he can have no intercourse with the rest. The prisoners are assisted and supported by a hand-rail, and cause the wheel to revolve about twice in the minute. The tread-mill has



Tread-mill.

sometimes been made productive by being used to grind corn or turn machinery. It has been found an objection to its use, that it does not admit of being modified to meet the varying strength of individual prisoners; and as an instrument of prison discipline it has been generally supplanted by the *Crank*, a small flaked wheel, like the paddle-wheel of a steamer, which, on the prisoner turning a handle outside, revolves within a box partially filled with gravel. The amount of strength necessary to each revolution can be regulated by the quantity of gravel used, and a register placed outside the prisoner's cell records the number of revolutions made. The crank is only used when hard-labor is part of the prisoner's sentence.

TREASON (Fr. *trahison*, Lat. *traditio*, from *tradere*, to give up or betray), in the Law of the United Kingdom, is the highest civil crime which a member of the community can commit, being treachery against the sovereign. By the ancient common law of England, there was great latitude as to what was held by the judges to be treason, whereby, says Blackstone (b. iv. c. vi.), the creatures of tyrannical princes had opportunity to create abundance of constructive treasons, that is, to raise, by forced and arbitrary constructions, offences into the crime and punishment of treason, which never were suspected to be such. Thus, the accroaching, or attempting to exercise royal power—a very uncertain charge—has been treated as treason; and killing the kings's father or brother, or even his messenger, has also been so treated. The inconvenience of these constructive treasons led to the passing of the statute of 25 Ed. III. c. 2, which attempted to define treason, and it was defined in five forms. 1. When a man compasses or imagines the death of the king, queen, or their eldest son and heir. Under this clause it was held that the husband of a queen-regnant was not included; but it includes a king *de facto*, without regard to his title. The phrase 'compassing and imagining the death of a king,' has given rise to much discussion, but it has been taken to mean the mere purpose or design, as distinguished from the carrying such design into effect; nevertheless, the purpose can only be proved by some overt acts, such as providing weapons or ammunition for the purpose of killing the king, assembling and consulting on the means to kill the king, &c. The law has often, however, been strained, and in arbitrary reigns, even a sermon unpreached was held to convict Peachum; and a paper found in a closet to convict Algernon Sydney, though merely speculative in its character. 2. Another form of treason is the violation of the king's companion (i. e., wife), or his eldest daughter unmarried, or the wife of the king's eldest son and heir. 3. Another form is that of levying war against the king in his realm, either by taking arms to dethrone the king, or under pretence to reform religion or the laws; by resisting the king's forces; by joining an insurrection, with an avowed design to pull down all enclosures, all brothels, and the like; though such a conspiracy, if aimed at a particular house, would be only a riot. 4. It is also treason to adhere to the king's enemies in the realm by giving them aid and comfort, as by sending intelligence or provisions, or selling arms. 5. Lastly, it is treason to slay the chancellor, treasurer, or the king's justices of the bench, or in assize, while in their places administering justice. Besides these specific forms of treason, the statute of Edward III. enacted that, if there should be other cases not above specified, the judge should tarry without going to judgment, till the king and parliament should judge it treason or other felony—which was a safeguard against the judges indulging too much in refinements about constructive treason. At a later period, between the reigns of Henry IV. and Queen Mary, the courts returned to the system of inventing constructive treasons, and actually included as such the clipping of money, burning houses to extort money, refusing to abjure the pope, &c. These and other new-fangled treasons were totally abolished by a statute of 1 Ed. VI. c. 12. By a subsequent statute of 1 Anne c. 17, whoever endeavors to hinder the next in the succession under the Act of Settlement, from succeeding to the crown, is to be held guilty of treason; and whoever maliciously affirms another to have right to the crown, otherwise than according to the Act of Settlement, commits treason. Moreover, by 36 Geo. III. c. 7, whoever compasses or intends death or bodily harm to the person of the king, is to be adjudged a traitor. One of the characteristics of an indictment for treason is, that a copy of the indictment, and a list of the witnesses and jurors, must be delivered to the prisoner. This information, which gives the names, and also the places of abode, of all the witnesses, must be delivered to the prisoner ten days before the trial; and the prisoner is entitled to have counsel assigned to defend him. This right, which prisoners accused of other crimes have not in English law, was conferred by a statute of Will. III.

The punishment of treason was severe and even revolting. The traitor was to be drawn on a hurdle to the place of execution, hanged by the neck, his head then severed from the body, the body divided into four quarters; and the head and quarters to be at the disposal of the crown. But in 1870 these barbarities were repealed, and the sentence is now changed into hanging. The consequence of a conviction of treason was forfeiture and corruption of blood; the corruption of blood having the effect that the attainted person could neither inherit lands from his ancestor, nor transmit them to any heir. But this was altered as regards England and Ireland in 1870 by the statute 33 and 34 Vict. c. 23. The convict forfeits and is disqualified for any public office; the court may order him to pay the costs of his conviction, and his whole property is transferred to administrators named by the crown, who administer it and retransfer the surplus to his heirs and representatives.

There are certain minor offences which are called misprision of treason, being those closely bordering on treason. Such are offences which consist in the bare knowledge and concealment of treason, without any degree of assent thereto, for any assent makes the party a principal traitor. If a person, knowing of the

treason, do not forthwith reveal it to some judge of assize or justice of the peace, this is the crime of misprision of treason. The punishment of misprision of treason was loss of goods and lands during life. Another offence closely related to treason is the wilfully pointing a gun at, or attempting to strike, the person of the sovereign, with intent to injure him (or her); the offence being recently reduced, by statue 5 and 6 Vict. c. 51, to one punishable with three years' imprisonment. There is also a cognate offence created by 11 and 12 Vict. c. 12—that of intending to depose the queen, or levying war against her in order to intimidate her or the Houses of Parliament. The offence of Præmunire (q. v.) was originally the introducing a foreign power into the country, and the name was extended to similar offences. The law of treason in England and Scotland is nearly the same.

TREA'SURER, LORD HIGH, the name given to the third great officer of the crown in England, who, in former times, was sole head of the king's exchequer. In the reign of William I. a separate board and court for matters of revenue was appointed after the model of the Exchequer of Normandy, and a treasurer and other officers were appointed for transacting business relating to the royal revenue. Odo, Earl of Kent, was the earliest holder of this office; but the early treasurers were for the most part churchmen. The functions of the treasurer were often discharged by the Chief Justiciary, and the offices of Justiciary and Treasurer seem not to have been completely separated till the reign of Stephen. The office of Lord High Treasurer was for the first time put into commission by James I. in 1612; and from the accession of George I. down to the present time, it has been the practice to vest the office in a Board of Lords Commissioners of the Treasury. See TREASURY. In Scotland, a similar office existed prior to the Union; and there were also Lords High Treasurers appointed in Ireland. On the Union of 1707, the Lord High Treasurer of England became the Lord High Treasurer of Great Britain; and in 1816, by statute 56 Geo. III. c. 98, on the consolidation of the same offices in England and Ireland, he was constituted the Lord High Treasurer of the United Kingdom.

TREASURER OF THE HOUSEHOLD, an officer in the Lord Steward's department of the royal household of the United Kingdom, who bears a white staff, and ranks next to the Lord Steward, for whom he is empowered to act in his absence. He is always a member of the Privy Council; and his tenure of office is dependent on that of the ministry. In former days, this office was hereditary, but it has long ceased to be so.

TREASURE-TROVE is the finding of hidden treasure in the earth; the word treasure meaning coin, gold or silver plate, or bullion. By the law of England, he who finds such things hidden in the earth is not entitled to them, but they belong to the crown. This is an exception to the general rule, that he who first finds a thing, whose owner is unknown, is entitled to keep it; and accordingly the exception is construed strictly, so that if the coin, &c., is not hidden in and covered by the earth, the finder, and not the crown, is entitled to it. If it is treasure-trove in the strict sense above described, then it is the duty of the finder to give notice to the crown; and to conceal it or appropriate it is an indictable offence, punishable by fine and imprisonment.—In Scotland, the rule is the same, and the finder is bound to inform the sheriff of the finding. It is not so generally known as it ought to be that the crown is in the practice of paying to the finder the value of the property, on its being delivered up; from misapprehension of this matter it is believed that many curious relics are lost by their finders consigning them to the melting-pot.

TREASURY, that department of the executive of the government of the United Kingdom which has the control of the revenue and expenditure of the country. The head of the Treasury was in former times an officer called the Lord High Treasurer (see TREASURER, LORD HIGH), but his office has ever since the accession of George I. been executed by Lords Commissioners, who have become his permanent representatives. The Treasury Board now consists of the Prime Minister (generally styled First Lord of the Treasury), the Chancellor of the Exchequer, and three junior Lords of the Treasury, who have usually seats in parliament, as have also the two joint-secretaries of the Treasury. The First Lord being the head of the administration, his duties are not limited to the Treasury, which is chiefly conducted by the other members of the Board. The Chancellor of the Exchequer, who holds under a distinct patent the office of Under-treasurer, is the effective head of the Treasury, exercising the most responsible control over the expenditure of the different branches of the service, as also over all works demanding unusual outlay in the naval, military, and civil departments, either at home or in the colonies. He prepares an annual estimate of the expenses of the country, and of the ways and means by which they are proposed to be met; and this statement, known as the Budget, is submitted by him to the House of Commons. The Prime Minister, when a member of the House of Commons, has occasionally held at the same time the office of Chancellor of the Exchequer. The duties of the junior Lords are in a great measure formal: the heaviest portion of the executive functions of the Treasury devolves on the Secretaries.

The function of payment has ever since the Restoration been completely separated from the custody of the public revenue, the former only being vested in the Treasury, while the latter belongs to the Exchequer. By an arrangement effected by 4 and 5 Will. IV. c. 15, the revenue flowing into the Treasury is paid into the Bank of England, to the credit of the Comptroller-general of the Exchequer, and all payments on the public account are made pursuant to a warrant or order of the Treasury. No moneys voted by parliament can be drawn from the Exchequer without the warrant of the Treasury Board, nor can any payment be made from the civil list without its authority.

The duties of the Treasury Board are numerous. The supplies for the army, navy, and civil service are issued under its authority. In virtue of various statutes, it has the regulation of the salaries of newly created officers in other departments, and of the number of officers in the establishments for new branches of the public service. The duties of the Treasury also comprise the examination of the expenses of legal establishments, sheriffs, county courts, and criminal prosecutions. All payments for civil salaries, allowances, and incidental charges payable in England, and all payments for the army, navy, and ordnance, are made upon the special authority of the Treasury by the Paymaster-general. The Boards of Customs and Inland Revenue, and the Post-office, are subject to its general authority. The office of Woods and Forests now discharges many of the duties which formerly developed on the Treasury, but is subject to its regulations. The establishments of colonial and other offices are also subject to the control of the Treasury with regard to their expenses. The Treasury may be appealed to against the decisions of subordinate departments in all cases connected with the receipt of revenue.

The Treasury possesses the patronage of the departments immediately subordinate to it. The church patronage of the crown —except that which belongs to the Lord Chancellor—is usually disposed of on the advice of the First Lord of the Treasury; and the Foreign and Colonial Secretaries, in all important appointments falling under their patronage, are in the practice of consulting the First Lord of the Treasury.

TREATY, in public Law, an agreement of friendship, alliance, commerce, or navigation, entered into between two or more independent states. Treaties have been divided by publicists into *personal* and *real*, the difference being that the former relate exclusively to the persons of the contracting parties, for example, treaties guaranteeing the throne to a particular sovereign and his family, and the latter are treaties for national objects, independent of the rulers of the state. While personal treaties expire with the death of the sovereign, or the extinction of his family, real treaties bind the contracting parties independently of any change in the sovereignty of the states. The constitution of each particular state must be looked to, to determine in whom the power of negotiating and contracting treaties with foreign powers resides. In monarchies, whether absolute or constitutional, it is usually vested in the sovereign. By the constitution of Great Britain, the exercise of this power is subject to parliamentary censure: ministers who advise the conclusion of any treaty which shall afterwards be judged derogatory to the honor, or disadvantageous to the welfare of the nation, being liable to impeachment, a proceeding of which English history affords numerous instances; as the impeachment of De la Pole, Earl of Suffolk, in 1451, for making a convention of peace without the assent of the privy council; of Wolsey, in 1529, by the House of Lords, for making treaties without the king's knowledge; and of the Earl of Orford by the Commons, in 1701, for advising treaties for dividing the dominions of Spain.

In republics, the chief magistrate, senate, or executive council is intrusted with the exercise of this sovereign power. The constitution of the United States of America (art. ii. sec. 2) vests it in the president, with the advice and consent of the senate. No special form of words is necessary for the validity of a treaty; but modern usage requires that an agreement which has originally been verbal, should as soon as possible be committed to writing. There are certain compacts between nations which are included in the exercise of a general implied power confided to certain public agents as incidental to their official position. Such are the acts of generals or admirals limiting hostilities by truces, capitulations, or cartels for the exchange of prisoners, which do not require the ratification of the supreme authority, unless there be a reservation making that necessary. In other cases, however, a public minister or other diplomatic agent is not entitled to conclude or sign a treaty with the foreign power to which he is accredited, without a full power independent of his general letter of credence. Even in the case of a treaty concluded with full powers, it is often considered expedient to have a special ratification by the sovereign, or other proper authority of the state contracting.

A treaty is considered to be extinguished when one of the contracting powers loses its existence as an independent state, when the internal constitution of either state is changed so as to make it inapplicable; and in case of war between the contracting parties, unless the stipulations of the treaty have been expressly with a view to the rupture. As there is often a difficulty in distinguishing stipulations perpetual in their nature, from those that are extinguished by war, it is common to insert clauses in treaties of peace reviving and confirming the treaties formerly subsisting between the contracting parties.

A Treaty of Guaranty is an engagement by which one state promises to aid another when it is disturbed, or threatened to be disturbed, in the peaceable enjoyment of its rights by a third power.

Treaties of alliance may be offensive or defensive: in the former, the ally engages generally to co-operate in hostilities against a specified power, or against any power with which the other may be at war; in the latter, the engagements of the ally extend only to a war of aggression commenced against the other contracting party.

The execution of a treaty is occasionally secured by hostages; as at the peace of Aix-la-Chapelle, in 1748, when several peers were sent to Paris as hostages for the restoration of Cape Breton by Great Britain to France.

TRE'BBIA, a small but famous stream of Italy, rises in the Ligurian Appennines, near Montebruno, flows northward through a mountain valley for the greater part of its course, and joins the Po, two miles west of Piacenza. Its entire length is about 50 miles. Here Hannibal decisively defeated the Roman consul Sempronius, 218 B.C.

TRE'BIZOND, or TREBISOND (in Turkish, *Tarabezún*), is a Turkish eyalet in the nort-east of Asia Minor, stretching along the south-east shore of the Black Sea for 240 miles, with an estimated pop. of 540,000. The surface is mostly mountainous, the slopes towards the sea being thickly wooded. The eastern portion of the eyalet is known as Lazistan, from its inhabitants, the Lazi, a savage vindictive race, distinguished among their neighbors for their barbarous manners and predatory habits. The port of Batoum and a part of Lazistan on the Russian frontier were ceded to Russia in 1878. Next to Trebizond, the most important places in T. are Samsoun, Kerasun, and Gumish-Khaneh.

The chief town of the eyalet is TREBIZOND, a flourishing seaport city, on the Black Sea coast, about 110 miles north-west of Erzerum. It is surrounded by walls of great extent, which enclose numerous gardens as well as the town itself, and is inhabited by a pop. of 40,000—50,000, chiefly Moslems. Outside the walls are various suburbs, where most of the Christian inhabitants reside, and in which the principal bazaars and khans have been established. The city is defended by several forts along the walls, and by a fortified citadel perched upon a high rock on one side of the town. It possesses an excellent harbor, which, however, is only considered safe during the summer months, the roadstead of Platena, seven miles to the west, being employed for the rest of the year. There are numerous mosques and 'medresses,' ten churches for Greek Christians, copper foundries, dye-works, &c. The geographical position of T. is, in a commercial point of view, rivaled only by that of Alexandria, and has made it the great entrepôt of the commerce between Eastern Europe and Central Asia, and the second commercial city of the Turkish Empire. European goods are brought hither, since 1836, by regular services of steamers, from Constantinople and the mouths of the Danube; and those of Asia by caravans from Erzerum, Tabriz, and Syria. The value of the annual imports by sea is about £1,500,000; that of the annual exports may amount to a little over £1,000,000. The inland traffic with Anatolia is supposed also to represent a value of near £1,000,000. The goods brought overland embrace silk, wool, tobacco, wax, gall-nuts, oil, opium, drugs of various kinds, honey, timber, carpets, and shawls; and those arriving by sea are principally cotton cloths, glass, cutlery, fire-arms, as well as grain, iron, tin, spices, &c.

T. is the ancient *Trapezus*, and was founded by a colony from Sinope; it was a flourishing town under the Colchians, when Xenophon arrived there in his famous retreat from Persia. Conquered from Mithridates by the Romans, it rapidly rose in importance, became a free city, was made by Trajan the capital of Pontus Cappadocicus; and, by the same enlightened ruler, was provided with a larger and better harbor. On the capture of Constantinople by the Crusaders in 1204, and the expulsion of the Comnenian emperors, one of the imperial family, Alexis, established himself at T., where he had previously exercised the functions of governor, and founded a state known as the *Empire of Trebizond*, which stretched from the Phasis to the Halys, and maintained its independence against the Turks till 1462, when the last emperor was defeated and captured by Sultan Mohammed II.

TREBLE, the highest part in harmonized music, which in general contains the melody, and is sung by a Soprano (q. v.) voice. The treble or G clef is placed on the second line of the staff, indicating that the note G occupies the line encircled by its lower-curve. It is one of the two clefs in use in music for keyed instruments.

TRE'DEGAR, a market-town on the north-west border of Monmouthshire, 18 miles north-west of Newport. It stands in the midst of a district with extensive iron-works and coal-mines, which give employment to the great mass of the inhabitants. Pop. in 1871, 12,389.

TREDGOLD, THOMAS, a celebrated English authority on architecture and engineering, was born at Brandon, a small village 2½ miles south-west of Durham, 22d August 1788. At the age of 14 he was apprenticed for six years to a cabinetmaker; but devoted his leisure time to the study of the principles of architecture, and kindred subjects. In 1808, he went to Scotland, where he worked as a journeyman carpenter for five years; then removed to London to his relative Mr. Atkinson, the architect to the Ordnance Board, with whom he labored till 1823, by which period his private business had increased so much that he commenced business on his own account as a civil engineer. During the ten years of T.'s residence with Mr. Atkinson, he studied with redoubled zeal, and obtained a thorough acquaintance with mathematics, chemistry, mineralogy, and geology. He died from pure exhaustion of nature, 28th January 1829, at the early age of 40. T.'s scientific contributions to periodicals range over a wide field; but his great and valuable works are *The Elementary Principles of Carpentry, a Treatise on the Pressure of Beams and Timber Frames, the Resistance of Timber, the Construction of Floors, Roofs, Centers, and Bridges* (4to, 1820; 2d ed., 1828); and the *Strength of Cast Iron* (1821; 2d ed., 1824; 3d ed., 1831). His other works, the *Principles of Warming and Ventilating Public Buildings*, &c. (1824); *Practical Treatise on Railroads and Carriages* (1825); a pamphlet entitled *Remarks on Steam-navigation*, &c. (1825); and *The Steam-engine* (1827), were also received with special favor; and of the first and last of them new editions were speedily required.

TREE, the name given to those plants which live for many years, and have woody stems and branches, the stem being generally single, and bearing a head of branches and twigs; whereas Shrubs (q. v.) have generally a number of stems springing from one root. The terms tree and shrub are not, however, of very exactly defined signification; and many shrubs, under certain circumstances, assume the form of trees, either naturally or by the help of art; whilst trees are, in other circumstances, converted into shrubs. The common hawthorn, for example, is very often a mere shrub, but sometimes appears as a tree, with stem and head as perfect as the greatest monarch of the forest. The gooseberry bush is usually trained in our gardens in a tree-like habit, notwithstanding its small size, and the shortness of its stem; this, however, is entirely artificial, its natural habit being that of a shrub, to which, but for the gardener's knife, it would almost certainly relapse in a single year. The greater number of tress are exogenous. Palms are almost the only endogenous plants to which this name can be given. Very different from the ordinary exogenous trees are the Gymnogens (q. v.) of Lindley—firs, pines, yews, &c. Trees are found in all climates except the coldest, but the number of species, as well as the luxuriance of the forests, is greatest in the tropics. As we advance towards the polar regions, or ascend high mountains, trees disappear before other forms of vegetation. The different characters of trees affect very much the landscape of the countries in which they grow; some countries, and particularly in northern parts of the world, being covered with somber pine forests, whilst others abound in ash, beech, and similar trees of verdant foliage. Every kind of tree has its peculiar character, not only in its foliage, but in its general form and its mode of branching. An ash is as easily distinguished from an elm, by a practised eye, in winter, when destitute of leaves, as in the full foliage of summer.

Some trees attain a very great age, but the ordinary duration of life is very different in different species. There are trees in England which are supposed to be more than a thousand years old, and are still healthful and flourishing. Oaks and yews are amongst the trees of longest life. The Baobab of Africa is also regarded as a very long-lived tree. See EUCALYPTUS, WELLINGTONIA.

No acotyledonous plant assumes the character of a tree, except a few ferns, known as Tree Ferns.

TREE FERNS are ferns with tree-like woody stem, and a head of fronds resembling the leaves of palms. They are found only in tropical and sub-tropical countries, many of which, however, are quite destitute of them. One species, *Alsophila gigantea*, which has a thick black trunk surmounted by a feathery crown, is found in the Himalaya, at an elevation of 7000 feet, and might be introduced with some probability of success into Britain. The

soft central part of the stem of *Cyathea medullaris* is an article of food in New Zealand. Tree Ferns are a characteristic feature of the vegetation of New Zealand.

Tree Fern.

TREE-FROGS (*Hyladæ*), a family of *Batrachia* (q. v.), separated from the true frogs (*Ranidæ*) on account of the dilated discs or suckers at the tips of the toes, which are covered with a viscid secretion, and enable the animals to climb trees. Most of them are arboreal; they are of small size, more elegant in form than the true frogs, of brighter colors and more active habits. They feed on insects, which they pursue on the branches and among the leaves of trees or shrubs, stealing towards them, and suddenly springing upon them. They deposit their spawn in water, like other batrachians—some of them on the edges of leaves hanging over water—and hybernate in mud. The day is their time of activity, although they shelter themselves among leaves from very hot sunshine. Their croaking is louder than

Tree-frog (*Hyla arborea*).

th. of true frogs, and the traveler is sometimes amused by hearing it from the tops of high trees. No species of tree-frog is found in Britain; one occurs in the middle and south of Europe; it is also found in Asia and the north of Africa; the warmer regions of the Old World have numerous species, and in America they are still more abundant. Some occur in Australia. The TREE-FROG of Europe (*Hyla arborea*)—*Rainette* of the French—is found chiefly in moist woods, and in hedges near water. Although a small creature—one of the smallest of European frogs—it can make a spring of more than a yard in height to seize an insect. It becomes very noisy on the approach of rain, and is often kept in confinement, to serve as a kind of barometer. Very similar to it is the COMMON TREE-FROG of North America (*H. versicolor*), which is abundant in the middle and northern parts of the United States as far west as the Mississippi, but is replaced in the south by the GREEN TREE-FROG (*H. viridis*), whilst other species are found in different parts of the country.

TREES OF LIBERTY. The custom, common to almost all the nations of Europe, of celebrating the beginning of spring and various national and ecclesiastical festivals by setting up green boughs, led, during the war of independence in the United States, to the habit of planting poplars and other trees as the symbol of growing freedom. This example was imitated during the French Revolution. The Jacobins in Paris are said to have planted the first tree of liberty in 1790; and the custom spread rapidly through the whole of France. These trees, crowned with the cap of liberty, were soon to be found in every village, while the people danced round them, singing revolutionary songs, and regarded them as the rendezvous of the patriots. Poplars were at first employed, but afterwards oaks were substituted in their place. This custom was regulated by a decree of the Convention, and diffused over foreign countries by the republican armies. During the Reign of Terror, thousands lost their lives under the pretext of having injured a tree of liberty. During the Empire, this custom, like all others that had originated during the Republic, was completely suppressed. In the July revolution of 1830, trees of liberty were again set up, particularly at Paris; but the populace took no interest in the matter. During the February revolution of 1848, trees of liberty once more came into vogue at Paris and other places where the inhabitants held republican principles. They were generally hung with tri-colored ribbons, circles, and triangles, the symbols of unity and equality, and surmounted with the cap of liberty. In Paris, on the occasion of erecting a tree of liberty, a priest was frequently conveyed to the spot for the purpose of consecrating it. After most of the trees of liberty had fallen during the conflicts in the streets of Paris in June 1848, government issued an order for their removal from all places where they impeded traffic. Before the end of the year, they had entirely disappeared. Numerous trees of liberty were erected in Italy during the revolution of 1848 and 1849, but fell as the different insurrections were quelled. A learned and interesting treatise has been written on this subject by the Abbé Grégoire.

TRE'FOIL, a name given to many herbaceous plants with leaves of three leaflets, as Clover (q. v.), Lotus (q. v.), Medick (q. v.), Buckbean (q. v.), &c.

TREFOIL, in Heraldry, is a frequent charge, representing the clover-leaf, and is always depicted as *slipped*, i. e., furnished with a stalk.

Trefoil in Heraldry.

Trefoil in Architecture.

TREFOIL, in Architecture, a three-lobed aperture in tracery, &c.

TREGELLES, SAMUEL, LL.D., an eminent New Testament critic and editor, was born at Falmouth in 1813. He did not receive a university education, and spent the early part of his life in secular occupation, yet at the age of twenty-five he had formed the plan of a Greek New Testament, on the principles which he afterwards carried out. In preparing for his *magnum opus*, he visited the continent in search of MSS., and published, among other works, an edition of the *Codex Zacynthius*, an *Account of the Printed Text of the Greek New Testament* (1854) and an *Introduction to the Textual Criticism of the New Testament* (1856). His *Critical Edition of the Greek New Testament* was published in 1856—72, and stands, as to manner of treatment, between that of Lachmann and that of Tischendorf. T. goes further than Tischendorf in his dependence upon ancient, and rejection of modern MSS. In 1862, T. received a pension of £100, which was doubled in 1870. He died on the 24th of April 1875.

TRE'LLIS, an open grating or lattice-work, formed in wood, iron, &c.

TREMATO'DA, or TREMATODE WORMS, constitute, according to Dr. Cobbold's system, the second order of the sub-class *Sterelmintha* (Owen), of the class *Helmintha*. In ordinary zoological classification, the T. form a division of the group of *Platyelmia* or 'flat-worms,' which group is in its turn included in the class *Scolecida*—a division of *Vermes* (see ZOOLOGY). This order, as the Greek word *Trematodes* indicates, is characterized by the possession of certain suctorial pores or openings. All the animals included in it have soft, roundish, or flat bodies, and their visceral organs are lodged in the parenchyma of the body. Most of the T. are hermaphrodites. They seldom attain to a large size (the greatest length is about five inches), but are usually visible to the naked eye. Like all Scolecida, the T. possess a peculiar system of vessels ramifying through their bodies, and termed the 'water-vascular' system.

The Trematoda, or flukes, as they are popularly called, from their resemblance in form to small flukes or flounders, are not parasitic during the whole period of their existence; 'for while passing through the cycle of their life-development, they frequently change their residence, at times inhabiting either open

waters, or the dewy moisture of low pasture-grounds. They perform active and passive migrations from parasitic to non-parasitic abodes; and during their larval wanderings in search of a final resting-place which should prove suitable to their adult condition, they provisionally occupy the bodies of different kinds of invertebrata.'—Cobbold's *Entozoa*, 1864, p. 15. In his *Synopsis of the Distomidæ* (published in 1861), Dr. Cobbold recognizes 344 species of flukes, of which 126 belong to fishes, 47 to reptiles, 108 to birds, 58 to mammals, and 5 to the invertebrata. He now believes that, at the very lowest possible estimate, we must assume the order to contain 400 species, which may be divided into the five families of *Monostomidæ*, *Distomidæ*, *Tristomidæ*, *Polystomidæ*, and *Gyrodactylæ*—names which are based, except in the last case, on the number of their pores or oval suckers.

Van Beneden arranges these families into (*a*) *Monogenea* and (*b*) *Digenea*, the development in the former being simple, while in the latter there is an alternation of generation, the nurses and larvæ living chiefly in molluscs, while the adult animals chiefly live in the bodies of vertebrate animals. The *Monostomidæ* and *Distomidæ* belong to the latter, and the others to the former group. The family of *Distomidæ* embraces the principal and best-known genera of the order *Trematoda*, and its members are at once recognized by the presence of two pores or suckers; one, the anterior, being connected with the mouth; and the other, termed the acetabulum, being usually placed on the ventral surface, in the middle line.

The following members of this order are of special interest, as very liable to infest man. *Fasciola hepatica*, described and figured in the article FLUKE, is not only common in all varieties of grazing-cattle, and especially the sheep, but has been found in the horse and ass, in the hare and rabbit, in the squirrel, beaver, kangaroo, &c., and is occasionally met with in man, not only in the liver and gall-bladder, but beneath the skin in various parts, as, for example, in the sole of the foot, behind the ear, and in the scalp. For an excellent account of the anatomy and development of this parasite, the reader is referred to Cobbold, *op cit.*, pp. 147—169. See ROT. *Distoma lanceolatum* is a species which is by no means uncommon in the sheep and ox, and has been found on at least three occasions in the human subject. *Distoma ophthalmobium* has been occasionally found in the lens of the human eye. *Distoma hæmatobium*, or *Bilharzia hæmatobia*, as Dr. Cobbold terms it, is the only known trematode which is not hermaphroditic.

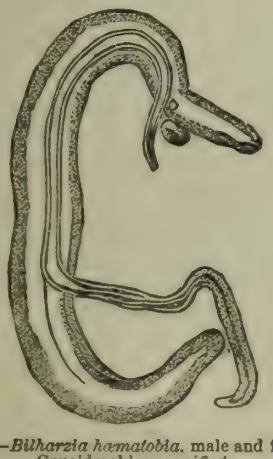


Fig 1.—*Bilharzia hæmatobia*, male and female: Considerably magnified.

The male is a cylindrical worm, measuring only about half an inch in length; while the female is filiform, longer, and much

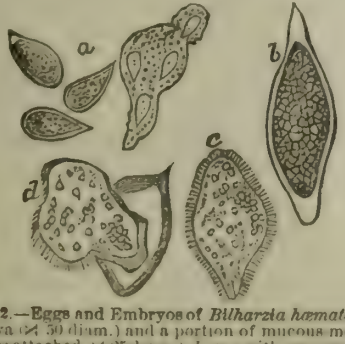

Fig. 2.—Eggs and Embryos of *Bilharzia hæmatobia*: *a*, three ova (× 50 diam.) and a portion of mucous membrane with eggs attached (× 25 diam.); *b*, egg with segmented yelk; *c*, free embryo; *d*, ruptured egg with embryo escaping (× 150 diam.).—From Dr. John Harley.

narrower than the male, being about $\frac{4}{5}$ths of an inch in length. The first specimens were found by Bilharz of Cairo in the portal system, and the worm has since been found in the veins of the mesentery, bladder, and other parts. This parasite is common not only along the borders of the Nile, but in South Africa and the Mauritius. It is so common in Egypt, that in 363 examinations of the body after death, Griesinger found it no less than 117 times.

The principal feature of the disease caused by this worm consists in a general disturbance of the uropoietic function. Diarrhœa and hæmaturia occur in advanced stages of the complaint, being also frequently associated with the so-called Egyptian chlorosis, colicky pains, anæmia, and great prostration of the vital powers. The true source of the disorder, however, is easily overlooked, unless a careful microscopical examination be made of the urine and other evacuations. If blood be mixed with these, and there also be a large escape of mucus, a minute inspection of the excreta will scarcely fail to reveal the presence of the characteristic ova of *Bilharzia*.—Cobbold, *op. cit.*, p. 202.

Dr. J. Harley has published several excellent papers 'On the Hæmaturia of the Cape of Good Hope, produced by a Distòma,' which is undoubtedly the *Bilharzia*.

Several other trematodes occasionally occur in the human subject.

TRE'MELLA, a genus of Fungi, of the division *Hymenomycetes*, soft and gelatinous, of no very determinate form, mostly growing on decaying wood. Several species are found in Britain. In some places, they receive such popular names as Witches' Meat and Witches' Butter. Superstitious notions have been connected with them, and a medicinal value altogether imaginary has been ascribed to them.

TRE'MOLITE, a mineral regarded as a variety of Hornblende (q. v.). It is composed of silica, magnesia, lime, and a very little fluoric acid.

TRE'MOLO, TREMA'NDO (Ital. trembling), in Music, an expression indicating that a note or a chord is to be reiterated with great rapidity for an indefinite number of times, so as to produce a tremulous sort of effect. In singing, *tremolo* effects may on rare occasions be introduced with advantage, but are often resorted to by inferior singers as an artifice to conceal defects of tone and style.

TRE'NAILS, pieces of wood which are used as nails in shipbuilding. They are usually about 15 or 18 inches in length, and when completed, at least 1 inch in thickness. They are made chiefly of locust-wood (*Robinia pseudo-acacia*), or of oak; the former are imported from North America, the latter from Northern Europe. Great Britain imports of these small pieces of wood as much as £5000 worth annually.

TRENCH. See SIEGE.

TRENCH, RICHARD CHENEVIX, Archbishop of Dublin, divine and scholar of the Church of England, belongs to an Anglo-Irish family of Galway, the Trenches of Woodlawn, and was born at Dublin, 9th September 1807. He was educated at Harrow and Trinity College, Cambridge, where he graduated in 1829. After traveling for a few years, he became a country curate; and in 1837 or 1838, published two volumes of poetry, which had at least the merit of imitating Wordsworth, and were favorably received. One of the poems, the *Story of Justin Martyr*, is even yet faintly remembered. In 1845, T. was presented to the rectory of Itchin Stoke; in 1847, he became Theological Professor and Examiner in King's College, London; in 1856, Dean of Westminster; and in 1864, on the death of Whately, Archbishop of Dublin. T. has written extensively and well. He has a quick, keen understanding; his scholarship is varied and choice, though not sufficiently precise or scientific for philological purposes; his fancy, sometimes poetic, and always picturesque, enables him to invest the dry discussion of words with a peculiar fascination; and if the results of his etymological inquiries are not always sure, the processes are invariably pleasant.

As a literary critic, T. is both acute and elegant. His principal works are: *Notes on the Miracles* (1846), *Notes on the Parables* (1841; 12th ed. 1874), *The Lessons in Proverbs* (1853), from all of which his professional brethren have borrowed liberally for the work of the pulpit; *The Sermon on the Mount illustrated from St. Augustine* (1844), *Sacred Latin Poetry* (1849), *St. Augustine as an Interpreter of Scripture* (1851), *Synonymes of the New Testament* (1854), *The Epistles to the Seven Churches of Asia Minor*, *An Essay on the Life and Genius of Calderon*, *Deficiencies in our English Dictionaries*, *Glossary of English Words used in Different Senses* (1859), *The Study of Words* (1851), of which last 22 editions appeared in America before 1862; a memoir of his mother (1862); and *Lectures on Mediæval Church History* (1878).

TRENCK, FRANZ and FREDERICK VON DER, were German barons and soldiers, whose adventures, recorded in autobiographies, have secured for them a world-wide fame. They were cousins, descended from an ancient house of East Prussia, and although placed from infancy under circumstances altogether differ-

ent, exhibited a striking similarity of character. Both were braggarts, both were subject to fits of uncontrollable passion, and both told premeditated lies.

BARON FRANZ was born in Reggio, in Calabria, on 1st January 1711, where his father was an Austrian general. When 17, he received a commission as a cavalry officer, fought duels, and cut off the head of a man who refused to lend him money. He had to flee in consequence, and he went to Russia, where he was made a captain of hussars. He was then a formidable young giant of 6 feet 3 inches; and it is highly probable that he knocked down his commanding officer, as he says he did, for rebuking him. He adds that he was placed under arrest while an engagement was going on; that Marshal Münnich happening to pass, he called out that if set free and pardoned he would bring back three Turks' heads in an hour; that he was set free, and brought back four Turks' heads suspended from his saddle. This story may or may not be true; but certain it is that he was cashiered not long afterwards, and returned to settle on his estates in Croatia. There it is we first meet with the T. of history. The Turkish frontier was overrun with banditti. T. armed and drilled 1000 of his tenants, whom he called Pandours, and by their means succeeded in restoring order. He then offered the services of his regiment to Maria Theresa, and his aid was accepted. In 1740, he took part in the Silesian war at the head of his men, and perpetrated the most atrocious deeds of rapine and cruelty. There had been no such monster, says Mr. Carlyle, since Attila and Genghis. On the 7th of September 1742, he attacked Cham, a fine trading town in neutral territory, this act being, of course, in defiance of all law and discipline; and he completely annihilated it.

After the battle of Sohr, in September, 1745, he offered to capture Frederick the Great, and bring him a prisoner to the Austrian camp. He failed in the enterprise, with great loss of men, but he secured the king's tent and much valuable booty. Suspicions were, however, entertained of his being in communication with the enemy, and he was tried by court martial. He was imprisoned at Vienna, but made his escape with the assistance of the Baroness Lestock, who bribed the jailers to allow him to be conveyed in a coffin as if dead, beyond the city walls, was again captured at Bruges, and reimprisoned at Grätz, where he took poison, and died on 4th October, 1747.—See Carlyle's *Life of Frederick the Great;* and *Mémoires du Baron Franz de Trenck* (Par. 1787), written by himself.

FREDERICK VON DER T. was born at Königsberg, in 1726, and was the son of a major-general in the Prussian service. He distinguished himself at the university. At 16, he became a cornet in the guards; and two years afterwards, the Princess Amalie, who saw him at a ball, we are told, conceived a violent passion for him. To this he attributed the antipathy the king afterwards entertained towards him. There was, however, a much better reason: he was detected in a correspondence with his Austrian cousin, not long before the attempt to capture the king, and arrested. Mr. Carlyle shows that the baron had been in prison three months, and was there when the battle of Sohr took place, although he vividly describes his own adventures in the fight. He was accused of this lie in his own time, and admitted that he must have made a mistake! 'He had nothing but his poor agitated memory to trust to.' He was released on 24th December, 1763, and afterwards settled at Aix-la-Chapelle, where he married the burgomaster's daughter, and went into business as a wine merchant. He published his memoirs in 1787. The book was translated into all languages, and T. became the most famous personage of his time.

The ladies at Paris, Berlin, and Vienna wore bonnets, dresses, and rings *à la Trenck;* and no less than seven plays, founded on his adventures, were brought out on the French stage. In 1792, he went to Paris, and became a zealous adherent of the Mountain party. He was, however, suspected, and thrown into prison. Soon after rumors in circulation among the prisoners, that the Prussians were advancing on Paris, and carrying all before them, were traced to T., who was in consequence condemned. He was guillotined near the Barrière du Trône, July 26, 1794. On the scaffold, although 69 years of age, he manifested the ungovernable passion which had characterized him through life. He harangued the mob; and at length the executioner had by force to hold his head by the gray hair on the block, to meet the fatal stroke.—See Chambers's *Book of Days*, vol. i. p. 260; Carlyle's *Frederick the Great*, vol. iv.; *Friedrich Trencks Merkwürdige Lebensgeschichte von ihm selbst beschrieben* (2 vols. Berl. 1787); and *Leben und Thäten der Trenke*, by Watermann (2 vols., Leip. 1837.)

TRENT, a river of the midland counties of England, rises on the north-west border of Staffordshire, about 10 miles north of Burslem, and at a height of about 600 feet about sea-level. It flows first south-east to the border of Derbyshire, and afterwards in a general north-east direction through the counties of Derby, Nottingham, and Lincoln, to a point about 8 miles east of the town of Goole, where it unites with the Ouse (q. v.) to form the Humber (q. v.). It receives the Derwent, Idle, and Tarn from the west, and the Soar from the south; its length is 170 miles, for 120 miles of which, from its mouth up to Burton-on-Trent, it is navigable for barges.

TRENT (Ital. *Trento*, Ger. *Trient*, Lat. *Tridentum*), a walled town of Austria, in the southern part of the Tyrol, capital of the circle of the same name, is situated on the left bank of the Adige (here spanned by a wooden bridge 146 feet long), in a beautiful and fertile valley, surrounded by high limestone hills, 46 miles north of Verona. In its general aspect, as well as its architecture, T. is quite an Italian town; and with its spires and towers, ruined castles and ancient embattled walls, it presents an imposing appearance from a distance. The *Piazza Grande*, near the Cathedral is adorned with a splendid fountain of red marble, surmounted by a colossal statue of Neptune with his trident. The cathedral, begun in 1212, is a beautiful specimen of the Romanesque style of Lombardy, with a few features suggestive of the contemporary German style; united to it is a fragment of the episcopal palace of the 12th century. The Church of Santa Maria Maggiore is built on the site of the council-chamber in which the famous 'Council of Trent' held its sittings. Among other public buildings are the Church of the Jesuits, ornamented with the richest foreign marble; the New Theater (holding 1400 people); the town-hall; and the Palazzo Buonconsiglio adjoining the town, a noble specimen of the feudal architecture of North Italy, now occupied as a barrack. T. carries on manufactures of silks, wine, pottery, spirits, cloth, and sugar, and has a large transit-trade. The inhabitants are quite Italian in language and habits; and the restoration to Italy of T. and the *Trentino* (district of T.) is, with that of Trieste, the chief aim of the *Italia Irredenta* agitation in Italy. Pop. (1880) 19.585.

The ancient *Tridentum*, or *Tridente*, derived its name from the *Tridentini*, an Alpine tribe, whose capital it was. Conrad the Salic bestowed on the prince-bishops of T. the temporal rule of the valley of the Adige, and under them T. rose to great prosperity. It is still the see of a prince-bishop.

TRENT, COUNCIL OF, the most celebrated of the assemblies regarded by the Roman Catholic Church as ecumenical or general, and the great repository of all the doctrinal judgments of that communion on the chief points at issue with the reformers of the 16th century. Very early in his conflict with Pope Leo X., Luther had appealed from the pope to a general council; and after the failure of the first attempts at an adjustment of the controversies, a general desire grew up in the church for the convocation of a general council, in which the true sense of the church upon the controversies which had been raised might be finally and decretorially settled. Another, and, to many, a still more pressing motive for desiring a council, was the wish to bring about the reform of the alleged abuses as well of the court of Rome as of the domestic discipline and government of local churches, to which the movement of the reformers was in part at least ascribed. But the measures for convoking a council were long delayed, owing partly, it has been alleged, to the intrigues of the party who were interested in the maintenance of those profitable abuses, and especially of the officials of the Roman court, including the cardinals, and even the popes themselves; but partly also to the jealousies, and even the actual conflicts, which took place between Charles V. and the king of France, whose joint action was absolutely indispensable to the success of any ecclesiastical assembly. It was not till the pontificate of Paul III. (1534—1549) that the design assumed a practical character.

One of the great difficulties regarded the place of meeting. In these discussions, much time was lost; and without entering into detail, it will suffice to say that the assembly did not actually meet till December 13, 1545, when 4 archbishops, 22 bishops, 5 generals of orders, and the representatives of the emperor and the king of the Romans, assembled at Trent, a city of the Tyrol. The number of prelates afterwards increased. The pope was represented by three legates, who presided in his name—Cardinals del Monte, Cervino, and Pole. The first three sessions were devoted to preliminaries. It was not till the fourth session (April 1546) that the really important work of the council began. It was decided, after much disputation, that the doctrinal questions and the questions of reformation should both be proceeded with simultaneously. Accordingly, the discussions on both subjects were continued through the fourth, fifth, sixth, and seventh sessions, in all which matters of great moment were decided; when a division between the pope and the emperor, who, by the victory of Mühlberg, had become all-powerful in the empire, made the former desirous to transfer the council to some place beyond the reach of Charles's arbitrary dictation. The appearance of the plague at Trent furnished a ground for removal, and in the eighth session a decree was passed (March 11, 1547) transferring the council to Bologna.

This translation was opposed by the bishops who were in the imperial interest, and the division which ensued had the effect of

suspending all practical action. Meanwhile, Paul III. died. Julius III., who had, as Cardinal del Monte, presided as legate in the council, took measures for its resumption at Trent, where it again assembled May 1, 1551. The sessions 9—12, held partly at Bologna, partly at Trent, were spent in discussions regarding the suspension and removal; but in the 13th session the real work of the assembly was renewed, and was continued, slowly, but with great care, till the 16th session, when, on account of the apprehended insecurity of Trent, the passes of the Tyrol having fallen into the hands of Maurice of Saxony, the sittings were again suspended for two years.

But the suspension was destined to continue for no less than nine years. Julius III. died in 1555, and was followed rapidly to the grave by his successor (who had also been his fellow-legate in the council as Cardinal Cervino), Marcellus II. The pontificate of Paul IV. (1555—1559) was a very troubled one, as well on account of internal difficulties as owing to the abdication of Charles V.; nor was it till the accession of Pius IV. (1559—1565) that the Fathers were again brought together to the number of 102, under the presidency of Cardinal Gonzaga, re-opening their deliberations with the 17th session. All the succeeding sessions were devoted to matters of the highest importance—communion under one kind; the sacrifice of the mass; the sacrament of orders, and the nature and origin of the grades of the hierarchy; marriage, and the many questions connected therewith. These grave discussions occupied the sessions 17—24, and lasted till November 11, 1563. Much anxiety was expressed on the part of many bishops to draw the council to a conclusion, in order that they might be enabled to return to their sees in a time so critical; and accordingly, as the preliminary discussions regarding most of the remaining questions had already taken place, decrees were prepared in special congregations comprising almost all the remaining subjects of controversy, as purgatory, invocation of saints, images, relics, and indulgences. Several other matters, rather of detail than of doctrinal principle, were referred to the pope, to be by him examined and arranged; and on the 3d and 4th of December 1563, these important decrees were finally read, approved, and subscribed by the members of the assembly, consisting of 4 cardinal legates, 2 other cardinals, 25 archbishops, 168 bishops, 7 abbots, 7 generals of orders, and 39 proxies of bishops—making in all 252.

These decrees were confirmed, January 10, 1564, by Pius IV., who had drawn up, based upon them in conjunction with the creeds previously in use, a profession of faith known under his name. See ROMAN CATHOLIC CHURCH. The doctrinal decrees of the council were received at once throughout the Western Church, a fact which it is necessary to note, as the question as to the reception of the decrees of doctrine has sometimes been confounded with that regarding the decrees of reformation or discipline. As to the latter, delays and reservations took place. The first country to receive the decrees of the council as a whole was the Republic of Venice. France accepted the disciplinary decrees only piecemeal and at intervals.

It would be out of place here to enter into the question as to the merits of this unquestionably great and momentous assembly, which may be said to have practically decided the religious destinies of the Western Church. It is viewed with directly opposite impressions by opposing critics, and it is commonly even said that in the Catholic Church itself the Council of Trent has met its worst adversary in the person of one of the priests of its own creed, the Servite monk, Fra Paolo Sarpi. It must be confessed, however, that the most candid of modern inquirers have shown that Sarpi cannot fairly be regarded as a Roman Catholic. His sympathies are all strongly anti-Roman, and there are abundant indications in his work of a rationalizing tendency, which plainly ought to rank him among the partisans of that free inquiry which it has been the object of Trent to repress by judgment, pronounced once for all, and excluding all controversy. See SARPI. And although there are perhaps equal exceptions against the impartiality of his rival historian and antagonist, Pallavicino, the latter is admitted by Ranke, Raumer, and others to be far more reliable in the use of documents than his Servite adversary.

The canons and decrees of the Council of Trent were issued in Latin, and have been reprinted innumerable times. They have also been translated into almost every modern language; the most approved English translation being that of the Rev. Jeremiah O'Donovan. One of the supplementary works assigned to the pope by the council at its breaking up was the completion of a catechism for the use of parish priests and preachers. This work has not all the authority of the council, but it is of the very highest credit, and is extensively used, having, like the canons and decrees, been very generally translated. Another similar work was the publication of an authentic edition of the Vulgate version of the Bible, as well as of the Missal and Breviary. All these have been accomplished at intervals; and there is besides at Rome a permanent tribunal, a congregation of cardinals, styled Congregatio Interpres Concilii Tridentini, to which belongs the duty of dealing with all questions which arise as to the meaning, the authority, or the effect of the canons and decrees of this celebrated council. See SARPI, PIUS IV., PALLAVICINO.

TRE'NTON, the capital city of New Jersey, U. S., on the left bank of the Delaware River, at the confluence of Assunpink Creek, and head of steam-navigation, 30 miles north-east of Philadelphia, and 57 south-west of New York; a well-built and handsome city, with a fine view of the river. It contains the state Capitol; state lunatic asylum, for 600 patients; state normal school; penitentiary, with 350 inmates; state library, of 20,600 vols.; 34 churches; 6 daily newspapers; extensive railway connections; and manufactories of locomotives, machinery, cannon, rifles, wire, wire-cordage, crockery, terra-cotta, cotton, woollen, paper, &c. In the war of the Revolution, T. was the scene (Dec. 25, 1776) of a night-attack by Washington upon the British troops—chiefly Hessians—whom he surprised by crossing the Delaware, then thought impassable by reason of the floating ice. Pop. (1870) 22,874; (1880) 29,910.

TRENTON FALLS, a village of New York, U. S., on West Canada Creek, 15 miles north-west of Utica, celebrated for its beautiful cascades (6 in number), with an aggregate fall of 312 feet, in a deep ravine, 2 miles long, with walls of rock in places 150 feet high.

TREPA'N. See TREPHINE.

TREPA'NG. See BECHE-DE-MER.

TREPHI'NE AND TREPHINING. (The instrument in its original form was called a *trepan*, from Gr. *trupao*, allied to Lat. *tereo*, to bore; the now usual form is called a *trephine*.) The operation of trephining consists in the perforation of a bone by means of a trephine, which is a small cylindrical or circular saw, with a center-pin on which it works. It is practised on the skull in cases of fracture: '1st, when a portion of the bone is depressed, and encroaches on the cavity of the skull, producing compression of the brain, and the fragment cannot otherwise be raised; 2dly, for punctured fractures by which the inner table is splintered, separated from the outer table, and lying loose on the dura mater; and 3dly, for effusion of blood, or of inflammatory products, between the bones and membranes, or between the latter and the brain, when it is presumed that the effused fluid may be evacuated by the opening.' —Holmes's *System of Surgery*, vol. iv. p. 1044. It has likewise been employed in epilepsy, with the view of removing an assumed local cause of disturbance; but it is not likely to be ever again used in that disease, as it is now an established axiom, that as the operation itself may destroy life, its application is not justifiable, except as the last resource of surgery in extreme cases.

Trephine.

Attempts have been made by various surgical instrument makers to regulate the action of the trephine by means of a movable collar, so as to prevent the brain from being injured after the skull has been perforated. For the method of applying the instrument, we may refer to any work on Operative Surgery.

TRE'SPASS as a legal term in the Law of England, means any wrong or injury committed upon either the person or property of an individual, not amounting to a crime. As regards a trespass to the person, the more familiar term is an assault or imprisonment; but trespass as to goods and chattels is more commonly known under the names of the remedies applied, as, for example, actions of Trover (q. v.), Detinue (q. v.). Trespass is the technical as well as popular name for that kind of injury which is done to a man's land or house by intruding into it against his will. In English law, the maxim is well known, that every man's house is his castle, and he is entitled to treat as an enemy any person who attempts to enter without his leave. There are, however, a few exceptions to this rule of the inviolability of a man's house, for it is no protection against the officers of the law when executing criminal process—for example, coming to apprehend a person charged with crime. But, as regards mere civil warrants, the officers of the law have no right to break open a man's outer door in order to effect an arrest for debt; and no civil court can give the bailiff such a power. The consequence is, that the bailiff can only wait outside or endeavor by some stratagem to get inside the house in a peaceable manner; and if once inside the outer door, he can then break his way through the house, in order to find his debtor. Such is the law as to intruding into a man's house armed with the authority of the law.

It is a general rule applicable to a man's house as well as land, that if a stranger enter without leave, and do not quit at the request of the owner (who is not bound to state any reason for his request), the owner may by force eject the intruder. In doing so, however, he must not use more force than is necessary to over-

come the resistance offered. If the intruder enter with force, the owner may turn him out without even first requesting him to depart; but if the intruder enter quietly, he must first be requested to leave before hands can be put upon him. If, in turning a stranger out, the stranger assault the owner, then the latter may defend himself; but a policeman cannot interfere, or rather it is not compulsory upon him to interfere, unless he sees an assault committed by the intruder. Sometimes it is erroneously believed that a person is entitled to go to another's house on lawful business, and insist on admission, and even to remain till he get an answer—such as a creditor to demand his money; but this is not so. A creditor may be ordered away, and has no more right to intrude than any stranger. It is also sometimes erroneously supposed that any member of the public is entitled to enter into certain public places, such as a shop or a theater; but this is not so. Any shopkeeper can turn any person he pleases, at any moment, out of his shop, and is not bound to deal with any person except he chooses. So with a keeper of a theater or other place commonly described as public places. There is an exception, however, as to an Innkeeper (q. v.), who is bound, if he have accommodation and the means, to admit a traveler requiring refreshment. As to all other places, the general rule is, that whoever is the occupier of a house, or of land, is exclusively entitled to possession, and can extrude any person who refuses on request to leave; or if he prefer to resort to his legal remedy, he can sue such intruder in an action of damages. The amount of damages recovered will depend greatly on the circumstances attending the trespass, and whether insult or outrage was an accompaniment.

It is often erroneously believed by the public, as well as by some landlords or occupiers, and it is probably a wholesome delusion, that it is a criminal offence for a stranger to trespass upon lands, and that such stranger can be given into custody for doing so; and to keep up this impression, it is common for landlords or occupiers to stick up a notice with the words: 'Trespassers will be prosecuted.' But the fact of such a notice, or of there being a fence to the land, does not make any difference with regard to the trespasser, who is just as much liable to an action of damages, but to nothing else, for the trespass, whether he knew or not of such notice; and in neither case can he be given into custody, as if for a criminal offence. If, however, a trespasser were to break the trees, or do wilful damage (other than mere walking or riding) he may be liable to be apprehended; and if he is at the time trespassing with intent to catch or kill game, he may in some cases be apprehended and given into custody. See GAME, POACHING. It is a defect in the law that owners of land have no summary remedy except physical force to turn out or keep off trespassers, and that justices of the peace have no power to impose a moderate fine upon trespassers for repeating acts of trespass after notice that the owner or occupier dislikes them.

Not only human beings are trespassers, but the word is also by analogy applied to the trespasses of dogs, cats, and other animals. The trespasses of cattle are often of importance, in consequence of the damage done by them. The rule of law which governs the rights of occupiers of land on that subject is the following. An owner is not bound to fence his land, and whether fenced or unfenced, a neighbor is bound neither to trespass himself nor allow his cattle to trespass. If, therefore, A's cattle trespass on B's land, B can impound them; that is, he can lock them up, and keep possession till the owner pay for the damage done; or, if he prefer it, he can bring an action to recover the damages; or, he may drive them off, and also bring the action, until by one or other remedy he is satisfied. With regard to dogs, cats, and similar domesticated animals, the rule is, that the owner is merely responsible for such mischief as they commit by reason of some negligence on his part. If, for example, he knows of some bad propensity they have to stray and attack or damage third persons, then it becomes his duty to take such means as will prevent their doing the mischief; but he cannot be held responsible unless and until the animals have on a former occasion done the mischief—in other words, it is only for a second and not a first offence that he can be made liable. There is one exception only to this rule, recently created by statute, viz., where dogs trespass and worry sheep; in that case, by a recent change made in the law of the United Kingdom, the owner of the dog is to pay for the damage, though he was not aware of any propensity in the dog to do such mischief.

In order to guard against trespass both of men and animals, the owners of land have sometimes resorted to spring-guns and man-traps, planted in their grounds. This practice was carried to a great height in England, as well as Scotland, about forty years ago. It was decided by the courts in England that there was nothing to prevent an owner from so protecting his land; but to put a limit to it, a statute was passed which restricted such right to dwelling-houses and gardens; so that now in England, it is illegal to place man-traps and spring-guns in open fields. As regards, however, traps to catch dogs, cats, or other animals, an owner of land is entitled to place these in his lands, and even to allure the animals with bait, so as to invite them to their doom; but this must not be done so close to a highway as to tempt a dog aside which is lawfully passing along the highway, for the owner of a dog being entitled to the use of the highway for the dog as well as himself, is entitled to have no danger placed in its way, such as a strong-smelling bait, which should operate irresistibly on its animal instincts. It is, therefore only in the open fields or woods not adjoining the highway, that these dog or cat traps can be lawfully placed for protection of game or otherwise—In Scotland, the law is substantially the same as regards trespass as it is in England or Ireland; but it was held illegal at common law in Scotland to put man-traps in lands by way of protection: and it is still illegal to do so. In Scotland, also, there is a more summary remedy against trespassers than exists in England, for an interdict may be obtained to prevent mere trespassers, irrespective of the game or fishery laws; and even justices of the peace may deal summarily with mere trespassers.

TRE'SSURE, in Heraldry, a subordinary, generally said to be half the breadth of the orle, and usually borne double, and flowered and counter-flowered with fleurs-de-lis. It forms part of the royal insignia of Scotland, which are: or, a lion rampant gules, armed and langued azure, within a double tressure flory counterflory of the second. The origin of the tressure in the arms of Scotland has been traced by the older heralds to the 9th c., when they relate that it was granted by Charlemagne to King Achaius of Scotland, in token of an ancient alliance between France and Scotland, and with the view of indicating that the French lilies would in time coming be a defence to the Scottish lion. Chalmers insinuates that these two monarchs were probably not aware of each other's existence; and, in point of fact, the double tressure is not known to have been borne earlier than the time of Alexander III., on whose seal it appears. The tressure is, however, held in great honor in Scottish heraldry, and Lyon King-of-Arms has not been permitted to grant it to any subject without a royal warrant; as a mark of especial favor, it has, however, occasionally been accorded by the sovereign to the representatives of important families directly descended by a maternal ancestor from royalty, or who had deserved well of their king and country.

TREVE'LYAN EXPERIMENT (so called from the person who first carefully studied the phenomenon). When a block of iron or copper is considerably heated, and laid on a block of cold lead, a sound of some intensity, and more or less musical, is often heard. Trevelyan, after many trials, adopted for the 'rocker,' as it is called, a form somewhat resembling a fire-shovel, with a thickish block of metal instead of the blade. This is poised delicately on the lead block, so as to bear with nearly equal pressure on two points separated by a groove; and the rounded end of the handle is also supported. The annexed fig. shows a section of the head of the rocker and of the lead block. The rocker being heated, supposed it poised so as to touch the lead at A only. It heats the lead at A, and therefore suddenly expands it near that point, since lead is a bad conductor of heat. Thus, the lead, as it were, swells up at A, and tilts the rocker over to B. There the same process takes place, and so on; and as the rocker thus moves alternately from A to B, the successive impacts, occurring at nearly equal intervals, form a musical sound. This can be altered at pleasure by loading the rocker, or by altering its moment of inertia. By proper care, almost any conducting body may be made thus to rock upon another, though, in the majority of combinations, the effect is very slight. The explanation of the phenomenon, as given above, is due to Faraday.

TRÈVES (Ger. *Trier*, Lat. *Augusta Trevirorum*), a town of Rhenish Prussia (pop. in 1871, 21,442; in 1880, with suburbs, 37,431), capital of a circle, lies on the right bank of the Moselle, in a lovely valley, between vine-covered hills, about 65 miles south-west of Coblenz. The river is here crossed by a bridge of 8 arches, 730 feet long, and 25 broad. T. is a decayed place, and covers an area large in proportion to its population, owing to the number and size of the open spaces where houses once stood. The cathedral of St. Peter and St. Helen is a very interesting structure of various antiquity, principally of the early German Romanesque style of the 11th c., but retaining considerable remains in the interior of a previously existing Roman church of the age of Constantine. It has beautiful altars and tombs; rich old chasubles and missals; famous relics, among others the 'Holy Coat' (q. v.). Adjoining the cathedral is the *Liebfrauen-kirche*, a very graceful specimen of Early German Gothic architecture, finished in 1243. The only other ecclesiastical buildings of interest now remaining, are the chapel of the Benedictine convent of St. Mathias outside the town, and the church of the Jesuits. T. contains some beautiful old dwelling-houses of Romanesque architecture. No place in Germany is so rich in remains of the

Roman period. Among these are the *Porta Nigra*, a colossal gateway, probably one of the five gates by which T. was entered in Constantine's time, the so-called Roman baths (more probably part of an imperial palace), and a basilica built of Roman brick by Constantine for a court of justice, which, after being successively the residence of the Frankish kings and archbishops, was in a great measure demolished to make room for an electoral palace erected in 1614; this has recently been removed, and the basilica restored and fitted up as a Protestant church. Beyond the walls are the ruins of an amphitheater. The piers of the already mentioned bridge, consisting of enormous blocks of lava, are also of the Roman period.

T. is the seat of a bishop, and of a provincial council, has a chamber of commerce, a priestly seminary, gymnasium, a library of 96,000 vols. and numerous MSS., a museum full of valuable antiquities—including the famous *Codex Aureus*, or MS. of the Gospels in gold letters, presented to the Abbey of St. Maximin by Ada, sister of Charlemagne—and various benevolent institutions; and it carries on manufactures of woollens, cottons, and linens, besides a brisk trade in corn, timber, and Moselle wines.

T. derives its name from the *Treviri* or *Treveri*, a Gallic, or, more probably, a Belgic people, who inhabited, in Cæsar's time, a large tract of country between the Meuse and the Rhine. Their capital, *Augusta Trevirorum*, probably became a Roman colony in the time of Augustus, and ultimately became the head-quarters of the Roman commanders on the Rhine, and a frequent residence of the emperors, particularly of Constantine. Under the Franks, into whose hands it fell 463 A.D., it continued to flourish. In 843, it passed to Lorraine; in 870, to Germany; in 895, back to Lorraine; and finally was united to Germany by the Emperor Henry I. The Archbishop of T. was, in virtue of his office of Chancellor of Burgundy, one of the electors of the Empire, a right which seems to have originated in the 12th or 13th c., and continued till the French Revolution. The ambition and talents of some of these episcopal rulers obtained for them great political weight in Germany. Since 1814, T. has belonged to Prussia.—See Haupt, *T.'s Vergangenheit und Gegenwart* (2 vols., Trier, 1822); Steiniger, *Geschichte der Trevirer unter der Herrschaft der Römer* (Trier, 1845); and Braun, *T. und seine Alterthümer* (Trier, 1854).

TREVI'SO, a town of Italy, capital of the province of the same name, on the river Sile, in a very fertile country, 17 miles north of Venice. It is the seat of a bishop, and has a handsome and but recently finished Duomo, with five cupolas, and having an altar-piece of the Annunciation by Titian; and among the other buildings are the old Gothic church of San Nicolo (with a number of excellent pictures), the public library (30,000 vols.), and a fine theater. The town is surrounded by a wall of from 24 to 38 feet in height, and strengthened by numerous bastions. Manufactures of hardware are carried on; there are also a sugar refinery, a bell-foundry, and a number of paper-mills. Pop. of town (1881) 18,301.

TREVOR, Sir John, Knight, born in 1633. In the parliament of James II. which met on 19th May 1685, he was elected Speaker of the House of Commons. 'Trevor,' says Macaulay, 'had been bred half a pettifogger, and half a gambler, had brought to political life sentiments and principles worthy of both his callings, had become a parasite of the Chief Justice' (Jeffreys), 'and could on occasion imitate not unsuccessfully the vituperative style of his patron. The minion of Jeffrys was, as might have been expected, preferred by James, was proposed by Middleton, and was chosen without opposition.'—*History of England*, vol. i. p. 508 (ed. 1849). In the same year, he was made Master of the Rolls. He contrived to maintain his political and judicial position after the revolution of 1688, and was again elected Speaker on the meeting of parliament on 20th March 1690, on an understanding with the government that he was to take the management of what may fairly be called the bribery department. At the same time, he acted as first commissioner of the Court of Chancery, in which position his integrity seems from the first to have been greatly suspected; and though he was deficient neither in learning nor in parts, his judgments were both long in being given, and contemptible when they were pronounced.

For some years he maintained both his power and position; but his greed and venality at length became so notorious that respectable gentlemen of all shades of political opinion were ashamed to see him in the chair. In March 1695, a Committee of the House of Commons was appointed to investigate into the truth of certain charges of bribery brought against their Speaker. Within a week, the Committee reported, that in the preceding session, Sir John T. had received 1000 guineas from the city of London for expediting a local bill. As soon as the report had been read in the House, it was moved that the Speaker had been guilty of a high crime and misdemeanor. He had himself to stand up and put the question. There was a loud cry of 'Aye.' He called on the 'Noes.' Scarcely a voice was heard. He was forced to declare that the 'Ayes' had it. Even his 'callous heart and brazen forehead' were unable to stand the unspeakable ignominy of his position. Had he returned to the House on the following day, he would have had to put the question on a motion for his own expulsion; he pleaded illness, and shut himself up in his bedroom. A few days afterwards, he was formally expelled. He still, however, retained the Mastership of the Rolls, 'to the great encouragement,' says North, 'of prudent bribery for ever after.' 'His profligacy and insolence united,' says Macaulay, 'had been too much even for the angelic temper of Tillotson, who had been heard to mutter something about a knave as the Speaker passed him.' There are anecdotes of him in Noble's continuation of Granger's *Biographical History*, vol. i. p. 172. He died 20th May 1717, and was buried in the Rolls' Chapel.

TRI'ADS (in Chemistry). Until recently, the terms *equivalent number* and *atomic weight* were usually regarded by chemists as synonymous. Many recent writers, amongst whom Laurent (see his *Chemical Method*, translated by the Cavendish Society) stands pre-eminent, have, however, shown that there is an essential difference between them: and this difference is fully recognized by Professor Miller, who, in the latest edition of his *Chemical Physics*, 1863, thus defines it: 'The equivalent or combining proportion is an experimental constant which is independent of theoretical considerations; but the relative atomic weight is necessarily a matter of inference, and may be a number, often a multiple of the equivalent, and selected by the chemist from theoretical considerations, which, being based partly upon the law of gaseous volumes, partly on chemical grounds, partly on the phenomena of specific heat, seem to require that the atomic weights of a large number of the elements, if compared with the atomic weight of hydrogen, should be double of those commonly given.'—P. 22. Most chemists of the modern school now agree in arranging the elementary bodies in four groups; namely, 1. *Monad* or *Uniequivalent* Elements (or *Monads*), one atom of which in combination is equivalent to H_1, or one atom of hydrogen. In these, the atomic and equivalent numbers are identical. They are twelve in number, and include hydrogen, chlorine, bromine, iodine, silver, &c. 2. *Dyad* or *Biequivalent* Elements (or *Dyads*), each atom of which, in combining with other bodies, is equivalent to H_2, or two atoms of hydrogen. In these, the atomic number is double the equivalent number. This group embraces twenty-five elements, including oxygen, sulphur, selenium, iron, zinc, &c. 3. *Triad* or *Terequivalent* Elements (or *Triads*), each atom of which, in combining with other bodies, is equivalent to H_3, or three atoms of Hydrogen. In this group, which embraces nine elements, including nitrogen, phosphorus, arsenic, &c., the atomic and equivalent numbers are regarded as identical, except in the case of aluminium and rhodium, when the atomic number is doubled. 4. *Tetrad* or *Quadrequivalent* Elements (*Tetrads*), each of which, in combining with other bodies, represents H_4, or four atoms of hydrogen. Their atomic number is double the equivalent number. They are eight in number, including carbon, silicon, tin, &c.

This arrangement of the chemical elements, which is being adopted in all the most recent text-books, has led to the insertion of what are termed *dashed symbols*, in which the number of dashes which are attached to the symbol for the atom of an element indicates its equivalency or interchangeable value for hydrogen. Thus, Ag is marked with a single dash, to show that silver is a monad, or, in other words, that the atom of silver may be substituted for an atom of hydrogen, so as to combine with an atom of chlorine, the resulting compound being Ag′Cl (Chloride of silver); Cu is marked with two, Bi with three, and Si with four dashes, to indicate that they are dyads, triads, and tetrads respectively, or that the atoms of copper, bismuth, and silicon may be substituted for two, three, and four atoms respectively of hydrogen, so as to combine with two, three, and four atoms of chlorine, forming $Cu''Cl_2$ (chloride of copper), $Bi'''Cl_3$ (chloride of bismuth), and $Si''''Cl_4$, or $Si^{(iv)}Cl_4$ (chloride of silicon). These dashed symbols are rapidly coming into general use.

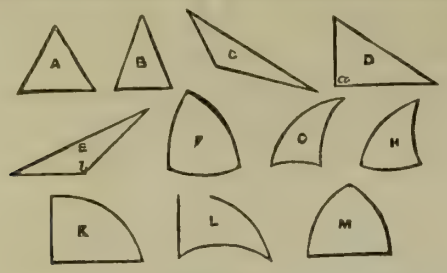
TRIAL, as a Legal term, applies most frequently to trial by Jury (q. v.), whether in a civil or criminal matter. See Prosecutor.

TRIAL AT BAR is a jury trial which takes place before the full court of four judges, instead of one judge only. It is seldom resorted to, and leave must be given in each case on special grounds.

TRI'ANGLE (*tres*, three, *angulus*, a corner), the most simple of geometrical figures, is a figure having three angles; but, oddly enough, it is generally defined by geometers as a figure of three sides, and its property of being three-angled is put in the subordinate position of a necessary consequence. It may be that this arises from Euclid's use of the word *tripleuron* (three-sided) in the definitions *prefixed* to his *Elements;* while *trigonon* (three-angled) is employed in the work itself.

In plane geometry, a triangle is bounded by three straight lines;

and triangles are classed according to the relative length of their sides, into *equilateral* (A), or equal-sided; *isosceles* (B), or having two sides equal; and *scalene* (C), or unequal-sided, the equality or inequality of the sides carrying with it the equality or similar in-



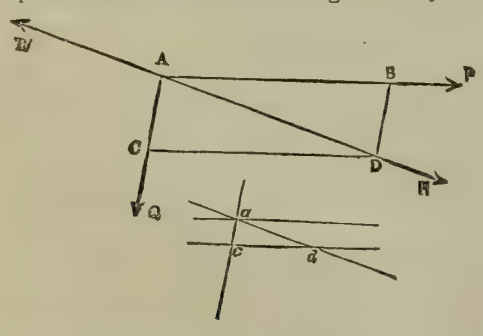
Triangles.

equality (of *greater* or *less*) of the angles respectively opposite to these sides, though the *ratio* of inequality of the sides by no means corresponds to that of the angles. Considered with reference to the size of its angles, a triangle is *right-angled* (D) when one of its angles (*a*) is a right angle (90°); *obtuse-angled* (E), when it has one angle (*b*) greater than a right angle; and *acute-angled* (A or B), when it has no angle so great as a right angle; the well-known property, that the sum of the angles of a triangle is equal to two right angles, preventing the possibility of more than one of them being as great as a right angle. For the relations between the sides and angles of a triangle, see TRIGONOMETRY.

The triangle being the fundamental figure of plane geometry, through which the properties of all other figures have been arrived at, the investigation of its properties has always been held to be of primary importance. Of the immense number of results obtained by investigation, we can notice only two or three in this place. The lines joining the angles of a triangle with the points of bisection of the opposite sides, intersect at the same point, as also do the perpendiculars from the angles on the opposite sides, the lines bisecting the angles, and the perpendiculars from the middle points of the sides. The point of intersection of the first series of lines is the center of gravity of the triangle; those of the third and fourth series are the centers of two circles, the former of which touches the sides internally, and the latter passes through its three angular points. Another remarkable property of triangles, known as Napoleon's problem, is as follows: if on any triangle three equilateral triangles be described, and the centers of gravity of these three be joined, the triangle thus formed is equilateral, and has its center of gravity coincident with that of the original triangle. See also TRIGONOMETRY and HYPOTHENUSE. The area of a triangle is half of that of a parallelogram which has the same base and altitude, and is thus equal to half the product of the base into the altitude; it may also be expressed by the formula $\sqrt{S(S-a)(S-b)(S-c)}$, where a, b, c, are the lengths of the sides, and S is half their sum.

In the geometry of the sphere, a triangle is a figure bounded by three arcs of circles (as F, G, H, K, L, and M).

TRIANGLE OF FORCES, in Mechanics, is the name given to a proposition which is merely a formal modification of the *Parallelogram of Forces* (q. v.), and as generally stated, is its converse. The parallelogram of forces enunciates that, if two forces, P and Q (fig.)—represented in direction and magnitude by AB and AC



—inclined at an angle to each other, act on a point A, their resultant, R, is represented in direction and magnitude by the diagonal, AD, of the parallelogram formed on the two lines AB and AC. Now, as the resultant, R, is equivalent to the combined action of P. and Q, it would exactly counterbalance them if acting in the opposite direction AR', but would still be fully represented by the diagonal line AD, taken as from D to A. Also, instead of AB, CD may be taken to represent P. Hence as the sides of the triangle ACD completely represent the three forces, we have the proposition, *that if three forces in the same plane be in equilibrium on a particle, and if in that plane any three mutually intersecting lines be drawn parallel to the directions of the forces, the lengths of the sides of the triangle thus formed will be proportional to the magnitudes of the forces.* Its proof rests upon the previously ascertained fact, that R', P. and Q, three equilibrating forces at A, are proportional to AD, CD, AC, and on the geometrical theorem, that a triangle whose sides are respectively parallel to those of another triangle, has its sides proportional to those of the latter; and consequently, the ratio and relative direction of the forces R, P, and Q, are fully represented by *ad*, *cd*, and *ac*, the sides of the triangle *acd*. Again, as the sides of a triangle are to one another as the sines of the opposite angles, so also are the forces which the sides represent. Hence

$$P : Q : R' :: CD : AC : AD$$
$$:: \text{sin. } CAD : \text{sin. } ADC : \text{sin. } ACD$$

(and substituting the sines of the supplementary angles)

$$:: \text{sin. } QAR' : \text{sin. } PAR' : \text{sin. } PAQ;$$

that is, each force is proportional to the sine of the angle between the directions of the other two.

TRIA'NGULAR NUMBERS. See FIGURATE NUMBERS.

TRIANGULA'TION is the operation of dividing any portion of the earth's surface into triangles of as large a size as possible, which may be called primary, and which must be afterwards subdivided into triangles of a smaller size, forming a great network of secondary or subsidiary triangles, which serve as a means of working down from great to less, and finally completing, by a system of scientific checks, an accurate map or delineation of the region covered by such triangles, forming the geodesical process called a trigonometrical survey. See TRIGONOMETRICAL SURVEY, ORDNANCE SURVEY. The same operation is used in the measurement of an arc of the meridian, for the purpose of ascertaining the length of a degree of latitude or longitude on any part of the earth's surface; but in this case, only primary triangles are necessary, as no topographical detail is required, and the positions of the apexes of the triangles are astronomically fixed in the most careful manner, which is not always done in the triangles of a trigonometrical survey.

In carrying out a system of triangulation, much judgment and an accurate local knowledge of a country are necessary; and it very often happens that a more extensive range of angles can be obtained from a comparatively low station, than from the tops of the highest mountains. The angles of each triangle should be as near equal as possible, and unless local circumstances render it unavoidable, very acute or obtuse angles should not be used. The sides of the primary triangles should be as long as can be conveniently observed, but in practice they vary from 80* miles or more to 4 miles, or even less. The angles are generally determined by a large theodolite, of as simple and strong a construction as possible, which is fixed on the most elevated points of mountain-ranges, &c.

When the apexes of the triangles are very distant, heliostats, or mirrors reflecting the sun's rays, are often used, and in dark or cloudy weather the Drummond light has been employed. The primary triangles being fixed on the spherical surface of the earth, certain formulæ, according to the rules of spherical trigonometry, must be applied to reduce them to the simple calculations for ascertaining, from certain known data, the sides and angles of plane triangles. The whole of those calculations are dependent on the accurate measurement of a base or fundamental line. The instruments invented by Captain Drummond, R.E., with which he measured the base line of the Irish survey at Lough Foyle, and which were afterwards employed by Sir T. Maclear in verifying Lacaille's base-line on the plains of Malmesbury, in the Cape triangulation, appear to have been as nearly perfect as possible. The length of base-lines used in modern surveys varies from 3 to 7 miles; General Roy's original base line of the English survey was 5·19 miles.

At the end of a large triangulation, a second or testing base-line is always measured at a distance from the original one; if the measured length of this agrees with that ascertained by calculation, it may be considered a proof of the accuracy of the work in general. In the survey of Great Britain by Mudge and Colby, bases of verification were measured for at least every 200 miles, except in Scotland, where only one was measured near Aberdeen.

The triangles of the English survey have been extended to and connected with those of France, Russia, &c., as far east as Siberia, and south to Algeria; and it is not at all improbable that the triangles of the Russian survey will eventually be connected at one side with those of the great survey of India, which already has the apexes of many of its triangles on the summits of the Tibetan Himalaya, and to the eastward across Behring's Strait, with those of British America and the United States.—See Yolland's *Account*

* In the survey of India, and also in the process of connecting the triangulation of Ireland with that of Great Britain, many of the sides of the triangles greatly exceeded this length.

of the Measurement of the Base of Lough Foyle (Lond., Longmans, 1847); Colonel Portlock's *Life of Colby;* and art. 'Celestial Measurings and Weighings,' by Sir John Herschel, *Good Words* (1864).

TRI'AS, the oldest group of the Secondary strata, formerly associated with the Permian rocks under the name of the New Red Sandstone (q. v.). The term Trias, or the Triple Group, has been given to these beds by German geologists because they are separable into three distinct formations: the Keuper, Muschelkalk, and Bunter-sandstein; and the name has been generally adopted, as the beds are more fully developed in Germany than in England or France. The German beds have consequently been accepted as the types of the group, and the deposits in Britain and elsewhere are correlated with them.

The typical beds are divided into—1. Keuper (q. v.), with a maximum thickness of 1000 feet; 2. Muschelkalk (q. v.), with a maximum thickness of 600 feet; 3. Bunter Sandstein (q. v.), with a maximum thickness of 1500 feet.

In England, the principal Triassic deposit occurs in a great basin of the palæozoic strata in Lancashire, Cheshire, Shropshire, Staffordshire, and Leicestershire. The eastern base of the great central Pennine range of hills is composed of Triassic beds, which, beginning in Leicestershire, run northwards through Nottingham and York to the coast of Durham. From Staffordshire, another series of these beds may be traced along the valley of the Severn, and crossing the Bristol Channel, through Somerset and Devon, to the southern coast.

TRIBE (Lat. *tribus*, a division, originally perhaps a third part, in reference to the three cantons whose coalescence formed the germ of Rome, q. v.), an aggregate of stocks—a stock being an aggregate of persons considered to be kindred—or an aggregate of families, forming a community usually under the government of a chief. The chief is possessed of despotic power over the members of the tribe. It is commonly said that he has 'patriarchal' power—such power, that is, as fathers in early times exercised over their children. The tribe has been the earliest form of the community among all the races of men.

In a very large proportion of existing tribes, the tribe is an aggregate of several stocks or distinct bodies of kindred. The persons of whom the tribe consists are included in stocks which are, or are accounted, distinct from each other. This organization is sustained by two tribal customs—(1) persons of the same stock are forbidden to intermarry; and (2) kinship is reckoned through females only, so that children are accounted of the stock of their mother. Persons of the same stock, too, owe duties to each other, and are to some extent sharers in each other's liabilities. Thus, an injury done by a man is an injury done by his stock, which may be avenged upon any member of it; an injury done to a man is an injury done to his stock, for which every member of it is bound to seek vengeance. In consequence of the customs above mentioned, a husband must be of a different stock from his wife or wives; he must therefore be accounted of a different stock from his children; and when he has wives of different stocks, their respective children are accounted of different stocks. More than one stock is thus represented in every household; and since a man owes duties to his stock—the duties of acknowledged blood relationship—while to those of his family who are not of his stock, nothing but the accident of birth (only accident) unites him, the family among these tribes has necessarily little cohesion.

The tribal customs which have been referred to, ignore the family altogether; they are founded upon the idea of stock. They are the customs of people with whom the conception of stock was a powerful social influence, when that of the family was impotent—of people who must have been divided into stocks at a time when, possibly, they had *no* family system. It is inconceivable that such customs should have arisen in the face of a family system anything like that which prevails among civilized peoples, or even of such an approach to the family as many of those tribes now possess. And it follows that the family has *grown* among these tribes. It is obviously now growing among them. Now, in many cases, the only obstacle to its rapid development is the firm hold which the idea of stock has taken of the tribal life. On the other hand, the prevalence of customs founded upon the idea of stock proves a prior existence of stocks, or bodies of kindred. The separation into stocks must be older than the customs, at least as customs associated with the idea of stock. And keeping this in view, and considering how difficult it is to conceive of several stocks herding together at the early time when every stranger was an enemy, unless there was some natural connection between them—such a connection as the marriage-law and the system of kinship, when they arose, would establish—it may safely be concluded that each stock was originally a separate tribe. Into the tribe conceived of as a single stock, the marriage-law and system of kinship would gradually bring a variety of neighboring stocks; and thus the tribe would become what it is—an aggregate of stocks. The progress of such tribes appears to have been from the tribe conceived of as a group of kindred to the tribe consisting of several stocks or groups of kindred; and now, though the family is not yet fully developed among them, they seem to be tending to become aggregates of families. The tribes of Australasia are the most perfect examples of the organization above described; but it also exists (or it existed) among the tribes of North, and most of those of South America, among a majority of the known tribes of Africa, and a large proportion of the ruder tribes of Asia.

Suppose male kinship (which must come with the growth of the family) introduced among tribes such as have been spoken of, containing different stocks. First, the stocks existing within the tribe would be fixed, stereotyped, within it; second, the growth of the family would be greatly promoted, and the influence of the idea of stock proportionately diminished. The family would in time rise to the importance originally possessed by the stock; and at length the tribe, still divided into stocks, would become, politically, an aggregate of families. The tribe would thus assume the exact shape which it had in the early ages of Greece and Italy, when it was an aggregate of families included in clans or bodies considered kindred (*gentes*); the exact shape which it now has among the most advanced of existing tribes. Since a tribe of the Australian type might thus develop into a tribe of the classical type, is it not probable that the latter really was the result of such a process of development? Regarded as a hypothesis, this view will be found to fulfil all the conditions of a good hypothesis. And if the circumstances of tribes which have what is popularly termed the marriage law of caste—among the greatest of which a division corresponding to the Roman *gens* prevails—can be reconciled with it, or with an extension of it, we shall have got a hypothesis capable of explaining the formation of tribes in general. The tribes above referred to, whether divided into clans or not, consider themselves of a common stock. They restrict marriage to the stock; but they always forbid marriage within certain degrees of relationship; and in numerous cases—among them, those of the most numerous caste peoples—they also forbid marriage within the clan or body considered peculiarly kindred. It will be convenient, for want of a better word, to speak of this marriage law as caste. And by caste tribes, in what follows, are to be understood tribes which have this marriage law.

Seeing that the law forbidding marriage within the tribe, and the law restricting marriage to the tribe, have both been widely prevalent among human races, both must be conventional, produced by circumstances; and if in their origin they are equally ancient, men, at the first, in respect of their circumstances, must long have been divided into two bodies very differently placed. This, however, is very improbable. There is no evidence for it; there is some evidence against it. The circumstances, too, capable of producing caste must have been isolating circumstances. The effect of an isolated position in producing an approach to caste may be seen in the case of the royal houses of Europe. Excepting, perhaps, mere physical isolation, it is difficult to conceive of isolating circumstances which could operate in the earliest times. Those which can be conceived of, and which are also known to have operated among caste peoples—the pride of conquerors, peculiarities of religion, the sentiment of an aristocracy or a priesthood, hereditary occupations—could only exist when society is somewhat advanced. It thus becomes highly probable that caste did not prevail in the earliest times—was not the original law of any tribes. There is strong corroboration of this in the fact, that it is found imperfectly established—in coures of being established—among not a few existing tribes; and in the fact, that it became the law of peoples—for example, the Hebrews—whose ancestors, according to tradition, followed a different practice. In connection with these considerations, there is conclusive reason for holding that caste was not an original law, in the law of incest which prevails among the greatest of caste peoples, by which marriage is forbidden, not only within certain degrees of relationship, but also within the clan or body of kindred denoted by a family name. The existence of any law of incest among a caste people requires explanation. But how could a prohibition of marriage within the clan arise among people whose principle it was to marry within the kindred? This can only be referred to circumstances which preceded the origin of caste. Does it not, then, suggest the establishment, through the force of isolating circumstances, of caste—the restriction of marriage to the tribe, or to particular tribes—among tribes divided into stocks which had forbidden marriage within the stock? This would, at any rate, account for the facts. The original prohibition, upon this view, is still represented by the prohibition of marriage within the clan. But as tribes advanced, the family usurped the place of the stock; there sprung up a belief in the common origin of the tribe; and the law of succession to family property gave a new importance to near relationships. The law of incest would naturally tend to follow the practically important limits of relationship; and it might, being still applicable to the stock, be held specially binding within those limits; or it might be confined to them, for in the case of small

and simply-constituted bodies, within which the differences of condition and of employment were few and slight, the stocks —pressed, on the one hand, by the growth of the family, on the other, by the growing belief in the common descent of the tribe — would be apt to disappear altogether. The absence of the stock or clan in the case of some of the smaller caste tribes, and the two laws of incest found among caste peoples—one of which, at least, seems otherwise inexplicable—can thus be accounted for consistently with the hypothesis of such peoples having progressed from the organization of the Australian tribe. And it having been shown that caste is not an original law, all other circumstances of caste tribes will be found consistent with that hypothesis. The belief which many tribes have had in their descent from one progenitor, is not corroborated in any case. It cannot prove its own truth. In many cases, it can be shown to be a fiction; it is presumably so in all cases, and it does not afford an argument for or against any theory of the origin of tribes.

The hypothesis of development, as it may be called, is thus capable of connecting together all the varieties of the tribe, the simplest with the most advanced; and it gives us, as the earliest and simplest idea formed of the tribe, that it was a body of persons who conceived themselves to be of a common stock. It is in the favor of this hypothesis that it affords an easy and natural explanation of the peaceable political union and fusion into one people of neighboring tribes; and of the fact, that a population is divided into a greater or less number of tribes, according as it is less or more advanced. Neighboring tribes would contain the same stocks; they would thus be really homogeneous, and related; they would be ready for union as soon as their circumstances brought them into close contact, and made a political union desirable.

There are facts and arguments by which this hypothesis may be raised to so high a degree of probability, that its soundness can scarcely be doubted. A single example of them must suffice. It is the received opinion that among the advanced tribes containing gentes, property was originally vested in the gens, and was only by slow degrees wrested from it by the family. It is involved in this, that at one time the gens was everything, the family nothing, in the organization of the tribe; that the latter grew, and that as it grew, the former sunk in importance. The tribe, when property was exclusively vested in its gentes, must have been an aggregate of gentes, not an aggregate of families. All this is consistent with, and corroboratory of, the hypothesis of development; in particular, it strongly corroborates the view that the tribe at an early period consisted of several bodies of kindred, accounted distinct from each other, and each of which held property in common. It has never been accounted for upon any other view.

The only other theory which has been formed of the origin of tribes—commonly called the patriarchal theory—is, that a tribe consists in the main of the descendants of a single family, descent being chiefly, if not exclusively, reckoned through males; and that the gentes found within the tribe consist of the descendants of individual sons or grandsons of the common progenitor. It is evident that this theory does not explain the organization of the numerous class of tribes first considered. It has been formed upon observation of the advanced tribes of the classical type, but it does not consist with the history of property (to test it at a single, but a vital point) even among them. It might account for property being vested in the tribe; it does not account for it being vested in the gentes. It can only do so by the aid of the assumption that, though the sons and grandsons of the original progenitor had the desire for family property, and divided his property, or accumulated property of their own, their descendants suddenly lost that desire, and began to hold in common. But such a supposition is too improbable to be entertained. This theory is also excluded in the case of all polyandrous peoples, for it assumes that society began with monandric marriage, a perfect idea of the family and male kinship—all conditions the very opposite of those which must at one time have prevailed among such peoples. And polyandry can be shown to have prevailed so widely, that it is probable it has been the earliest practice of every human tribe. However this may be, a theory which is contradicted by a great proportion—much the greatest number—of the cases to be accounted for, and is in important respects not consistent with any class of cases, cannot be a good hypothesis; and therefore the patriarchal theory has no title to be accepted as explaining the normal history of the formation of tribes, or of any class of tribes. Its fundamental assumption, indeed—the segregation of individuals who became progenitors of tribes—seems to be at variance with the nature of man, which all experience has shown to be social and gregarious, and to be the most averse to separate and independent action, when society is the least advanced. It should also be stated that it fails to do what a sound theory of tribal formation must do—to account for the fusion of neighboring tribes, independently of conquest, into one people. To account for this, it has been customary to suppose that neighboring tribes, wishing to unite, adopted one another; but there is no evidence of such adoption having ever been practised, and the supposition seems entirely improbable.

The patriarchal theory was, until recently, the received account of the formation of tribes. The theory which has here been styled the hypothesis of development was first propounded, though without elaboration, in a work published in 1865, *Primitive Marriage*, by J. F. M'Lennan.

TRIBONIA'NUS, a very eminent Roman jurist of the 6th c. of Macedonian parentage, but born in Pamphylia. He held, under the Emperor Justinian, the offices of quæstor, master of the imperial household, and consul. But he is famous chiefly through his labors in connection with the Code (q. v.) of Justinian (q. v.) and the Pandects (q. v.). T. died in 545.

TRI'BUNE. See ROME.

TRI'CHECUS. See MORSE.

TRICHI'ASIS (Gr. *thrix*, gen. *trichos*, of a hair) consists in a growing inwards of the eye-lashes; three or four of them (sometimes only one) presenting their points towards the globe of the eye, while all the other hairs retain their natural position. The disease is exceedingly common among the lower classes, and especially the Irish. This affection causes great annoyance, by exciting a pricking sensation, and by the constantly irritable and watery state of the eye which it induces. The treatment consists in plucking out the offending hairs (if they are few in number) from time to time, each hair being removed by hair-forceps with a slow steady pull. If they form a little group, they must be removed by dissecting out the small portion of lid in which they are implanted, and uniting the wound with a suture. In other cases, it may be necessary to remove the entire margin of the lid.

TRICHI'NA SPIRA'LIS, the name given to a peculiar Nematoid worm, which, in its sexually immature state, inhabits the muscles, usually of the pig. It was discovered in 1835, Mr. Wormald, then Demonstrator of Anatomy at St. Bartholomew's, giving to Professor Owen four microscopical specimens of speckled muscle from a subject that was then in the dissecting-rooms; and Mr. Paget, then a first-year's student, simultaneously investigated the question. Professor Owen, to whom the discovery of the trichina is generally referred, soon afterwards communicated to the Zoological Society his 'Description of a Microscopic Entozoon infesting the Muscles of the Human Body,' in which he describes the speckles as capsules containing a spirally-coiled microscopic worm, to which he gave the generic name trichina (Gr. *thrix*, a hair), and the specific name *spiralis*, from its coiled arrangement. Mr. Paget had independently arrived at similar results, with the aid of Robert Brown of the British Museum, and read a paper on the subject to the Abernethian Society a week before Professor Owen's memoir was read to the Zoological Society; so that his name should always be *at least* associated with that of Owen, in reference to the discovery of this worm. From the date of this discovery to the present time, the *trichina* has been a fertile source of discussion. In 1845, the idea was mooted by various naturalists that the trichina was the undeveloped or sexless form of some other worm; and in 1855 (after the transformation of the cysticercus into the tapeworm was discovered), various suggestions were made on this subject; but it was not till 1860 that Virchow and Leuckart, by feeding animals on flesh containing trichinæ, arrived independently at the correct conclusion, that the parents of the encysted trichinæ are small nematoid worms, which had never previously been described, Leuckart's experiments being made with human flesh containing these parasites.

The young trichinæ, as they are seen in the human muscles, present the form of spirally-coiled worms, in the interior of small, globular, oval, or lemon-shaped cysts, which appear as minute specks scarcely visible to the naked eye. These cysts are more or less covered externally with calcareous matter, according to the length of time they have remained in a fixed position, and the degree of degeneration which their walls have undergone. The trichina measures, according to Cobbold, on an average $\frac{1}{78}$th of an inch in length, and $\frac{1}{180}$th of an inch in breadth. The cysts are sometimes altogether absent, and hence they must be regarded as abnormal formations, resulting from local inflammation set up by the presence of the worm, which in this larval condition of existence measures $\frac{1}{78}$th of an inch in length, and $\frac{1}{830}$th of an inch in breadth. These larval worms exhibit a well-marked digestive apparatus, and afford evidence of the presence of reproductive organs, which are often sufficiently developed to enable the observer to determine the sex of the organism. The number of larval trichinæ that may simultaneously exist in the muscles of a single man or animal is enormous. In a cat on which Leuckart experimented, a single

Fig. 1.
The worm lying coiled up in muscle, the outside of the cyst supporting fatty tissue, vessels, &c. [magnified.]

ounce of flesh was estimated to contain 325,000 trichinæ; and if all the voluntary muscles of a human body of ordinary size were similarly affected, the number of worms would exceed 1950 millions! Dr. Cobbold believes that there can be no doubt that the number in a single 'bearer' (as he terms the sufferer) may *actually* amount to at least 20,000,000.

We now proceed to the consideration of the mature worms. When an animal is fed with flesh containing the larval worm already described, and is killed a few days afterwards, a large number of minute worms are found mixed with the contents of the small intestines. On closer examination, they are found to be of two kinds—the larger and more numerous ones being the females, and the smaller and rarer ones the males. At the second day after their introduction, these intestinal trichinæ attain their full sexual maturity; and in six days, the females contain perfectly developed and free embryos in their interior.

The female is a slender round worm, varying in length from $\frac{1}{3}$th to $\frac{1}{4}$th of an inch. The anterior end presents a bead-like

Fig. 2.

Sexually mature female *Trichina spiralis* (highly magnified).

appearance, from which the intestinal canal proceeds. The posterior three-fourths are mainly occupied by the reproductive organ, which is filled partly with free embryos, and partly with eggs in various stages of maturity. When these embryos have attained their full size within the uterus of the parent, they pass out at the genital aperture, and commence life on their own account.

The accompanying diagram shows these embryos (highly magnified) in various stages of development. They are little worms

Fig. 3.

with rounded ends, and presenting no indications of any internal organs. Before entering into the history of their migrations, we may mention that the male worm is seldom more than two-thirds

Fig. 4.

Sexually mature male *Trichina spiralis* (highly magnified).

the length of the female. It presents the same bead-like arrangements as the female, and a reproductive organ whose aperture apparently coincides with the anus; while the female sexual aperture is comparatively near the head-end of the worm. The body terminates with two hooks (of which only one is seen in the figure), which are doubtless subsidiary to the reproductive process. The males are less numerous and shorter lived than the females, and probably die after having discharged their natural function. The females continue bringing forth young for a period of two or three weeks. The embryos, according to Leuckart, Cobbold, and all our best helminthologists, penetrate the walls of the intestine, and pass directly into the muscles of their 'bearers' or 'hosts,' where, if the conditions are otherwise favorable, they are developed into the form originally observed by Owen and Paget. In this way, by proceeding along the course of the intermuscular connective tissue, some of them reach the muscles of the extremities and other distant parts; but the majority of the wandering embryos (according to Virchow) 'remain in those sheathed muscular groups which are nearest to the cavity of the body (abdomen and thorax), especially in those which are smaller and most supplied with connective tissue.'

These embryos penetrate into the interior of the separate muscular bundles, and in the course of 14 days acquire the size and organization of *Trichina spiralis*. The surrounding tissues soon become disorganized, and the spot inhabited by the coiled-up worm is converted into a spindle-shaped widening, within which the previously described cyst is formed by a hardening and calcification of the exterior. A point of great importance in relation to the distribution of this parasite, and as having a practical bearing upon the disease known as *Trichiniasis* (q.v.), has been established by the experiments of Davaine—viz., that while in the adult condition, trichinæ perish in cold water in about an hour, and cannot survive the decease of their host for more than six hours, the larvæ remain alive in water for a month, and will live for a long time in flesh which has become putrid. In this way, 'a carcass near a marsh or rivulet may communicate the parasites to the ruminants that drink the water, or to pigs.'

In the same year (1860) in which Virchow and Leuckart proved, that by feeding an animal on flesh containing the *Trichina spiralis*, intestinal trichinæ were produced, and watched the transformation of the young of the latter into muscular trichinæ, a very important corroborative medical case was observed and recorded by Zenker. In this case, the patient was a servant-girl, aged 20, and the principal symptoms were loss of appetite, prostration, violent pains and contraction of the limbs, and finally œdema, which, with a certain amount of pneumonia, terminated fatally in the course of a month. After death, numerous larval trichinæ were found in her muscles, while the intestinal canal contained sexually mature worms.

Three weeks previously, before the girl had taken ill, she had assisted in killing pigs and making sausages. It was further ascertained that, a few days before her illness commenced, she had eaten some of the meat in a raw state. On examination, it was found that the pork (both hams and sausages) contained numerous encysted trichinæ. It was, moreover, ascertained that the butcher and several members of the girl's family (to whom she had probably given sausages) were attacked with symptoms similar to those which, in her case, proved fatal. How the pig acquires its trichinæ is unknown; but that the larval trichinæ contained in putrid flesh, &c., may easily gain admittance to the pig's alimentary tract, is a supposition at once feasible and of likely kind. Beet-root, earth-worms, moles, and rats have been suggested as their infectors; but on this subject see the advice given by the French commissioners in the next article. The adult trichina is liable to infest the intestinal canal of all animals in which the larvæ have been found in the muscles. In this category must be placed man, the dog, cat, rabbit, rat, mouse, mole, hedgehog, and badger. Whether birds ever contain trichinæ is doubtful, and reptiles and fishes are quite free from this parasite.

TRICHINIASIS is the name of the diseased condition which is induced by the ingestion of food containing *Trichina spiralis* in large quantity. The first recorded case, as occurring in the human subject, is that of Zenker, which has been already noticed in the article TRICHINA; but there can be no doubt that the disease has long existed, although its origin was previously unsuspected. The first symptoms of this disease, as it occurs in the human subject, are loss of appetite, followed by nausea and a sense of fatigue, prostration, and general indisposition. This stage lasts about a week. Pain and stiffness of the limbs, accompanied by swelling of the face, and fever of a peculiar type, characterized by a very frequent pulse, moderate thirst, and copious perspirations, now show themselves; the commencement of the second stage of the disease being thus synchronous with the migration of the trichinæ brood into the muscles, there to become encysted. During this stage, pressure, or any attempt to move the parts under the control of the swollen muscles, is intensely painful, and even the normal respiratory movements cause such constant pain as to render sleep impossible. In severe cases, the patient lies on his back like a paralyzed person. The tongue presents much the same appearnce as in ordinary gastric fever.

The bowels are most commonly constipated, but in some of the worst cases, there is continuous diarrhœa. The swelling which began in the face now disappears, and is replaced by swelling of the feet, which gradually rises to the trunk. In about the fourth week of the disease, the trichinæ may be regarded as permanently settled, and as having completed their destructive action on the muscles. This is the beginning of the third stage, which is mainly characterized by extreme weakness. The gastric symptoms abate, the appetite returns, and, in favorable cases, the muscular pains and swelling gradually diminish, while, in severe cases, this third stage is the most dangerous part of the disease;

the diarrhœa being severe, and accompanied with tenesmus, and often with the involuntary discharges of the fæces and urine, while the skin exhibits extreme palor, and is enormously distended with effused serum. Moreover, pneumonia often supervenes at this period. The fourth and last stage is that of convalescence. This may begin at the fifth week, or later, and may last from three weeks to as many months. In mild cases, it is impossible to draw a definite line between this and the preceding stage. Death may occur at any period. It has been observed as early as the 5th, and as late as the 42d day of the disease.

A single trichinous pig, if its flesh is eaten without being previously submitted to such culinary processes as to destroy the vitality of the larval trichinæ, may establish a local epidemic of this disease. The most important of those epidemics have occurred in Germany, and are noticed by a German physician, Dr. Thudichum, in 'The Seventh Report of the Medical Officer of the Privy Council,' 1865. Of these, the second or great epidemic at Hettstädt was the most severe. It commenced in the second half of October 1863, and affected 158 persons, of whom 28 died. All these persons were found to have been eating trichinous pork, either perfectly raw, or in the form of smoked or fried sausage, meat-balls, brawn, black-pudding, &c.

As soon as a case of suspected trichiniasis comes under the notice of the physician, attempts should be made to remove the mature worms from the intestine by active purgation. For this purpose, calomel, in scruple doses, is more serviceable than any other purgative. Two or three such doses should be given at intervals of 24 hours. No special directions can be given for the treatment of the fever. If there is any appetite, the diet should be light, and at the same time nourishing. Liebig's Extract of Meat has been found very serviceable in keeping up the strength. The most effectual remedy for the sleeplessness was found to be the cold wet sheet, in which the patient should be wrapped repeatedly during the day. The preparations of opium only aggravate the discomfort. The other symptoms must be treated by the ordinary rules of therapeutics.

Considering the gravity of this disease, it would be of the greatest importance to be able to decide, during its life, whether a pig were trichinous or not. On this point there is some difference of opinion; but Professors Delpech and Reynal, who were charged by the French government to report upon this disease, assert that 'the animal, while living, shows no signs of the presence of trichinæ, nor can they be detected in the meat with an ordinary lens, but a powerful microscope renders them at once visible.' In Hanover, out of 25,000 pigs, 11 were found trichinous; in Brunswick, 16 were affected out of 14,000; while in Blakenburg, 4 were diseased out of 700. The French commissioners assert that a temperature of 167° F. is sufficient to kill the parasites, and that meat thoroughly salted is also perfectly safe; they advise that smoke-dried sausages, though probably safe, should be well boiled. They further attribute the spread of the disease among pigs to the fact that they are foul feeders, and will eat any offal, such as the dead bodies of rats and other animals, which are known to be liable to the disease. They recommend farmers to be very cautious in feeding their pigs to avoid giving them flesh without first boiling it; to destroy rats and small carnivorous animals, and never to leave human or other excrements in places where pigs can reach them. Finally, they advise all experimenters to burn trichinous flesh when their investigation is completed, and not to throw it away; for a fragment of it might possibly be eaten by a rat, the rat devoured by a pig, and the pig thus become the medium of the disease to man. This utter destruction of the parasites is a point on which our countryman, Dr. Cobbold, has long insisted. In 1863, a trichinous pig from Valparaiso, killed on board a merchant-vessel on the high seas, caused the death of two of the crew; and in 1864, there was a slight trichinous epidemic at Cheektowaga, New York. Probably trichina-disease is a common ailment in this and other countries; its symptoms, save in very severe cases, attracting no special notice, from their similarity to those of rheumatic disease and acute febrile attacks. The disease has been known to occur in the N.W. of England in a mild form; but helminthology, and the detection of parasites of all kinds, requires still much cultivation at the hands of the medical profession. In 1835, Mr. Wood of Bristol published, in the *Medical Gazette*, a case of acute rheumatism, accompanied by pneumonia, in which trichinæ were discovered after death; thus *all but* anticipating Zenker in discovering a new disease.

TRICHINO'POLY (more correctly, TRICHINAPALLI), the capital of a collectorate of British India of the same name with an area of 3515 sq. m., on the right bank of the Kaveri, 30 m. W. of Tanjur. The fort, which includes the old town, stands on the rugged slope of a steep granite rock, 500 feet in height, which from some points resembles Edinburgh Castle. The walls of the fort, which are now demolished, had a circuit of two miles, and this area is inhabited by a dense population, dwelling in low, closely-packed huts. The streets are tolerably regular, and are crowded at all hours of the day with multitudes of passengers, bullock-carts, and cattle. Beyond the walls is St. John's Church, containing the tomb of Bishop Heber, who was buried here in 1826. The climate during eight months of the year, is exceedingly hot, nevertheless T. is the headquarters of the south division of the Madras army; there are several barracks, and the lines for the men and the officers' houses cover a space of ground six miles in circumference. Cheroots are manufactured in large quantity, from excellent tobacco grown in the vicinity. Manufactures of hardware, cutlery, and jewelry, especially gold chains, harness, and saddlery, are extensively carried on. A railway to Madras was opened in 1875. Pop. in 1871, 76,530. Pop. of district (1871) 1,200,408.

TRICHOCE'PHALUS (derived from the Gr. *thrix*, gen. *trichos*, a hair, and *cephale*, the head) is the name given to a genus of intestinal worms, of which one species, *T. dispar* (described by the older writers, who mistook its head for its tail, as *Trichuris* and *Ascaris trichiura*), infests the human intestinal canal. Dr. Cobbold describes it as a small nematoid worm, the male measuring 1½ inches, and the female fully 2 inches in length; it is characterized by an extremely long hair-like head and neck, occupying about two-thirds of the entire length of the body. This parasite is comparatively rare in this country, while, according to M. Davaine, not less than one-half the inhabitants of Paris are infested by it. Its presence is attended with little or no inconvenience. Its development and mode of gaining access into the body are subjects to which much attention has recently been paid, but which are by no means as yet cleared up. Davaine finds that the eggs are not developed within the host's intestines, but are discharged *per anum*, in the immature condition in which they escape from the parent; and it further appears, that after their expulsion, a period of six months must elapse before embryonic formation commences. As in the more common instance of *Ascaris lumbricoides*, it is probable that they complete their development in open water, from which they are transferred to the human stomach.

For further information on the genus *Trichocephalus* generally, we may refer the reader to Part I., chap. v. of Dr. Cobbold's *Entozoa;* while the species considered in this article is fully discussed in Davaine's *Traité des Entozoaires.*

TRICHO'PTERA. See CADDICE.

TRICK, a term used in Heraldry to denote a mode of representing arms by sketching them in outline, and appending letters to express the tinctures, and sometimes numerals to indicate the repetition of changes.

TRICLI'NIUM, the apartment in a Roman house in which the meals were eaten.

TRI'COLOR means literally no more than a flag in three colors, which is the case of almost every national ensign; but the applied sense limits it to flags having three colors in equal masses. The principal European tricolor ensigns are: France—blue, white, red, divided vertically. German Empire—black, white, red, divided horizontally. Italy—green, white, red, divided vertically. Belgium—black, yellow, red, divided vertically. Holland—red, white, blue, divided horizontally. The tricolor took its rise at the commencement of the French Revolution as the badge of the National Guard. The red and blue were selected as the arms of Paris, and the white was added, as the color of the army, to show the intimate union which should subsist between the people and the armed force.

TRICOUPIS, SPIRIDION, a modern Greek statesman and author, son of a primate of Missolonghi, was born in that town in 1791. After completing his studies in France and England, he went to the Ionian Isles, where he aided Lord Guilford in the foundation of the university of Corfu (1820); but on the outbreak of the war of independence in the following year, he hastened to enrol himself among the patriots, and played an important part in the great struggle. From 1821, except during the presidence of Capo d'Istria, he was continually employed in administrative and diplomatic business. During the reign of King Otho, he was thrice sent to London (1835—1838, 1841—1843, and 1850—1855) as envoy-extraordinary; he was Minister of Foreign Affairs and of Public Instruction (1843); vice-president of the Senate (1844—1849); and envoy-extraordinary to Paris (1850) on the occasion of the blockade of the ports of Greece by England. In the grave political vicissitudes he had his share, and in 1862 declined to form a ministry on account of ill health. He died in 1873.

T. enjoyed a great reputation in his own country as an orator and historian. His funeral oration on Lord Byron (whose friend and comrade he had been), delivered in the cathedral of Missolonghi, some days after the poet's death, has been translated into most European languages. Many other orations, partly religious and partly political, spoken by T. in the course of the revolution, have been collected and published (Paris, 1836). Besides these, we must mention a martial poem on the Klephts (*Poiema Kleph-*

tikon, Par. 1820); but his masterpiece is his History of the Greek Revolution (*Historia tes Hellenikes Epanastaseos*, Lond. 1853—1854), a work which is praised for its accuracy, impartiality, and style.

TRIDA'CNIDÆ, a family of lamellibranchiate molluscs, having the shell open, the valves equal, the foot small, and furnished with a byssus. *Hippopus maculatus*, the BEAR'S-PAW CLAM (q. v.), is prized for its beauty. *Tridacna gigas* is remarkable for its great

Tridacna gigas.

size, exceeding that of any other bivalve. The shell of a single specimen has been known to weigh more than 500 lbs. The valves are sometimes used in Roman Catholic churches for holy-water vessels. They are also used as an ornament for grottoes and fountains. They are deeply furrowed and beautifully grooved. This great mollusc is a native of the East Indies, and is found in shallow water. It is used for food, and one suffices for a number of persons.

TRI'DENT, in classic Mythology, is used as the symbol of Neptune's sovereignty over the sea. It consisted of a staff, armed at one end with three short prongs, with double barbs at the points, resembling the *fuscina* used by the Italians in catching large fish, particularly the sword-fish, from which we may perhaps infer that Neptunus was originally the god of fishermen. It was customary among the Grecian states to place the figures of their patron deities, or their appropriate symbols, on coins; hence, we frequently meet with the trident on ancient coins, such as those of Saguntum, &c.; likewise on the Sicilian coins of Hiero, &c.

TRIE'NNIAL PRESCRIPTION, in the Law of Scotland, is a limit of three years imposed on all creditors to bring their actions to recover a certain class of debts and damages—such as actions to recover merchants' accounts, servants' wages, house-rents (where the lease is verbal), debts due to tradesmen, lawyers, and doctors. So actions to recover damages for wrongous imprisonment must be brought within three years.

TRIÉ'ST, or TRIË'STÉ (Slav. *Térst*), the most important seaport of the Austrian monarchy, and the most considerable trading town on the Adriatic, stands at the head of the Gulf of Triest, an arm of the Gulf of Venice, 90 miles south-west of Laibach, on the Vienna and Triest Railway. It is an imperial free town, and attached and belonging to it is a territory 46 sq. m. in extent, consisting of the slopes of the *Triestiner Karst*, which decline somewhat abruptly toward the Adriatic shore. The city of T., in which the population of the district is almost wholly massed, the other places being only small villages, consists of the old town, the new town, or Theresienstadt, and the two suburbs, Josefstadt and Franzenstadt. The old town, built on the slope of a steep hill, surmounted by a castle, forms about a fourth of the whole city, and is distinguished by its narrow streets and black walls. It contains the cathedral, an early Byzantine edifice of uncertain date, into the walls of which stones bearing Roman inscriptions and carving have been built, and the tower of which is said to rest on the foundation of a temple of Jupiter. The new town, with broad streets built in regular parallelograms and handsome houses, occupies the plain that fronts the sea. Between these two divisions runs the *Corso*, the chief thoroughfare of the city.

The *Tergesteum*, in the new town, is a splendid modern edifice, built in 1842, and containing a bazaar, a grand concert and ball room, exchange and reading rooms, and the offices of the Austrian Lloyd's, the largest establishment in Europe for sea-steamers. To the north, on the sea-shore, is the new and magnificent Lazaretto, with a harbor in which 60 vessels can perform quarantine at once. There are numerous churches for Greeks, Jews, Roman Catholics, and Protestants. The population includes Germans, Americans, Italians, Greeks, Jews, Armenians, Dalmatians, &c.; but Italian is the prevailing language. T. was, till 1882, a free port; the harbor, the entrance to which is uninterrupted by islands or sandbanks, is well protected. The manufactures carried on here are very extensive. There are upwards of 40 establishments for shipbuilding, and several soap-works and rope-works. Rosoglio, white-lead, and leather are manufactured, and wax-bleaching is carried on. The value of the imports is about £14,000,000; that of the exports, £10,000,000. A great agricultural exhibition was held at T. in 1882. Pop. in 1880, 74,544; of the city with the surrounding district of T., about 133,000.

T., the ancient *Tergeste* or *Tergestum*, was of importance under the Romans, and first receives historical mention 51 B.C., when it was overrun and plundered by neighboring tribes. It was much improved by Augustus; and, in 1382, finally passed into the hands of Austria. It owes its prosperity chiefly to the Emperor Charles VI., who constituted it a free port, and to Maria Theresa. Since the year 1816, T. has borne the title of 'The most Loyal of Towns.'

TRIFLE, a supper-dish at evening entertainments. It consists of two parts. The lower is usually made of sponge-cakes, ratafias, or macaroons, soaked in sherry or Madeira, and placed in the bottom of a proper glass-dish; over these is then poured a mixture of fine boiled custard and of cream, in equal parts; and sometimes another layer of the cakes is laid, well soaked in sherry. A whip, or syllabub, is then made with sugar, cream, white of egg, and sometimes a little white wine and brandy, the froth of which, as it is formed by the whisk, is removed, and placed over the soaked cakes, and forms the second part of light froth of the trifle. Almost every cook has some variation in the manufacture of this dish.

TRIFO'LIUM. See CLOVER.

TRIFO'RIUM, the arcade over the arches of a church between the central and side aisles. It is usually a dark gallery, being the wall-space against which the lean-to roof of the aisles rests. In the later styles, the side-aisles were covered with independent roofs, so as to allow the triforium arches to be filled with glass.

TRIGGER. See LOCK.

TRI'GLA. See GURNARD.

TRI'GLYPH, the ornament in the frieze of the Doric Style (q. v.). It is supposed to represent the ends of the beams in the original wooden temples. It is always divided into channels or flutes, with guttæ or drops below—see illustration.

Triglyph.

TRIGO'NIA, a genus of mollusca, represented at the present day by only three species, natives of Australia, but remarkably abundant in the secondary rocks. Upwards of 100 species have been described from strata between the Trias and the Chalk inclusive, but not a single species is known from any Tertiary deposit. The shell is trigonal (whence the name), thick, and tuberculated, or ornamented with radiating or concentric ribs. The interior is nacreous. The external ligament is small and prominent, and the huge teeth are large, diverging, and transversely striated. The animal has a long, pointed, and powerful foot, with which it is able to make considerable leaps. The gills are ample, and united behind the body to each other and to the mantle.

TRIGONOCA'RPON, a common fruit in the Coal-measures, occurring in all the strata except the underclays and limestones. Some six or eight species have been established, which differ from each other in size and shape—some being as small as a pea, and others as large as a walnut. They are marked, when preserved in the round, with three longitudinal ridges, and from this character the name was derived. They have never been found attached to any plant. From their shape, and their occurring in such quantities in some localities that they might be gathered by the bushel, it was at first thought that they were palm-fruits; but Dr. Hooker, from the examination of several specimens which exhibit structure, has shown that they are not unlike the structure of *Salisburia*, a drupe-bearing coniferous tree, a native of China and Japan. He found that they were composed of four distinct integuments, and a large internal cavity filled with carbonate of lime, but which, he supposed, originally contained the albumen and embryo. The determination of the affinities of this fruit is the more important, as the existence of conifers in the Coal-measures was known from the occurrence in them of disc-bearing woody-tissue; and the absence of linear leaves and cones makes it the more likely that they belonged to the drupe-bearing division of the order. It is probable that the trunk, to which the generic name *Dadoxylon* has been given, and the casts of the large pith of which is known as *Sternbergia*, had for its leaves the fern-like fossils named *Noggerathia flabellata*, and *Trigonocarpon* for its fruit. Dr. Dawson has, however, recently referred some *Trigonocarpa* to *Sigillaria*, and he considers the anomalous organism called *Antholites* to be the bud-form of the fruit. He has never found them in contact with *Sigillaria*, and it is much more probable that this was a cryptogamous tree, and consequently had spores, and not seeds, for its fruit.

TRIGONOCE'PHALUS, a genus of extremely venomous serpents, of the family *Crotalidæ*, nearly allied to rattlesnakes, but

having the tail terminated with a spine instead of a rattle. The head is covered with plates or shields; the dorsal scales are keeled. *T. rhodostoma* may be mentioned as an example. It is found in Java, and preys chiefly on frogs. *Cenchris*, *Craspedocephalus*, and other genera have recently been separated from trigonocephalus. The Mokassin Snake of the southern states of North America belongs to the genus *Cenchris*. One of the most dangerous serpents of the West Indies is *Craspedocephalus lanceolatus*.

Trigonocephalus rhodostoma.

TRIGONOME'TRICAL SURVEY. Trigonometrical surveying is that higher branch of measurement of the earth's surface in which the use of angular instruments, such as the theodolite, altitude, and azimuth instrument or sextant, is indispensable in forming the network of triangles, on the accuracy of which the correctness of the survey depends. In the article TRIANGULATION, the necessary operations have been briefly adverted to, and in ORDNANCE SURVEY will be found a sketch of the history of the principal modern trigonometrical surveys executed, or now being made.

In the *Aide Mémoire of Military Sciences*, conducted by officers of the corps of Royal Engineers, a very full and complete article will be found on this subject; and the government blue-books, from time to time issued on the surveys both of this country and India, afford much valuable information on the internal economy and arrangements necessary for carrying on such vast works.

When it is necessary to fix the astronomical position of the stations, of course, the transit, zenith, sector, and other instruments used in the observatory, must be transferred to situations very often difficult of access, exposed to strong winds, &c., which adds much to the difficulty of getting correct observations. Meteorological and magnetic observations are often taken simultaneously with the astronomical; and, indeed, are now considered as nearly indispensable in modern operations. See SURVEYING, TRIANGULATION, &c.

TRIGONO'METRY (Gr. *trigonon*, a triangle, *metria*, measurement), the measurement of triangles. This definition, though expressing correctly enough the scope of trigonometry in its early stages, is now wholly inapplicable, as trigonometry, like geometry, has far exceeded its primitive limits; and though the original name is, for convenience, retained, the science may be more properly defined as the 'consideration of alternating or periodic magnitude.' Trigonometry, within the limits of its earlier definition, is geometrical; its advance beyond these limits is due to the introduction of purely algebraic methods.

The quantities with which geometrical trigonometry has to deal are certain lines definitely placed with respect to an angle, and consequently varying with it. These lines, generally denominated *trigonometrical functions* of the angle, are the sine, cosine, tangent, cotangent, secant, and cosecant; and are represented in the accompanying figure. The angle BAC is placed at the center of a circle, called the circle of reference; its *sine*, CD, is the perpendicular let fall from the extremity of one radius upon the other; the *cosine*, DA, is that part of the radius between the foot of the sine and the center; the *tangent*, BE, is drawn at right angles to one radius to meet the other produced; the *secant*, AE, is the radius produced to meet the extremity of the tangent; the *cotangent*, FG, is drawn from the extremity of a radius at right angles to one of the former, to meet the other produced; and the *cosecant*, AG, is the radius produced to meet the extremity of the cotangent.

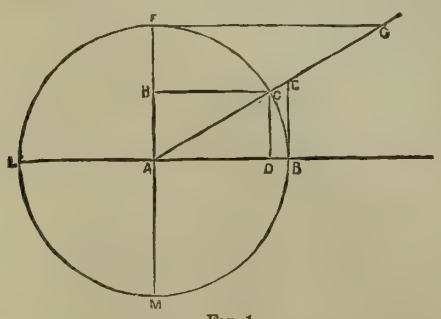


Fig. 1.

Other functions, as the *versed sine*, DB, which is the distance from B to the foot of the sine, and its counterpart, the *coversed sine*, FH, have been occasionally introduced and defined, but they are of no practical use. EAF, the angle which must be added to BAC to make up a right angle, is called the *complement* of BAC; and CAL, the defect of BAC from two right angles, is called its *supplement;* and by inspection of the figure, we can see at once that the sine of BAC, CD, is equal to AH, the cosine of its complement; that the cosine of BAC, AD, is equal to CH, the sine of its complement; and that generally any function of an angle is the co-function of its complement, and *vice versâ;* also, that CD, the sine of CAB, is also the sine of its supplement; AD, the cosine of CAB, is the cosine of its supplement; and that generally the function of an angle is the function of its supplement. If a right angle be added to BAC, then we have the triangles ADC, ABE, shifted so as to be situated in the same relative position to AF as they now are to AB, and each line is consequently at right angles to its former position; hence the sine of BAC is the cosine of (90° + BAC), and similarly of the others. By an extension of this process of investigation, we arrive at the general conclusions, that *if an angle be added to or taken from one or an odd number of right angles, the function of the original angle is the co-function of the one so derived;* and that *if an angle be added to or taken from an even number of right angles, the functions of the original angle are the functions of the derived one.* But since a function of an angle is the same function of its supplement, a knowledge of the function would not enable us to determine to which of the two angles it belonged, unless we possessed some knowledge of more than the mere magnitude of the function.

This desideratum is supplied in the following manner: B is taken as the zero-point of reckoning, the radius BA, which is thus supposed to be fixed, is one of the bounding lines of every angle, the other side being supposed to move in the direction BFL, as the angle increases. Let the radius AC be supposed to sweep round the circle in a left-hand direction (viz., towards F), then, as it approaches F, the sine CD increases, till, on reaching F, the sine coincides with the radius; passing F, and moving towards L, the sine diminishes, till, on reaching L, it becomes zero. Continuing its progress round the circle, the angle BAC becomes *re-entrant* (viz., greater than two right angles); and its sine again increases, becoming equal to the radius at M, and diminishing in the fourth quadrant till it becomes zero at B. While the angle increased from B to L, the sine was drawn *downwards;* for the other half of the revolution, it was drawn *upwards*; hence, in the first and second quadrants, the sine is said to be *positive*, and in the third and fourth, *negative*, the position of a function in the first quadrant being adopted as the standard. The following table shows the variation (increase or decrease, and between what limits, as well as the sign affecting it) of each of the functions as the angle increases.

Angle.	Sine.	Cosine.	Tangent.	Secant.	Cotangent.	Cosecant.
0° to 90°	inc. 0—R, +	dec. R—0, +	inc. 0—∞, +	inc. R—∞, +	dec. ∞—0, +	dec. ∞—R, +
90° " 180°	dec. R—0, +	inc. 0—R, —	dec. ∞—0, —	dec. ∞—R, —	inc. 0—∞, —	inc. R—∞, +
180° " 270°	inc. 0—R, —	dec. R—0, —	inc. 0—∞, +	inc. R—∞, —	dec. ∞—0, +	dec. ∞—R, —
270° " 360°	dec. R—0, —	inc. 0—R, +	dec. ∞—0, —	dec. ∞—R, +	inc. 0—∞, —	inc. R—∞, —

We here observe that all the functions increase and decrease alternately as the angle of which they are the functions passes from one quadrant to another; also that the sine and cosecant are affected by the same signs, as also are the cosine and secant, and tangent and cotangent.

Again, from fig. 1 we obtain, from the properties of right-angled and of similar triangles, the following relations between the functions: $\text{Sin.}^2 + \text{Cos.}^2 = R^2$, $\text{Tan.}^2 + R^2 = \text{Sec.}^2$, $\text{Cot.}^2 + R^2 = \text{Cosec.}^2$, Tan. : R : : Sin. : Cos., Sec. : R : : R : Cos., Cot. : R : : Cos : Sin., Cosec. : R : : R : Sin., and Cot. : R : : R : Tan. From these eight relations, we can easily obtain any one function in terms of any other, both as regards its magnitude and sign.

The reason why the circle and its radius are employed in the definition of the functions is, that we may obtain some invariable standard by which to estimate them, for while, as the angle increases from 0° to 360°, its functions are in a state of constant change, their standard of reference, the radius, remains ths same. For greater simplification, the radius is taken as unity, and the relations become $\text{sin.}^2 + \text{cos.}^2 = 1$, $\text{tan.}^2 + 1 = \text{sec.}^2$, $\text{cot.}^2 + 1 = \text{cosec.}^2$, and (by the reduction from the proportional to the div-

isional form of the other five relations) $\tan. = \frac{\sin.}{\cos.}$, $\sec. = \frac{1}{\cos.}$, $\cot. = \frac{\cos.}{\sin.}$, $\text{cosec} = \frac{1}{\sin.}$, $\tan. = \frac{1}{\cot.}$; the various functions being expressed in terms of the assumed unit. Thus, in the right-angled triangle ABC (fig. 2), if AC be radius, BC = sin., and AB = cos., of the angle A; but if the radius be assumed as unity, $\sin. A. = \frac{BC}{AC}$, $\cos. A = \frac{AB}{AC}$ and similarly from the above relations, $\tan. = \frac{BC}{AB}$, $\sec. = \frac{AC}{AB}$, $\cot. = \frac{AB}{BC}$, and $\text{cosec} = \frac{AC}{BC}$, and in algebraic trigonometry these latter are the definitions of the trigonometrical functions.

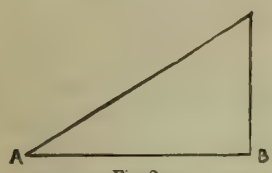

Fig. 2

The only angular functions which geometry enables us to determine with accuracy are those belonging to the angles of an equilateral triangle (Euc. I. 1), an isosceles right-angled triangle (Euc. II. 9), and an isosceles triangle which has each of the angles at its base double of the third angle (i. e., base angles each 72°, vertical angle, 36°) (Euc. IV. 10); and from these, by means of a proposition (demonstrated in all text-books on the subject) which determines the functions of the angle (A + B) from a knowledge of the functions of A and of those of B; and also, as a corollary to the preceding, the functions of 2A, 4A, 8A, &c., and inversely of ½A, ¼A, &c., from a knowledge of those of the angle A, have been obtained and tabulated the functions of all angles from 1′ to 45°, the functions of angles from 45° to 360° being, as is evident from the above remarks respecting complementary and supplementary angles, merely repetitions of these.

The relations between the angles and sides of a triangle (fig. 3) are three in number, and are obtained from simple geometric considerations; they are—(1) AB : AC : : sin. C : sin. B; (2) $\cos B = \frac{AB^2 + BC^2 - AC^2}{2\,AB\,.\,BC}$; (3) AB + AC : AB − AC : : tan. ½(B + C) : tan. ½(B − C). From these relations, in conjunction with the fact that the three angles of a triangle collectively amount to 180°, it is possible, having given any three (one being always a side) of the six elements (three sides and three angles) of a triangle to determine the other three. It is this that constitutes trigonometry in its primitive and elementary form. If the triangles be right-angled, only the first relation, and the property of the sides of a right-angled triangle are necessary for the complete solution. Further information on this subject will be found in any text-book.

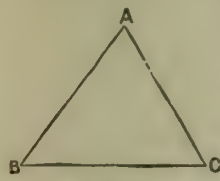

Fig. 3.

Algebraic trigonometry is one of the most important branches of analysis, but is too extensive and varied to be even sketched here; suffice it to say, that in it the trigonometrical functions are not considered as geometrical magnitudes, but as numerical quantities having certain relations to each other, and that the circle as well as the angular functions are treated as multiples or submultiples of the radius. Many important results, such as the approximate estimation of the circumference of a circle, the completion of the solution of cubic equations, &c. have been obtained by its means; and a thorough knowledge of its modes and results is absolutely necessary to an acquaintance with higher mathematics.

Spherical trigonometry is plane trigonometry applied to spherical triangles. See any text-book.

TRI′KHALA, or TRIKALA, a town of the kingdom of Greece, 33 miles west-south-west of Larissa. It is built on the slope of a hill, manufactures cotton and woollen stuffs, and has a large transit-trade. The neighboring plains, which are watered by the Salambria (anc. *Peneus*), are rich in all sorts of fruits. Pop. about 6000. T. is the *Trikka* of Homer, and was celebrated for its temple of Æsculapius. T. was ceded to Greece, along with South Thessaly, in 1881.

TRILLIA′CEÆ, a small natural order of plants belonging to the class Dictyogens (q. v.) of Lindley. They are herbaceous plants, with tubers or root-stocks, whorled leaves, hermaphrodite flowers; perianth of six leaves, the three inner leaves sometimes colored; six, eight, or ten stamens, the filaments extending beyond the anthers in awl-shaped points; the ovary free, 3—5-celled, with numerous ovules; the fruit succulent. The order is characterized by narcotic properties. The genus *Paris* (q. v.) belongs to it.

TRI′LOBITES, an order of fossil crustacea entirely confined to the palæozoic rocks. They are specially abundant in the Silurian period, and disappear in the lower members of the coal-measures.

The body was covered with a chitinous shield, which consisted of a large united cephalic shield, a variable number of body segments, and a tail or pygidium, composed of a number of joints, more or less anchylosed. The eyes were sessile and compound. The lenses are frequently beautifully preserved, and in some species are so large that they can easily be seen with the naked eye. In *Asaphus caudatus*, each eye had at least 400 facets; and in the large *A. tyrannus*, it is estimated that there are no fewer than 6000.

In some species, a bifurcated plate has been found in the region of the mouth, which is believed to be a labrum, but no antennæ or limbs have been yet detected in any specimen. They may have been entirely destitute of attennæ, as in some living animals to which they are nearly related these organs are very rudimentary; and their feet were probably soft and leaf-like appendages, bearing the gills, which would speedily perish, and leave no traces in a fossil condition. The sexes are believed to be indicated by variations in the length of the cephalic and caudal spines, and in the prominence of the head lobes. The members of the order varied greatly in size, some species being scarcely larger than a pin's head, while others, like *Asaphus gigas*, attained a length of 18 inches. It is probable that many named species may be only larval or transition forms of others. The minute *Agnosteus* is frequently found in such quantities as to indicate that it lived in shoals, as if it were the larval form of some large trilobite. Burmeister considers that trilobites have their nearest allies in the minute Phyllopoda, a section of entomostracous crustacea, which live in stagnant water, and are never at rest, but continually swimming at various depths on their backs, some being so near the surface of the water that their feet touch it. He consequently supposes that trilobites lived gregariously in shallow water close to shore, moved only by swimming near the surface, and could not creep at the bottom; that they swam in an inverted position, with the belly upwards; that they made use of their power of rolling themselves into a ball as a defence against attacks from above; and that they lived on smaller water-animals.

Asaphus tuberculatus.

About 400 species have been described, and grouped into 50 genera. Of these, 46 are Silurian, 22 Devonian, and 4 Carboniferous.

TRI′LOGY, the name given by the Greeks to a group of three tragedies, either connected by a common subject, or each representing a distinct story. A satyric drama was customarily added as a termination, whence the whole was sometimes termed a *tetralogy*. Every tragic poet that wished to take part in a poetic contest had to produce a trilogy along with a satyric drama at the Dionysiac, Lenæan, and Anthesteriac festivals. We possess only one perfect specimen of the classic trilogy—the *Oresteia* of Æschylus, which embraces the *Agamemnon*, the *Chœphoræ*, and the *Eumenides*. Beaumarchais' three comedies form a comic trilogy; Schiller's *Wallenstein* is a trilogy; and so are Swinburne's *Chastelard*, *Bothwell*, and *Mary Stuart*.

TRIMETHY′LAMINE, or TRIMETHYLIA, is a remarkable organic base, with an extremely powerful fishy odor. It is obtained as a colorless gas, readily soluble in water, and having a strong alkaline reaction. With acids, it readily forms soluble salts. It occurs in large quantity in the pickle in which herrings (especially their roes) have been lying, and in the spirit in which old anatomical preparations have been long suspended; and (strange as it may appear) it imparts to the leaves of *Chenopodium olidum* their atrocious odor, and to the flowers of *Cratægus oxyacantha* (the common hawthorn), their agreeable fragrance. It is obtained by distillation from ergot of rye, from guano, the juice of the leaves of red beet-root, and from putrid yeast, and has been detected in small quantity in human urine and in the blood of the calf. It may be formed artificially by the action of iodide of methyl on dimethylamine; but the source from which it may most readily be derived is herring-brine.

TRIMMER, a political term in use in the reigns of Charles II. and William III., originally applied to certain politicians of Charles's time, of whom the chief was Charles Montagu, Earl of Halifax, who held opinions half-way between the extreme Whigs and Tories. Halifax adopted the name Trimmer as a title of honor, maintaining that everything good was a medium between extremes.—The same term was applied more generally by Dryden and other writers of the same period to all who, professing to be friends to monarchy, were at the same time enemies to the Duke of York, and who were equally obnoxious to the court and to the fanatical republicans.

TRIMMER, Mrs. Sarah, was born at Ipswich on 6th January 1741. Her father was a Mr. Joshua Kirby, a man of intelligence

and piety, who removed to London about 14 years after, and became tutor to the Prince of Wales, afterwards George III., in the science of perspective, a subject in connection with which he was favorably known by several ingenious works. Among other distinguished persons with whom his daughter had now the advantage of meeting, was the great Dr. Johnson, with whom she speedily became a favorite. In 1759, her father was appointed Clerk of the Works at Kew Palace, whither he went to reside; and here Miss Kirby became acquainted with Mr. Trimmer, to whom, in 1762, she was married. It was not till the year 1780 that she came before the world as an authoress, by the publication of her *Easy Introduction to the Knowledge of Nature*, intended for the use of young people. The success of this little work encouraged her to further efforts in the same field; and during the next few years, she issued in succession six volumes of *Sacred History, selected from the Scriptures, with Annotations and Reflections adapted to the Comprehension of Young Persons.*

Her next work was the *Economy of Charity*, addressed to benevolent people of her own sex, which went through several editions. She edited subsequently in succession *The Family Magazine*, and the *Guardian of Education;* a selection of her contributions to the first of which was issued under the title of *Instructive Tales:* her chief papers to the other being collected in the volume published after her death as *An Essay upon Christian Education.* Besides this, she labored assiduously in the preparation of school-books for the Society for Promoting Christian Knowledge, intended to supersede the imperfect manuals then in use; and did much miscellaneous work of a somewhat cognate kind. She died quite suddenly on Dec. 15, 1810. Her works for the young, though now for the most part superseded, were excellently adapted for their purpose, and for a long time had an extensive popularity. Her *History of the Robins* is still a favorite.

TRIMURTI (from the Sanscrit *tri*, three, and *mûrti*, form) is the name of the Hindu triad, or the gods *Brahman* (masculine), *Vishn'u* and *S'iva*, when thought of as an inseparable unity, though three in form. The *Padma-Purân'a* (see PURAN'A), which, being a Purân'a of the Vaishn'ava sect, assigns to Vishn'u the highest rank in the T., defines its character in the following manner: 'In the beginning of creation, the great Vishn'u, desirous of creating the whole world, became three-fold: creator, preserver, and destroyer. In order to create this world, the supreme spirit produced from the right side of his body himself as Brahman; then, in order to preserve the world, he produced from the left side of his body Vishn'u; and in order to destroy the world, he produced from the middle of his body the eternal S'iva. Some worship Brahman, others Vishn'u, others S'iva; but Vishn'u, one, yet threefold, creates, preserves, and destroys; therefore, let the pious make no difference between the three.' And the *Matsya-Purân'a*, where speaking of *Mahat*, or the intellectual principle of the Sânkhya philosophy (see SANKHYA), says that 'Mahat becomes distinctly known as *three* gods, through the influence of the three qualities, goodness, passion, and sin; being one person and three gods—viz., Brahman, Vishn'u, and S'iva.' Apart, therefore, from sectarian belief, which makes its own god the highest, and gives him the attributes also of the other gods, *Trimûrti* implies the unity of the three principles of creation, preservation, and destruction, and as such belongs more to the philosophical than to the popular belief. When represented the T. is one body with three heads: in the middle, that of Brahman; at its right, that of Vishn'u; and at its left, that of S'iva. The symbol of the T. is the mystical syllable *om*, where (*o* being equivalent to *a* + *u*) *a* means Brahman; *u*, Vishn'u; and *m*, S'iva. See OM.

TRINCOMALEE', a seaport town and magnificent harbor on the north-east coast of Ceylon, in 8° 34' N., and 81° 12' E. The town is built on a bold peninsula, which divides the inner and outward harbors. It is a place of great antiquity, but its ancient renown was due more to religious than political or geographical considerations, for it was here that the Malabar invaders of Ceylon built one of their most sacred shrines—the 'Temple of a Thousand Columns,' to which pilgrims flocked from all parts of India. This celebrated shrine was demolished by the Portuguese, who fortified the heights with the materials derived from its destruction, 1622 A.D. It was next held by the Dutch; but in 1672, during the rupture between Louis XIV. and the United Provinces, the French took T., which was abandoned by the Dutch in a panic.

In 1782, the French admiral, in the absence of the British commander, took possession of the fort, and the English garrison retired to Madras. It was restored to the Dutch the following year, and they retained it until the capture of Ceylon by the British in 1795. The modern town is in no way remarkable, and, with the exception of the official buildings, makes a poor appearance. There are Hindu temples in barbarous taste, and religious festivals and processions to which a similar epithet may be applied. The Bay of T. is land-locked, and presents a scene of tranquil beauty; its fine expanse of water is still as an inland lake, and equally sheltered. 'On comparing this magnificent bay,' says Sir J. E. Tennent, 'with the open and unsheltered roadstead of Colombo, and the dangerous and incommodious harbor of Galle, it excites an emotion of surprise and regret that any other than Trincomalee should have been selected as the seat of government and the commercial capital of Ceylon. As a harbor, Trincomalee is renowned for its extent and security; but its peculiar superiority over every other in the Indian seas consists in its perfect accessibility to every description of craft in every variation of weather.' The mean temperature for the year at T. is 81°·4. Pop. about 15,000.

TRINCOMALEE WOOD. See HALMALILLE.

TRING, a town of Hertfordshire, England, 32 miles north-west from London, near the right bank of the Ouzel, a branch of the Ouse. It is a neatly built town; has manufactures of silk, canvas, and straw-plait, and is a station on the London and North-western Railway. The Grand Junction Canal passes not far from it. Pop. (1871) 4045; (1881) 4354.

TRI'NGA. See SANDPIPER.

TRINIDA'D, an island belonging to Great Britain, and the most southerly of the West India Islands, being in latitude 11° north. It is about 50 miles long, varying in breadth from 30 to 35 miles, and the area amounts to 1755 square miles. It is separated from the mainland (Venezuela) by the Gulf of Paria, and the extreme points on the west coast are only 13 and 9 miles respectively from it. The Dragon's Mouth entrance, to the north, is the deepest channel to the harbor; and the southern, or Serpent's Mouth, is shallow, owing to the deposits brought down by the Orinoco. The gulf itself is shoaling up from the same cause. The aspect of the island of T. is different from that of the Caribbean Islands generally: the mountains are not so lofty, and they extend in an east and west direction along the northern coast, clothed with stately forests, and their margins fringed with overhanging mangroves, dipping into the sea. From the double-peaked mountain called Tamana, are seen the lovely and fertile valleys and plains with which the other part of the island abounds. The island has several good harbors, and some tolerably large rivers.

The chief town, Port of Spain, is one of the finest towns in the West Indies. It was originally built of wood, but was burned down in 1808, and the town has since been rebuilt of the good stone procured in the neighborhood. The streets are long, wide, well-paved, clean, and shaded with trees. There is another town called San Fernando, with two or three pretty villages.

A remarkable phenomenon is a pitch lake near the village of La Brea, composed of bituminous matter floating on the surface of fresh water, about 3 miles in circumference, and 80 feet above the sea. The mineralogy of the island is but little known. The soil is very rich and productive. The climate is hot and moist; the thermometer ranges from 75° to 85°, and sometimes 90°; and the rain-fall is about 75 inches.

The most important products are cocoa, sugar, rum, molasses, coffee, cotton, arrow-root, cocoa-nut, oil, hides, &c. The value of the exports in 1880 was £2,185,512; imports, £2,382,632. The trade is mainly with the United Kingdom, the exports thither in 1880 having a value of £1,163,791; the imports thence, £830,799. Pop. (1871) 109,638; (1881) 155,128, the increase being occasioned principally by the voluntary immigration from the neighboring colonies and from India. T. is a crown colony, ruled by a governor, an executive council of 3, and a legislative council of 13 members. The first railway in T., from Port of Spain to Arina, was opened in 1876.

T. was first discovered by Columbus in 1498, and thus named by him because three mountain summits were first seen from the mast-head when discovered; but no permanent establishment was founded there until 1532 by the Spaniards. In 1783, it first fell into the hands of the British, who were confirmed in possession of it in 1802.

TRI'NITY, a river of Texas, U. S., formed by the union of two streams, West Fork and Elm Fork, which rise near the northern boundary of the state, and unite 150 miles south-east, the main stream flowing thence 550 miles in the same general direction to Galveston Bay, about 40 miles north of the city of Galveston. It is navigable 300 to 500 miles.

TRINITY, a river of California, rising near the coast-range, and flowing through a country of rich gold-mines, into the Klameth River.

TRINITY, THE DOCTRINE OF THE, is the highest and most mysterious doctrine of the Christian religion. It declares that there are three Persons in the Godhead, or divine nature—the Father, the Son, and the Holy Ghost, and that 'these three are one true, eternal God, the same in substance, equal in power and glory—although distinguished by their personal properties.' The most elaborate statement of the doctrine is to be found in the

Athanasian Creed, which asserts that 'the Catholic faith is this: That we worship one God as Trinity, and Trinity in Unity—neither confounding the persons nor dividing the substance—for there is one person of the Father, another of the Son, and another of the Holy Ghost. But the Godhead of the Father, and of the Son, and of the Holy Ghost is all one; the glory equal; the majesty co-eternal.'

It is admitted that the doctrine is not found in its fully-developed form in the Scriptures; but it is supposed to be clearly revealed in its elements in the New Testament, and also to be indicated in many of the statements and revelations of the Old Testament. The form of expression in speaking of God in the Old Testament Scriptures—the plural *Elohim*, coupled with a singular verb; the apparent distinction recognized in the revelations to the Patriarchs and Moses between Jehovah and 'the Angel of Jehovah;' the mode in which 'the Spirit' and 'Word' of God, and 'Wisdom' (Proverbs viii.) are spoken of; and the gradual unfolding of the doctrine of a 'Messiah,' are all supposed to be indications from the earliest times of the truth of a plurality of persons in the Godhead; and in the New Testament Scriptures the doctrine is represented as clearly taught in the Trinitarian formula of baptism—the general character of the claims and prerogatives of Jesus Christ, especially the ascription to Him of the designation 'the Son of God,' and in the functions attributed to the Holy Spirit. The evidence is held conclusive of the equal divine nature and yet distinct personality of the Son and the Spirit along with God the Father. It is generally conceded, however, that the Christians of the 2d. and even of the 3d c., were far from having a clearly understood and recognized doctrine on this high subject. They were content for the most part to use Scriptural expressions in speaking of the Father, and the Son, and the Spirit, without defining articulately their relation to one another.

It was not till the progress of opposing heresies sought, on the one hand, to degrade the divine dignity of Christ (Ebionitism in its various forms, and Arianism); or, on the other hand, to confound the personality of Christ with God the Father—a heresy known in its special form as Patripassianism—that the church was led to define in the Nicene Creed the relation of the Son to the Father; and further, in the Nicæno-Constantinopolitan Creed, the relation of the Spirit to the Father. This creed was specially directed against the opinions of Arius. A further clause was afterwards added, known as the *filioque* clause, which determined the procession of the Spirit from the Son as well as the Father; but this clause, and the doctrine which it embodies, was never accepted by the Eastern Church, to whose finer speculative genius is owing the determination of the controversies which began in the 3d c. regarding the Divine nature. The Western or Latin Church had a far less refined genius for such speculations; and in so far as it meddled with them, has imparted to them a coarser and more contradictory aspect. What is known as the 'Athanasian Creed,' which is now well understood to be of Latin, and not of Greek origin, is a sufficient illustration of this.

It is not our part here to criticise the evidence for the doctrine of the Trinity, or the validity of the doctrine itself; it is enough to say that the evidence which we have briefly sketched in outline, has been accepted as satisfactory, not only by the Roman Catholic and oriental communions, but also by all the great Protestant communions. The only exception in modern times to the reception of the doctrine is in the case of the Socinians or Unitarians, who occupy in their teaching very much the position of the ancient Humanitarians (Ebionites). They reject the doctrine of the Trinity as incredible, and regard Christ merely as a higher prophet. There have, however, been various thinkers within the Christian church, such as Dr. Samuel Clarke in the beginning of last century, who, while accepting generally the doctrine of the Trinity, have rejected the special terms in which it is defined in the Creeds, and whose views have been known as semi-Arianism.

TRINITY COLLEGE, Cambridge, was founded by King Henry VIII., in 1546, upon the site, and partly out of the revenues, of several more ancient foundations. The names of these were King's Hall, Michael House, Fyswicke's Hostel, Hovinge Inn, Gregory's, Margaret's, Catherine's, Gerard's, and Tyler's hostels. Of these, the first two deserve special mention. King's Hall (*Aula Regis*) was so called after its founder, Edward III., whose father, Edward II., had maintained 32 scholars, called king's scholars, but had died before completing his intentions. The Hall was founded in 1337. The master's stipend was fourpence, and that of each scholar twopence, per day, with two robes at Christmas. The revenues of King's Hall at the time of its surrender to Henry VIII. amounted to £214 per annum.

Michael House was founded 1324 A.D., by Hervey de Stanton, who was Chancellor of the Exchequer to Edward II. He dedicated his college to the Trinity, the Virgin Mary, St. Michael the Archangel, and All Saints. When Henry VIII. united these smaller foundations into the one great college, henceforth called TRINITY COLLEGE, besides other endowments, he added the estates of twenty-seven dissolved monasteries, which made up the gross revenues to about £1700 per annum. Queen Mary added very largely to these benefactions, and provided for 20 additional scholars, 13 poor scholars or sizars, 4 chaplains, and a choir. Queen Elizabeth gave to the college a new set of statutes, by which the college was governed until the reign of Queen Victoria, when these statutes were revised. Subsequently, under the Cambridge University Commission (1859—1860), new statutes have again been given, by which several important changes have been introduced. Such Fellows as fill the office of bursar, tutor, or lecturer in the college, or professor in the university, are exempt from the necessity of taking holy orders, which must otherwise be done by all Fellows within seven years of taking the degree of Master of Arts. Marriage also is permitted to Fellows in a few exceptional cases, and to the chaplains and librarian. The Master of the college must be in holy orders, and the appointment is in the gift of the crown. The following are some of the more eminent names in the list of Masters: John Whitgift, who was raised to the see of Worcester; Thomas Nevile, Dean of Canterbury, who built the greater part of the cloistered court known by his name: he died 1615. To Dr. Barrow, who was made Master in 1672, the college owes the finishing of Nevile's Court, and the erection of the Library, for which the designs were furnished by Sir Christopher Wren. The famous Dr. Bentley was Master from 1700 to 1742.

The late William Whewell was one of the most distinguished men that this college has produced, and one of the best of its Masters. He was a munificent benefactor to the college, to which he added one new court during his life; and at his death bequeathed his large fortune to the building of another, and to the founding of a professorship of International Law. See WHEWELL. To these may be appended the following few names of popular interest, with the dates of their death: Lord Bacon, 1626; Sir Edward Coke, 1634; Cowley, the poet, 1667; Lord William Russel, executed 1683; John Dryden, 1701; Samuel Pepys, the diarist, 1703; SIR ISAAC NEWTON, 1727; Richard Porson, 1808; Lord Macaulay, 1859. Of living men, it will not be invidious to select only the names of Alfred Tennyson, the Laureate, and Professor H. A. J. Munro, editor of *Lucretius*.

The foundation now consists of a Master, sixty Fellows, and seventy-four Scholars. The present Master is the Rev. William Hepworth Thompson, D.D.

With the exception of the Hall and the Library, the college buildings are not of any architectural pretensions. The statue of Newton by Roubiliac, in the ante-chapel, is one of the finest modern statues.—See Cooper's *Annals and Memorials of Cambridge;* Dyer's *History;* and the *University Calendar*. The judges, when on circuit, have the right of being entertained at this college.

TRINITY COLLEGE, Oxford. In 1290, Richard de Hoton, Prior of Durham, founded Durham College at Oxford, for the education of the student-monks of Durham. At the dissolution of the monasteries, the property of this institution was transferred by Henry VIII. to the newly erected chapter of Durham Cathedral. Its site and buildings, however, passed into the hands of Sir Thomas Pope, who, in 1554, obtained a license from Philip and Mary to found a college on the spot, to be called T. C., for the maintenance of 20 scholars, of whom 12 were to be Fellows, and 8 scholars, properly so called. The scholars were to be elected from the founder's manors, and the Fellows from the scholars. In 1557, Sir Thomas Pope added four scholarships; and about the same time another was added by a Mr. Blount. There are also two exhibitions. By the ordinances issued by the commissioners under 17 and 18 Vict. c. 81, the fellowships and scholarships are thrown open without restrictions; the latter are tenable for 20 terms, value £80 a year, besides rooms. This is the first college, after Balliol, which was founded by a layman, as were all colleges subsequent to this date. It is also remarkable as having been, like St. John's, founded by a Roman Catholic after the Reformation. It presents to 11 benefices.

TRINITY HALL, Cambridge. This college, which is distinct from Trinity College, was founded 1349—1350 A.D. for Scholars of Canon and Civil Law, as well as for the education of clergy, by William Bateman, Bishop of Norwich, who was also co-founder of Gonville and Caius College. It appears that the bishop was induced to found the college in consequence of the great pestilence which had recently swept away most of the clergy of his diocese, so that there could not be found sufficient to supply the parochial cures. In a bull of Pope Clement VI., dated at Avignon, 1349, it is stated that there were at that time no less than 1000 parishes in the diocese void of incumbents. The first Master was Robert de Stratton. There are thirteen fellowships, of which ten may be held by laymen for ten years, and are not vacated by marriage. There are also five law-studentships, sixteen scholarships, and two exhibitions.—See Cooper's *Memorials and*

Annals, and Dyer's *History of Cambridge;* also the *University Calendar*.

TRINITY HOUSE (properly called, The Corporation of the Elder Brethren of the Holy and Undivided Trinity), a corporation intrusted with the regulation and management of the light-houses and buoys of the shores and rivers of England. In 1518, a society under the above name was founded at Deptford by Sir Thomas Spert, Knight, and incorporated by Henry VIII. Its privileges were confirmed in 1658; and in 1680, its first light-house was erected; all the light-houses which had previously existed on the English coast having been built by private individuals under patents from the crown. By 6 and 7 Will. IV. c. 79, and the Merchant Shipping Act, 1854 (17 and 18 Vict. c. 104), private rights in light-dues were abolished, and the exclusive right of lighting and buoying the coast committed to the Board of Trinity House. The power of Trinity House to appoint and license pilots for the English coast is also regulated by this last-named statute. The Cinque Ports pilots, who had formerly been under control of a separate society, were, by 16 and 17 Vict. c. 129, and the Merchant Shipping Act, 1854, placed under the jurisdiction of Trinity House. Trinity House was in the practice of distributing certain funds arising from light and pilotage dues, and from the sale of ballast, for certain charitable purposes; but the right which the society possessed to the surplus of light-dues was done away with by the Merchant Shipping Act 1854. This same act gave Trinity House a general supervision over the Commissioners of Northern Lights and the Ballast Board of Dublin, the corporations which have the charge of the light-houses and buoys of Scotland and Ireland respectively, subject to an appeal to the Board of Trade, to whose general superintendence Trinity House is also subject in matters relating to England. The light-houses of the Isle of Man are, by special arrangement, under the charge of the Commissioners of Northern Lights.

The corporation of Trinity House consists of a master, a deputy-master, nineteen acting elder brethren, eleven honorary elder brothers, and an unlimited number of younger brethren. The master and honorary elder brethren are chosen on the ground of eminent social position. The younger brethren all belong either to the naval service or the mercantile marine, and are admitted by the court of elder brethren. The deputy-master and acting elder brethren are elected by the court of elder brethren from such of the younger brethren as are possessed of the qualifications of having obtained the rank of commander in the navy four years previously, or having served as master in the merchant service on foreign voyages for at least four years. The Board discharges its duties by means of committees and sub-committees for special purposes, whose proceedings are, when necessary, subject to confirmation by the general court. Two elder brethren of Trinity House assist the Court of Admiralty at the hearing of every suit for collision, and occasionally in suits for salvage. Their duty is to guide the court by advice only; though influential, their opinion is not legally binding on the judges. The gross income of Trinity House greatly exceeds the expenditure. The surplus income is chiefly devoted to the extinction of the debt incurred in pursuance of the act of 1846 for the purchase of private rights in light-houses.

TRINITY SUNDAY, the Sunday immediately following Pentecost Sunday, so called as being set aside for the special honor of the Blessed Trinity. The date of the origin of this festival has been a subject of much controversy. No such festival as Trinity Sunday was known to the Fathers of the early centuries. The most decisive evidence of its non-acceptance by the general church up to the 9th or 10th c., is the absence even to this day of any corresponding festival in the separated Greek Church; and although it seems quite certain that the festival was introduced in certain particular churches of the West, at earlier and varying dates, the general establishment of Trinity Sunday as a common festival of the whole Western Church, dates from a decree of John XXII., who died in 1334. Nevertheless, the mass and office peculiar to the day are of much greater antiquity, and may be traced, at least in part, in several sacramentaries and other liturgical books of the earlier centuries.—See Benedict XIV., *De Festis*, i. 2, 10; Binterim, *Denkwürdigkeiten Christ-katholisch. Kirche*, vol. v. part 1.

TRINO'DA NECE'SSITAS, three species of contributions, to which, in Anglo-Saxon times, all the lands of England, whatever their tenure, not excepting those of the church, were subject; viz., *Bryge-bot*, for keeping the bridges and highways in repair; *Burg-bot*, for keeping the fortresses in repair; and *Fyrd*, for maintaining the military and naval force of the kingdom.

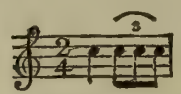
TRI'O, in Music, a composition for three voices or for three instruments. The same term is also applied to a movement in ¾ time in a different key, which follows a minuet or other movement, and always leads back to the previous movement in the original key.

TRIPE DE ROCHE, a name originally given by the Canadian hunters to certain lichens, species of *Gyrophora*, which they are often forced to use as food, and now very generally in use as the designation of these plants. They are nutritious, but bitter, nauseous, and purgative. They have a leafy peltate thallus, variously lobed and notched—in *G. proboscidea* of a smoky-brown color, and in *G. erosa* almost black; the shields are round, without stalks, covered with a black membrane, and marked with circles and plaits upon the surface. These lichens grow on rocks in northern regions, or on high mountains. They are to be found in abundance in Spitzbergen, and a species, well known as a native of the Scottish mountains, is found in the Himalaya at an elevation of more than 18,000 feet.

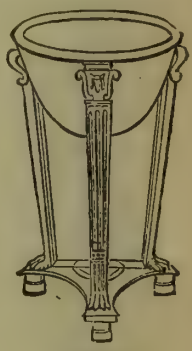
TRIPIT'AKA. See PIT'AKA.

TRIPLE ALLIANCE, the name by which two different treaties are known in history; viz. 1. A treaty concluded in 1668 at the Hague between England, Holland, and Sweden, having for its object the protection of the Spanish Netherlands, and the checking of the conquests of Louis XIV. 2. An alliance concluded in 1717 between Britain, France, and Holland against Spain, which included among its stipulations that the Pretender should quit France, and that the treaty of Utrecht should be carried into effect as regards the demolition of Dunkirk. The Protestant succession was guaranteed by this treaty in England, and that of the Duke of Orleans in France.

TRI'PLET, in Music. When a note is divided into three in place of two parts—as when a minim is divided into three crotchets, a crotchet into three quavers, &c.—the group is called a triplet, and it is usual to place the figure 3 over it. Thus—



TRIPOD (Lat. *tripos*, Gr. *tripous*, three-footed), any article of furniture supported on three feet. Three-legged caldrons and bronze altars more especially came under this denomination in classical times; many of them are of exquisite workmanship, and richly decorated. The sacrificial tripod in its earliest form resembled the caldron, with the addition of three rings at the top to serve as handles. Of this description seems to have been the tripod at Delphi, from which the Pythian priestess delivered her oracles, with the addition, however, of a round flat plate on the top, on which the priestess sat while giving the response, while a laurel wreath lay on it at other times. Tripods of a similar form were given as prizes at the Pythian games; and at Athens, a tripod was considered an appropriate reward for a successful choragus. Some beautiful tripods were found at Pompeii; and there are several very interesting specimens in the British Museum. Analogous to the classic tripod, is Thor's *kettle* in Scandinavian mythology, which was probably the origin of the witches' caldron.



Tripod.

TRI'POLI, or TRIPOLIS (in its modern Arabic form, *Tarâbulus*), the ancient *Tripolis*, a seaport, and one of the chief commercial towns of Syria, capital of a pashalic in the eyalet or government of Sidon, is situated near the coast, on the eastern border of a small triangular plain running out into the Mediterranean, and on both sides of the river Kadisha. The town is substantially built of stone, with many remains of medieval architecture, and is supplied with excellent water by an aqueduct. It is surrounded by gardens of orange, lemon, mulberry, apricot, and other fruit trees, which are planted also in the town itself, and give the place a rich and picturesque appearance; but the low marshy neighborhood renders it unhealthy. On the left side of the river stands the castle built by Count Raymond of Toulouse, in the 12th c., when the city was taken by the Crusaders. At the north-west apex of the plain already mentioned lies the port of Tripoli, called El-Mîna (the landing-place), or the Marina, a small fishing village about 1½ miles distant from the town. The harbor, like other harbors on the Syrian coast, scarcely deserving of the name, is formed by a line of low rocky islets stretching north-west from the point. The trade of the place has of late much declined, being superseded by that of Beirût; its exports now consist chiefly of silk, sponges, and tobacco: there are also manufactures of soap. Pop. variously stated at 13,000 and 20,000, and consisting of Mohammedans and Greek Christians. It is the see of a Greek bishop. T. is regularly visited by the steamers of the French Messageries.

The ancient city of T. was situated on the plain, where immense numbers of granite shafts and other relics of antiquity are still

found. Its name (the *Three Cities*, or the *Triple City*) was derived from the circumstance of its being founded by the cities of Tyre, Sidon, and Aradus, as an entrepôt for trade, and a point of federal union. It was for many centuries a place of great commercial importance.

TRIPOLI, a regency of the Ottoman Empire, and the most easterly of the Barbary States, North Africa, is bounded on the W. by Tunis, on the S. by the Libyan Desert and Fezzan, on the E.—if we include the plateau of Barca (q. v.)—by Egypt, and on the N. by the Mediterranean. Area roughly estimated at 200,000 sq. m.; pop. uncertain, but believed to be about 1,000,000. T. is less mountainous than the rest of Barbary, the Atlas range terminating here in a couple of chains running parallel to the coast, and never exceeding 4000 feet in height. There are no rivers in the country, and rain seldom falls during the long hot summers, but the dew is copious, and supports vegetation in favored spots. The coast region (about 1100 miles in length) is very fertile about Tripoli and Mesurata, where all sorts of tropical fruits, grain, wine, cotton, madder, &c., are produced; but further east, along the shores of the Gulf of Sidra, sandy desolation reigns. The interior yields senna, dates, and galls; the carob and lotus are indigenous.

Sheep and cattle are reared in great numbers, and T. is also noted for its small but excellent horses, and its strong and beautiful mules. The commerce of the country consists in exporting, principally to Malta and the Levant, the products of the country and of the interior of Africa (gold-dust, ivory, natron), which are brought hither in caravans across the desert. The imports (which consist chiefly of European manufactures) have been declining gradually of late years, owing mainly to two causes. The *first* is the new direction which the trade of Central Africa is assuming. By the Niger and its great tributary, the Benue, European manufacturers are more rapidly and more economically conveyed to the northern intertropical regions than by the tedious overland route of the Great Sahara. The *second* cause is the abolition of the slave-trade, which, of course, has stopped the demand for all the commodities that alimented the traffic.

T. is subdivided into four *livas*, or provinces—Tripoli, Benghazi, Mesurata, and Gadames. The governor-general has the title, rank, and authority of a pasha of the Ottoman Empire. He is appointed by the sultan, and in his turn appoins the subordinate governors of the Tripolese provinces, who bear the title of beys. The military force of the country consists of a body of Turkish soldiers, some 10,000 in number, whose business is to keep down insurrections, but who were formerly wont to vary it by by creating them. The natives (who comprise Libyan Berbers, Moors, and a few Arabs) pay to the imperial government, by way of tribute, a tenth of all the products of the soil; and there is, besides, a special tax imposed on every olive tree and date tree, on every camel, on all horned cattle, on sheep and goats, and on Jewish residents. Little wisdom and less justice are shown either in the imposition or collection of the taxes.

In ancient times, T. (when we first read of it) appears to have formed the most westerly portion of the territory of Cyrenaica (Barca), or at least to have been tributary to the Cyrenæans, from whom, however, it was wrested by the Carthaginians. It next passed to the Romans, who included it within the province of Africa, and gave it the name of *Regio Syrtica*. About the beginning of the 3d c. A.D., it became known as the *Regio Tripolitana* (on account of its three principal cities, Œa, Sabrata, and Leptis, which were leagued together; whence its present name Tripoli), and was probably raised to the rank of a separate province by Septimius Severus, who was a native of Leptis. Like the rest of North Africa, it was conquered by the Arabs (see Barbary), and the feeble Christianity of the natives was supplanted by a vigorous and fanatical Mohammedanism. In 1552, the Turks got possession of it, and have ever since been the rulers of the country, though the authority of the sultan, up till 1835, had been virtually at zero for more than a century. In that year, however, an expedition was despatched from Constantinople; the ruling dey, Karamanli (in whose family the sovereignty had continued uninterrupted since 1714) was overthrown, and imprisoned; a new Turkish pasha, with vice-regal powers, was appointed, and the state made an eyalet of the Ottoman Empire. Several rebellions have since taken place (notably in 1842 and 1844), but they have always been suppressed.

TRIPOLI, called by the Turks *Tarabúlús*, and probably the *Œa* of antiquity, the capital of the foregoing state, lies on a bit of rocky land projecting into the Mediterranean, and forming a bay. It is surrounded by high walls with bastions, and is irregularly built, but has beautiful gardens. There are 12 mosques, 3 synagogues, and 2 Christian churches. Pop. about 24,000. Though the majority are Moslems, nearly all the trade is in the hands of Jews and Christians. The overland trade to Sudan has greatly fallen off. The exports have an annual value of about £500,000.

TRIPOLI (*Tarabúlús*), a seaport of Syria, is 40 miles N.N.E. of Beyrout. The houses are mostly of stone. In and around the town are many remains of antiquity and traces of middle-age architecture. Originally an important maritime city of Phœnicia, the ancient *Tripolis* was besieged and taken by the Crusaders in the 12th century. The harbor is small and shallow. Fruit is exported to the annual value of £120,000; also oil, grain, silk, tobacco, and sponges. Pop. (chiefly Greek) about 25,000.

TRIPOLI, a mineral substance employed in polishing metals, marble, glass, &c., so named because it was originally brought from Tripoli in Africa. It is a siliceous rock, composed of very minute particles, somewhat loosely held together, so as to yield readily to the nail, and to crumble down in water like rotten-stone. It has a coarse, dull, earthy fracture, is rough to the touch, and is of a gray, yellow, or red color. The particles which entirely compose it are the siliceous frustules of *Diatomaceæ*, which occur unaltered in it, and are united together without any visible cement. Ehrenberg estimated that every cubic inch of Bilin Tripoli weighing 220 grains, contained 41,000,000,000 of these minute waterweeds. Deposits of Tripoli occur in the Tertiary rocks in every quarter of the world.

TRIPOLI'TZA ('three cities'), a town of Greece, under the Turkish rule capital of the Morea, now the chief town of the government of Mantinea, lies 22 miles south-west of Argos, and 39 south-west of Corinth, in a plain 3000 feet above the sea. It derives its name from being near the sites of the three ancient cities, Tegea, Mantinea, and Pallantium. In 1821, it was stormed by the Greek insurgents; and in 1828 razed to the ground by the troops of Ibrahim Pasha; it has since, however, been rebuilt. Previous to 1821, it had 20,000 inhabitants; in 1879 the pop. was 10,057.

TRI'PPANT, in Heraldry, a term analogous to Passant (q. v.) but applied to animals of chase.

TRI'PTYCH (Gr. *tris*, thrice, and *ptysso*, I fold), a set of tablets consisting of three leaves, each painted with a distinct subject, but joined together by hinges, and capable of being folded so as to present a new face. The general character of such tablets has been explained under DIPTYCH (q. v.), the difference of name, 'triptych,' 'polyptych,' being taken from the number of the leaves. In ecclesiastical use, the diptych has been already explained as commonly meaning rather the register of names inscribed on the tablets than the tablets themselves. The triptych, on the contrary, generally speaking, contained sacred pictorial representations rather than written registers or records.

TRI'REME (from *tres*, three, and *remus*, an oar) is the designation given in ancient times to a galley having three banks of oars. It is said to have been first employed by the Corinthians in their war with Corcyra, 664 B.C. In the Persian and Peloponnesian wars, triremes were the largest vessels employed; but at the time of Alexander, we find that galleys, with four and five banks had gradually come into favor. In the Punic wars, the Carthaginians generally employed quinqueremes; and as the Roman triremes could have no chance against vessels with such high bulwarks, the Romans henceforth constructed their war-vessels after the model of the Carthaginian quinquereme.

The banks of oars were elevated above each other, but not perpendicularly; and the lowest rank of rowers having the shortest oars and easiest work, had the least pay. The trireme or quinquereme was also provided with a square sail, which was used when the wind was favorable for voyaging, to relieve the labor of the rowers, but it was not employed in action. The crew consisted of about 200 men; and on a smooth sea, in speed and accuracy of manœuvring, the trireme was little inferior to a modern steamboat. In the earlier times, before the Persian war, and even later, victory depended more upon the number and valor of the soldiers on board, than upon the skill of the seamen. Herodotus mentions that besides the crew there were 40 marines serving on board each Ionian trireme. The Athenians improved this system by decreasing the number of fighting men, and trusting more to the skilful management of their vessels. In a fight, the aim of each trireme was not, as before, to grapple with its opponent, but to dash with the greatest momentum possible with its beak against the enemy's vessel, and strike it amidship, or, at any rate, disable his banks of oars on one side. Fighting men were not so much wanted for these tactics; and so we find later on, in the Peloponnesian wars, the number of marines in each ship reduced to ten. It is singular to see this system of ram-fighting coming once more into vogue. A contrivance for strengthening the prow of the trireme, and increasing its efficiency as a ram, gave the Syracusans their final victory over the Athenians in the harbor of Syracuse.

TRISA'GION, or TRISHAGION (Gr. *tris*, thrice, and *hagios*, holy; Lat. *tersanctus*, thrice holy), one of the doxologies in use in the Greeek Church, which is repeated in the form of versicle and responses by the choir in certain parts of the liturgy. The words of the Trisagion are: '*Hagios O Theos, Hagios Ischuros, Hagios*

Athanatos, eleison hemas!' (O Holy God, O Holy Mighty One, O Holy Immortal, have mercy on us!) This doxology, in its original Greek form, is one of the few fragments of the Greek liturgy which (like the *Kyrie Eleison*) are retained in the original language in the Roman mass. It occurs in the service of Good Friday in the procession and veneration of the cross. See GOOD FRIDAY.

TRISMEGI'STUS (Gr. Thrice-greatest), an epithet applied to the Egyptian Hermes (q. v.), or Thoth (q. v.) by the Neo-Platonists, and the devotees of magic, alchemy, and mysticism generally, who looked upon him as the source of all mysterious doctrines. See HERMETIC BOOKS.

TRI'SMUS NASCE'NTIUM is a form of lock-jaw occurring in newly-born children, in consequence mainly of impurity of the atmosphere. In Iceland, this disease annually carries off a large proportion of infants between the fifth and twelfth days after birth; in some parts, the mortality being nearly *two out of three*. It is also very frequent and fatal in the West Indies, where it is known as the 'ninth-day disease.' Another of its names is 'the jaw-fall,' from the circumstance of the jaw relaxing and dropping on the breast shortly before death. The complaint used to be common in hospitals when ventilation was less attended to than at present; but with the introduction of a better system of ventilation, the mortality has been very much reduced. In so fatal a disease, it is almost unnecessary to refer to treatment. Immediate removal to a pure air, a warm bath, and a dose of castor-oil should be tried.

TRISTAN DA CUNHA, an island in the South Atlantic Ocean, lies midway between the coast of South America and the Cape of Good Hope, in 37° 6′ S. lat. It is about 20 miles in circumference. In 1816, a company of British artillery was stationed on the island for the purpose of keeping a watch on Napoleon, at that time a prisoner in St. Helena, from which T. is distant about 1300 miles. On the death of Napoleon in 1821, the soldiers were withdrawn, with the exception of a corporal named Glass, and one or two companions, who were left in charge of the small fort that had been erected. These men finding the soil very fertile, proceeded to cultivate the island, and their efforts were attended with marked success; insomuch that they were enabled to carry on a brisk trade in the produce with any passing ships that might stand in need of fresh provisions. The colony flourished, and in 1829 numbered 27 souls. When visited by H.M.S. *Challenger* in October 1873, the place was found to be still thriving; the inhabitants numbered 80, and the cattle had increased to 600, with an equal number of sheep. In the vicinity of T. are two other islands—one of them, Inaccessible Island, 20 miles distant, possessing a special interest from the circumstance of its having harbored two Germans of the name of Stoltenhoff, who underwent a kind of Robinson Crusoe experience there. They were landed on this desolate island on November 27, 1871, when making their way to the larger island of T., and determining to settle there, experienced many privations, being sometimes reduced to great extremities; though, unlike Robinson Crusoe, they had more than one opportunity of quitting the island in the course of their two years' sojourn. They were at length, however, fain to take advantage of the opportunity afforded them by the *Challenger* of leaving the island, which they accordingly did on the 16th October 1873.

TRISTRAM is the hero of a British legend, which originally had no connection with the stories of King Arthur and the Round Table, although later minstrels sought to interweave them. Briefly, the legend goes as follows.

T., son of Rouland Rise, Lord of Ermonie, and Blanche Fleur, sister of Mark, king of Cornwall, having lost both parents at the period of his birth, is brought up for the first fifteen years of his life at the court of the monarch who had slain his father, after which he proceeds to Cornwall, and is acknowledged by his uncle, who appoints him his heir and successor. Having received a severe wound in a duel, he is cured by Ysolt or Ysonde, daughter of the queen of Ireland; and on his return to Cornwall, informs his uncle of the marvelous beauty of the Irish princess. Mark is charmed, and sends his nephew to Dublin, at the head of a select body of knights, to solicit her hand in marriage. The king's suit is successful, and T. escorts her on her voyage to England; but both having unwittingly partaken of a love-potion (which was intended for Mark), they are immediately inflamed with a criminal passion for each other, which is the source of all their subsequent misfortunes. Ysolt is married to the king of Cornwall; but, by the help of her clever maid, Brenqwain, she contrives to have numerous secret interviews with her lover, and for some years succeeds in allaying the jealousy and suspicions of her husband. At last, however, T. is banished from Cornwall, and goes to Wales, where he performs prodigies of valor. His uncle again becomes reconciled to him, and invites him back to his court, where the amours of the incorrigible lovers are renewed.

A renewed banishment is the consequence, and T. goes abroad to Spain, Ermonie, Brittany, in the last of which countries he marries another Ysolt, called, for distinction's sake, Ysolt *with the white hand*, daughter of the Duke of Brittany. In one of his exploits, he is desperately wounded, and can only be cured by Ysolt of Cornwall. He despatches a messenger to the princess, telling him that on his return he is to hoist a white sail as he approaches the coast of Brittany, if Ysolt accompanies him; but if not, a black sail. The Queen of Cornwall hastens to save her lover; and as the vessel nears the shores of France, T.'s wife, Ysolt *with the white hand*, recognizes the white sail, and, fired with jealous hate at the thought of a rival's approach, hurries to her husband's chamber, and tells him the messenger's ship is coming in with black sails spread. T., in an agony of disappointed love, sinks back and expires. When the queen of Cornwall lands, and hears of his death, she rushes to the castle, throws herself on his corpse, and dies beside him. King Mark subsequently learns the story of the love-potion, and buries the twain in one grave, planting over Ysolt a rose-bush, and over T. a vine, which grew up so inextricably intertwined that no man could ever separate them.

The popularity of the story in the middle ages was unbounded. The scene of the principal exploits, and the residence of the principal personages is Cornwall, from which one is disposed to claim a British or Welsh paternity both for the legend and the literature; and this is the view that underlies Sir Walter Scott's argument in behalf of the purity of the metrical version of *Sir Tristram* which he published (ed. 1806) from the Auchinleck MS., and which is considered to be the composition of Thomas the Rhymer (q. v.). As early as the middle of the 12th c., however, the legend had become a favorite throughout the whole of France; and it subsequently found its way into Spanish, Italian, German, Scandinavian, Slavic, and Greek literature. *Tristan und Isolde* is the subject of one of Wagner's operas. See Michel's *Tristan* (1835), and Bossat's (1865).

TRI'TICUM. See WHEAT and COUCH GRASS.

TRI'TON, in Greek Mythology, a son of Poseidon and Amphitrite, who dwells with his parents in a golden palace at the bottom of the sea. He usually figures as an attendant on his father, riding over the Mediterranean on a horse or other sea-monster, and soothing the turbulent waves by blowing his shell-trumpet—

Triton.

his 'wreathed horn,' as Wordsworth calls it. The later poets speak of Tritons, in the plural, as a race of subordinate sea-deities, who are described by Pausanias as having sea-green hair and eyes, gills below the ears, human noses, broad mouths with the teeth of animals, scales on their bodies, and instead of feet, a tail like that of a dolphin. They were frequently represented in works of art.

TRI'UMPH (Lat. *triumphus*) was the name given in ancient Rome to the public honor bestowed on a general who had been successful in war. It consisted in a solemn procession along the *Via Sacra* up to the Capitol, where sacrifice was offered to Jupiter. The victor sat in a chariot, drawn by four horses—his captives marching before, his troops following behind. Certain conditions had to be fulfilled before a triumph could be enjoyed, and it was the business of the senate to see that these were enforced. Under the Empire, generals serving abroad were considered to be the Emperor's lieutenants, and therefore, however successful in their wars, they had no claim to a triumph. They received instead *triumphal decorations* and other rewards.

The appearance that Rome presented on the occasion of a triumph, especially in later times, was joyous in the extreme. All work was suspended; the temples were thrown open, and decorated with flowers; the populace were clad in holiday attire, and crowded the steps of all the public buildings in the *Via Sacra*, and the forum, or mounted the scaffoldings erected for the purpose of viewing the procession; banquets were spread before every door. As for the *imperator* himself, after having pronounced a eulogy on the bravery of his soldiers, he ascended his triumphal car, entered the city by the *porta triumphalis*, where he was met by the senate, and now the procession began.

First marched the senate, headed by the magistrates; next came a body of trumpeters; then a train of carriages and frames laden

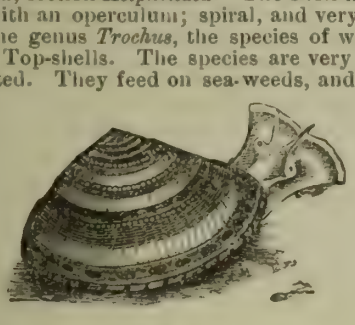
with the spoils of the vanquished; then a body of flute-players, followed by the oxen doomed to be sacrificed, and the sacrificing priests, &c.; then the distinguished captives with bands of inferior prisoners in chains; after whom walked the lictors of the imperator, having the fasces wreathed with laurel. Next came the hero of the day—the imperator, in a circular chariot, attired in an embroidered robe (*toga picta*) and flowered tunic (*tunica palmata*), bearing in his right hand a laurel bough, in his left, a sceptre, and having his brows garlanded with Delphic laurel. He was accompanied by his children and his intimate friends. His grown-up sons, the legates, tribunes, and equites, rode behind; and the rear was brought up by the rest of the soldiery, singing or jesting at their pleasure, for it was a day of carnival and license. When the procession had reached the Capitoline, some of the captive chiefs were taken aside, and put to death; the oxen were then sacrificed, and the laurel wreath placed in the lap of Jupiter. In the evening, the imperator was publicly feasted, and it was even customary to provide him a site for a house at the public expense.

The *ovation*, or lesser triumph, differed from the greater chiefly in these respects: that the imperator entered the city on foot, clad in the simple *toga prætexta* of a magistrate; that he bore no sceptre, was not preceded by the senate and a flourish of trumpets, nor followed by his victorious troops, but only by the equites and the populace, and that the ceremonies were concluded by the sacrifice of a sheep instead of a bull, whence, doubtless, the name *ovation* (from *ovis*, a sheep). The ovation, it is scarcely necessary to add, was granted when the success, though considerable, did not fulfil the conditions specified for a triumph.

TRIU'MVIRATE (Lat. a union composed of *three* men) is the name given in Roman history to the private league entered into between Pompey, Crassus, and Cæsar—the three most powerful men of their time; the object of which was to carry out their own schemes of political aggrandisement, in spite of the opposition of the senate. This compact was not a triumvirate, in the proper sense of the term: it had no legally constituted existence: it was, in fact, only a treasonable conspiracy of three men against the legitimate authority of the state. The term is less incorrectly applied to the division of government between Octavian (Augustus), Mark Antony, and Lepidus in the civil wars that followed the murder of Cæsar—an arrangement sanctioned, and therefore legalized by the senate. The former is usually called the *first*, the latter, the *second* triumvirate.

TRI'VIUM (Three Roads), the name given to the lower section of the Seven Liberal Arts (see ARTS), constituting the circle of study in the middle ages. It embraced Grammar, Logic, and Rhetoric.

TRO'CHIDÆ, a family of gasteropodous molluscs, of the order *Pectinibranchiata*, section *Asiphonata*. The shell has the aperture entire, closed with an operculum; spiral, and very generally top-shaped, as in the genus *Trochus*, the species of which are popularly known as Top-shells. The species are very numerous, and widely distributed. They feed on sea-weeds, and some of them



Trochus.

are found on rocks between high and low water mark. Many of them are very beautiful, and some of the small kinds are often employed to adorn headdresses, and for other ornamental purposes, the epidermis and outer layer being removed. Several species are frequent on the British shores. Some of the tropical ones attain a comparatively large size. The T. are very closely allied to *Turbinidæ*.

TRO'CHILUS AND TROCHI'LIDÆ. See HUMMING-BIRD.

TRO'GLODYTES (Gr. *Troglodytai*—Gr. *trogle*, a hole, and *dyo*, to get into; hence cave-dweller), the name given by the ancient Greeks to various tribes or races of uncivilized men, who dwelt either in natural caverns, or in holes which they had dug for themselves in the earth. They are mentioned by Strabo as existing as far west as Mauretania, and as far east as the Caucasus; but perhaps the best known T. of ancient times were those of Southern Egypt and Æthiopia, where a considerable district of country was called *Regio Troglodytica*. They could not speak articulately, but shrieked or screamed like the lower animals; though it ought always to be remembered that the Greeks, from whom we have such statements, are not very trustworthy authorities in the matter of language, accounting every dialect which they did not understand, a barbarous jargon.

The chief occupation of the T. was herding cattle, though we also read that they were hunters and robbers. They are likewise mentioned as serving among the light troops in the army of Xerxes. Their habits of life were rude and debased; they are reported to have eaten not only the flesh, but the bones and hides of their cattle; their drink is said to have been a mixture of milk and blood; and they had a community of wives. The wives tattooed their bodies; and the men, if not clothed in cattle-skins, went about *in puris naturalibus*. But the most revolting and unnatural of their practices was their treatment of the dead. They are reported to have bound the corpse neck and heels together, affixed it to a stake, pelted it with stones, amid shouts of laughter; and after they had buried it beneath a cairn of missiles, to have placed a horn on the top, and gone away!

What measure of truth there may be in such stories, it is now impossible to say; but archæological investigations into the prehistorical life of our own and other countries, have led to the conclusion, that a race of cave-inhabiters preceded in most countries the races that lived in houses built on the surface of the earth; and perhaps we shall not be far wrong if we regard Troglodytism as the primitive state of all, or the greater part, of mankind.

TROGO'NIDÆ, a family of birds, ranked by some naturalists, on account of their habits, in the order *Insessores*, and tribe *Fis-*

Resplendent Trogon (*Colurus resplendens*).

sirostres; but more generally, on account of the formation of the feet—two toes before, and two behind—placed in the order *Scansores*. The T. are remarkable for the beauty of their plumage, which is soft, full, and brightly colored. The bill is short, strong, with a wide gape; the tail generally long, in some species very long; the feet small, and in many, feathered almost to the toes. All the T. are tropical; they belong chiefly to the south-eastern parts of Asia, the Indian Archipelago, and South America. They abound most of all in South America. They inhabit forests, where they sit motionless on branches, waiting for insect prey, darting upon insects as they fly past. They make their nests in the hollows of decayed trees. Their flesh is highly esteemed for its delicacy and flavor. They are all of small size. In brilliancy of plumage, some of them are excelled by no birds except humming-birds.

TROIZK, a town of Eastern Russia, on the border of Siberia, in the government of Orenburg, stands on the Oug, 420 miles south-west of Tobolsk. It is the seat of considerable commerce, especially during the summer months, at which season a large trade is carried on with the Kirghis and the Bokharians, who arrive in caravans from Central Asia. Pop. (1880) 8298.

TROLLOPE, MRS. FRANCES, a novelist and miscellaneous writer of some eminence, was born in the year 1780. Her father was an English clergyman. In 1809, she was married to Mr. Anthony Trollope, a barrister-at-law. In 1829, she went to America; and during a three years' residence in the United States, amassed the materials of her first book, *Domestic Life of the Americans*, published in 1832. This work attracted great attention; and the severity of certain of its strictures was much resented by our sensitive cousins over the water. From this time forward, the literary activity of Mrs. T. was nearly uninterrupted, and her name became one of the more notable of the time. Novels of Society and Impressions of Travel make up the sum of her works. Of her novels, the most successful is, perhaps, *The Widow Barnaby*

(3 vols., 1839); with its sequel, *The Widow Married* (3 vols., 1840); followed by *The Barnabys in America, or Adventures of the Widow Married.* Mrs. T. was a woman of strong talent, and her works are full of shrewd observation, and true, if at times somewhat coarse, humor. They were popular in their day, and very well deserved their popularity; but already they are well nigh forgotten. No list of them in detail seems needed. During the life of her husband, Mrs. T. resided chiefly at Harrow. During her later years, much of her time was passed in Italy, where her eldest son, Thomas Adolphus, had taken up his abode. She died at Florence, 6th October 1863.

TROLLOPE, ANTHONY, second son of Mrs. Frances Trollope, and one of the most popular novelists of the day, was born 24th April 1815. He was educated at Winchester, and subsequently Harrow. While filling a responsible official situation in the Post-office, he found, or made, leisure to amuse the public with a long series of novels, of very remarkable merit. The first work which decisively drew attention, *The Warden*, was followed by a continuation, *Barchester Towers*, which remains, perhaps, the cleverest of all his books. In rapid succession to these, came *Doctor Thorne*, *The Bertrams*, *The Three Clerks*, *Castle Richmond*, *Framley Parsonage* (originally published in the *Cornhill Magazine*), *The Kellys and the O'Kellys*, *Orley Farm*, *The Small House at Allington* (contributed to the *Cornhill Magazine*), *Rachael Ray*, *Miss Mackenzie*, *Can You Forgive Her?* *Ralph the Heir*, *The Golden Lion of Granpere*, *Ayala's Angel* (1881). Besides these, Mr. T. has published volumes on *The West Indies and the Spanish Main*, on *North America*, on *Australia*, and on *South Africa* (1878), a Life of *Cicero* (1881), and sketches of *Thackeray* (1879) and *Palmerston* (1882). T., who died 6th December 1882, is one of the most popular of modern novelists. He sketches the superficial aspects of society with a charming lightness and facility of touch, and is unfailingly agreeable and amusing.

His elder brother, THOMAS ADOLPHUS, has lived for many years at Florence, and is favorably known to the public by his *Girlhood of Catherine de Medici*, *A Decade of Italian Women*, and a number of novels such as *La Beata; Marietta*; *Lindisfarn Chase; Gemma; The Garstangs; The Dream Numbers.* He has also written a *History of Florence*, and in 1877 the *Life of Pius IX.*

TRO'MBONE (Ital. great trumpet), a large deep-toned brass instrument, of the trumpet species, but consisting of two separate parts, so constructed that the two ends of one fit into those of the other, and consequently, by sliding the one part in or out, the tube through which the air passes may be shortened or lengthened, and the pitch changed at pleasure. Three kinds of trombone are in general use, differing in pitch: the *Alto Trombone*, with a compass extending from  to ; the *Tenor Trombone*, with a compass from to  ; and the *Bass Trombone*, whose compass extends from  to . The music for these instruments is written on the alto, tenor, and bass clefs respectively. There is also a *double-bass* trombone, which is but rarely used. The trombone, if judiciously employed, is a very effective instrument in an orchestra—the tone is grander and more powerful than that of the trumpet.

TROMP, MARTIN HARPERTZOON, a celebrated Dutch admiral, was born at the Briel in 1597. When a boy, he went to sea with his father, a commander in the Dutch navy. In an engagement off the coast of Guinea with an English cruiser, his father was killed, and young T. made prisoner. His captors compelled him to serve as a cabin-boy for two years and a half, after which his history becomes for some time obscure. In 1622 we find him a lieutenant on board a Dutch ship-of-the-line; and two years afterwards, Prince Maurice gave him command of a frigate. In 1629 the famous admiral Peter Hein took command of T.'s ship, and was killed by his side. Disgusted by some real or imaginary slight, T. about this time retired from the service. In 1637, he returned, and was created Lieutenant-admiral, by the Stadtholder, Frederick Henry. He was appointed to the command of a squadron of eleven ships. He now prosecuted a vigorous naval war against the Spaniards, taking in one celebrated action, fought on October 21, 1639, 13 richly laden galleons. But the events which were to render the name of T. immortal did not occur until the commencement of hostilities between England and Holland in 1652. On May 19 of that year, he encountered the English fleet under Admiral Blake. The Dutch were defeated with the loss of two ships of war. T. was for a while superseded in command by Ruyter and De Witt, but he was soon afterwards reinstated.

On November 29, same year, he again encountered Blake in the Strait of Dover. This time, success was decidedly with the Dutch. The English fleet was obliged to retire; and T. sailed up the Channel with a broom at his masthead, to denote that he had swept his foes from the seas. They were, however, not long in returning. On the 18th of February 1653, Monk and Deane having been united in command with Blake, they attacked T. near Portland, and defeated him, though only after a contest memorable for its obstinacy. It lasted three days, at the close of which Blake had taken or destroyed 11 ships of war and 30 merchantmen, killed 2000 of the enemy, and captured 1500. On June 2 and 3 following, another terrific battle took place off North Foreland, in which six Dutch vessels were captured, 11 sunk, and the remainder driven into Calais roads. On July 31, the warfare was again renewed off the coast of Holland. On this occasion, the Dutch lost 30 men-of-war, and Admiral T. was killed.

T. was a thorough seaman, homely in manner, benevolent in disposition, and enthusiastic in his calling. He was buried at Delft with great pomp and solemnity.

TRO'MSÖE, a small island on the north-west coast of Norway, in Finmark, lies between the island Kvalö and the mainland. It is four miles long, and about a mile and a half broad. On the eastern side of the island is the small but thriving town of the same name, the seat of a bishop. Russian vessels from Archangel and the White Sea visit this town, and bring corn, which they exchange for dried fish. Pop. about 3000.

TRON or TRONE weight, the most ancient system of weight used in Scotland, is so called from *trone*, a species of heavy beam or balance set up in the market-place, and employed for the weighing of heavy wares. The weights employed in the public markets formed the most convenient reference, and consequently tron weight became the standard. The tron lb. contained 20 oz., but from the custom of giving 'one in' to the score, was always reckoned at 21 oz.; this was the most general value; but it varied in the different market-towns between this and 28 oz. The later tron stone or standard weight contains 16 tron lbs., each lb. 16 tron oz., and each tron oz. 16 drops; the tron lb. is estimated to be equivalent to 1·3747 lbs. avoirdupois.

TROON, an important seaport in the county of Ayr, Scotland, 8 miles south-west of Kilmarnock, and 6 north of Ayr. The greater part of the town (which is not older than the present century) occupies a bare and level promontory; but along the broad and beautiful strand of Ayr Bay, known as the 'South Beach,' stretches, for nearly half a mile, a row of handsome villas and cottages, built chiefly for the accommodation of summer visitors. The place is yearly becoming more attractive as a sea-coast residence, partly on account of its extreme salubrity, and partly on account of the ample scope afforded by its wide stretch of sands for the simple amusements of the sea-shore. The harbor, which occupies the extremity of the promontory, is secure and spacious, and is much frequented. The principal exports are coal and iron, of which Ayrshire yields an abundant supply. Pop. (1881) 2383.

TROOP, in Cavalry, the unit of formation, forming the command of a captain, consisting usually of 60 troopers, and corresponding to a company of infantry. The officers of a British troop are the captain and two lieutenants. Two troops form a squadron. The trooper's pay is 1*s.* 5*d.* a day.

TROO'PIAL (*Molothrus*), a genus of birds of the family *Sturnidæ* (see STARLING), having a short, thick, conical bill; long, pointed wings; and a slightly rounded tail. The Cow T. (*M. pecoris*), also called Cow Blackbird, Cow-pen Bird, &c., is common in North America, passing the winter in the southern parts of the continent, and migrating northwards in spring. Its plumage is of a shining black color except the head and neck, which are black-

Troopial (*Molothrus pecoris*).

ish brown. It is very generally to be seen in attendance on cattle, picking up the insects which they disturb, or which are attracted by their droppings. Like the cuckoo, it makes no nest of its own, but deposits its eggs in the nests of other birds.

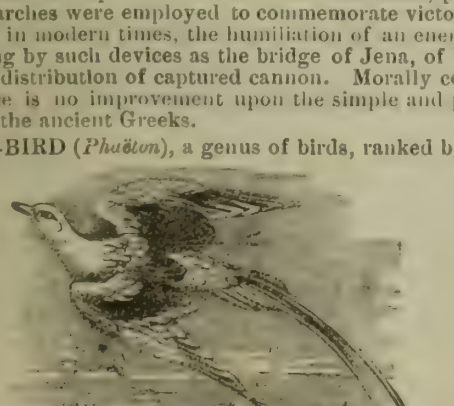
TROPÆ'OLUM, a genus of plants of the natural order *Tropæolaceæ*. This order is allied to *Balsaminaceæ* and *Geraniaceæ*. The species are not numerous, and are all natives of South America. They are smooth herbaceous plants, somewhat succulent, with an acrid or pungent taste, trailing or twining stems, and alternate simple or divided leaves, destitute of stipules. The species of the genus T. form the greatest part of the order, and have usually simple peltate leaves. *T. majus* is the well-known INDIAN CRESS of our gardens, the unripe fruit of which is often used to give pungency to pickles, under the name of *Nasturtium*. It is a native of Peru, and has long been much cultivated in Britain as an ornamental plant, climbing amongst bushes or on trellises, and taking hold by the curving stalks of its leaves; its stems from six to ten feet long, its foliage abundant, and its flowers large, orange, or dark red. The young leaves are used in salads. The Indian cress is really a perennial, although it flowers within a few months from the time of sowing, and in Britain is always treated as an annual, not being able to endure the winter. *T. minus* is very similar, but of weaker growth, and its flowers smaller. *T. peregrinum*, although much more recently introduced into Britain than the Indian cress, has now become almost equally common, and is a great favorite in flower-gardens. It is popularly called the CANARY PLANT. Its stems are long and slender, and it speedily covers a high trellis. Several other species are frequent and fine ornaments of gardens and greenhouses. The tubers of *T. tuberosum* are eaten in Peru. Their taste is peculiar.

TROPE (Gr. *tropos*, a 'change,' a 'turning') is the name of a figure of speech which does not appear to differ from Metaphor (q. v.)

TROPHO'NIUS, in Greek legend, was the most skilful architect of his day, and was the son of Erginus, king of Orchomenus, or of Apollo. Along with his brother Agamedes, he built the temple of Delphi and the treasury of King Hyrieus in Bœotia, which the two are said afterwards to have plundered. After his death, he was worshiped as a hero, and had a celebrated oracle at Lebadeia (Livadia) in Bœotia. 'The entrance to the oracle was a very narrow aperture on the summit of a mountain, protected by a marble parapet about two cubits in height, and by brazen spikes above it.' The votary who wished to enter the 'Cave of Trophonius,' in order to consult the oracle, after preparing himself for several days previously by purification and sacrifice, lay prone on his back, and put his feet into the cave, when he was caught by some unseen force, and violently pulled inside.

TRO'PHY (Lat. *tropæum*, Gr. *tropaion*, from *trepo*, to put to flight—the latter *h* in the English word being an intrusive letter) was a memorial of victory erected on the spot where the enemy had turned to flight. Among the Greeks (with the exception of the Macedonians, who erected no trophies), one or two shields and helmets of the routed enemy, placed upon the trunk of a tree, served as the sign and memorial of victory. After a sea-fight the trophy consisted of the beaks and stern-ornaments of the captured vessels, set up on the nearest coast. It was considered wrong to destroy such a trophy, and equally wrong to repair it, when it had fallen down through time, for animosity ought not to be perpetual. In early times, the Romans never erected trophies on the field, but decorated the buildings at Rome with the spoils of the vanquished. Of this practice, we have a familiar instance in the *rostra* or beaks set up in the forum. In later times, pillars and triumphal arches were employed to commemorate victories. Besides these, in modern times, the humiliation of an enemy is rendered lasting by such devices as the bridge of Jena, of Waterloo, and by the distribution of captured cannon. Morally considered, this practice is no improvement upon the simple and perishable trophies of the ancient Greeks.

TROPIC-BIRD (*Phaëton*), a genus of birds, ranked by some in



Tropic-bird (*Phaëton æthereus*).

the family *Pelecanidæ*, by others in *Laridæ*. The bill is strong, pointed, and almost arched; the head completely feathered; the wings long; the tail short, except two feathers, which are very long and slender. Only two species are known, both tropical, and often seen very far from land. The COMMON TROPIC-BIRD (*P. æthereus*) is about the size of a partridge, white, with curved lines of black on the back; some of the quill-feathers black, tipped with white. It is found in the Atlantic Ocean; whilst in the Indian and Pacific Oceans, the other species (*P. phœnicurus*) appears, which is of a pale rose color, with black wing coverts, and the long feathers of the tail red. The tropic-birds breed on high cliffs.

TRO'PICS (Gr. turning-points or limits) are two parallels of latitude on the terrestrial globe, passing through the most northerly and southerly points on the earth's surface at which the sun is vertical. On the Armillary Sphere (q. v.), consequently, the ecliptic (the representation of the sun's path) touches but does not cross the tropics. The tropics include between them all those points on the earth's surface at which the sun is ever vertical. The tropic north of the equator is called the Tropic of Cancer, because the sun at the summer solstice (at which time he is vertically over that tropic) enters the constellation of Cancer; and the southern one is, for a similar reason, denominated the Tropic of Capricorn. The tropics are not absolutely fixed at a uniform distance from the equator, but the limits of their variation are extremely narrow. For 1st Jan. 1882, the *Nautical Almanac* gives their position in 23° 27′ 16″·60 N. and S. respectively.

TRO'PPAU, the capital of Austrian Silesia, on a tributary of the Oder, is a well-built town, 184 miles north-east of Vienna by railway. It is the seat of the provincial government, and has a castle, cathedral, several palatial buildings, churches, and public schools, a library of 32,000 volumes, a museum of Silesian antiquities, important manufactures of machinery, cottons, linens, and beet-root sugar, and an active transit trade. Pop. (1880) 20,562. A diplomatic congress was held here in October and November 1820, which was subsequently removed to Laibach (q. v.).

TROU'BADOUR (Provençal, *trobar;* Fr. *trouver*, to find, of unknown derivation). In Provençal poetry (see TROUVERE), a troubadour was a polished and cultivated poet—what the Germans call a *Kunstdichter* (art-poet)—who did not make a trade of his muse, in opposition to the musician and jongleur, who wandered about the country singing for money. Yet this distinction only gradually showed itself. At first, all classes of the community were nearly equally rude, and what pleased the peasant in the shape of song, pleased the prince also; but by degrees, a superior refinement and sensibility manifested themselves in the tastes and manners of courts, and this superiority found poetical expression in a more artistic kind of verse than had hitherto prevailed.

Great nobles, princes, and kings who practised verse-making for their pleasure, or out of chivalrous gallantry, were always called troubadours; while inferior knights, court-attendants (M. Lat. *ministeriales;* hence *menestrels*, minstrels), and even citizens and serfs who lived by their art, or at least took money for the exercise of it, were sometimes called troubadours, and sometimes jongleurs. Under this last name were classed the musicians, singers, jugglers (a word, in fact, which is only a corruption of *jongleur*), &c.; all, in short, who did not themselves make or invent (*trobar*) poems, but only recited or chanted them, or whose business it was to accompany the singer on some musical instrument. The more celebrated troubadours had one or several such jongleurs in their service, as it was considered *infra dig.* for a poet to be his own fiddler. This new troubadour poetry (*art de trobar*), which it may be remarked was *lyrical*, while the popular minstrelsy was mainly of the *epic ballad* sort, exercised a considerable influence on the advancement of literature and culture generally; yet those who practised it never formed themselves into a guild, or into special schools, but preserved a certain free individualism, which gives a fine picturesqueness to the outlines of their history.

At all the courts (great and small) in Southern France, Northern Spain and Italy, they were esteemed a brilliant ornament of society; princes and fair dames (often themselves troubadours, as has been remarked) were proud of their praise, and their service of gallantry, or dreaded the biting raillery of their satiric muse; while, on the other hand, the majority of the troubadours gladly attached themselves to the court of a great prince or noble, sometimes praising their master in *sirventes* (service-songs), sometimes censuring him, but at any rate, always selecting some lady as the 'mistress of their heart,' to whom they, under a general or allegorical name, addressed their love-songs (*cansos*), whose cruelty they bewailed in songs of lamentation (*planes*), or whose death they mourned in sorrowful threnodies. Although the 'love-service' of the troubadours was often nothing more than an artificial gallantry, having more *esprit* than heart in it, yet not unfrequently the sport passed into fatal earnest, and adultery, murder, and revenge were the consequences.

Further, when, as often happened at great court-festivals, several troubadours were present, the latter used to indulge in competitions or verse-battles (*tensons*) among themselves, for the gratifica-

tion of the high society assembled there; mostly on questions selected by the ladies from the 'Laws of Love;' one or more of these ladies sitting as umpires at such poetic jousts, and deciding who were the victors. But although the troubadours as a rule monotonously confined themselves to themes of gallantry, yet sometimes their muse, especially in its satiric moods, ventured into higher regions, and glanced at the general conditions of society, or the graver evils of the times—as the wars between the English and French armies in Southern France; the persecution of the Albigenses; the degeneracy of the clergy; the diminishing zeal for the Crusades &c.; or they even descended to depict the life of the peasantry, and sang their adventures with shepherdesses, &c. in *pastoretas* and *vaqueyras*.

The most illustrious patrons of the troubadour poetry were the counts of Provence, particularly Raimund Berengar III. (1167—1181), Alphonse II. (1196—1209), and Raimund Berengar IV. (1209—1245); the counts of Toulouse, as Raimund de St. Gilles, who joined the ranks of the crusaders in 1096, Raimund V. (1148—1194), and Raimund VII. (1222—1249); Richard *Cœur de Lion* of England, himself a troubadour; Eleanor, wife, first of Louis VII. of France, and afterwards of Henry II. of England; Ermengarde, Viscountess of Narbonne; the kings of Aragon, as Alfonso II. (1162—1196), Pedro II. (1196—1213), and Pedro III. (1276—1285); the kings of Castile, as Alfonso IX. (1188—1229), and more especially Alfonso X. (q. v.), surnamed the Wise; several Italian princes, as Bonifacio, Count of Montferrat, and after 1204 king of Thessalonica, and Azzo VII. of Este (1215—1263). These names also indicate the extent of territory on which the troubadour poetry was cultivated—viz., Provence, Toulouse, Poitou, Dauphiné, or briefly France south of the Loire; Catalonia, Valencia, and Aragon in Spain; and part of Upper Italy. It lasted for about 200 years (1090—1290), and one can distinguish three periods in its history: (1) The period of its genesis or birth, or its development out of mere popular minstrelsy into artistic poetry (1090—1140); (2) its golden age (1140—1250); (3) the period of its decline (1250—1290). The first of these periods is marked by a conscious striving after something finer and more poetic than the rude simplicity of the earlier verse; the second, by the loftiest expression of ideal chivalry and gallantry, and the most perfect development of artistic form; the third, by an ever-increasing serio-didactic tendency, and a degeneracy in poetic art. Thus the poetry of the troubadours rose, and ruled, and fell with that courtly chivalry which was at once its inspiration and its soul.

The long list of troubadours begins with GUILLEM IX. Count of Poitiers (1087—1127), the earliest of whom we have any knowledge, and whose verses exhibit partly the popular ballad style, and partly a more elaborate mode of poetic conception. His life and works appear to have been equally immoral.—After him comes BERNARD DE VENTADOUR (1140—1195), one of the first poets of the golden age of troubadour-minstrelsy. He was the son of a poor serf of the Vicomte Ebles II. of Ventadour. Recognizing the talent of young Bernard, his master encouraged and assisted him; but his poetic enthusiasm was more excited by his passion for Ebles's wife, Agnes de Montluçon, than by Ebles's own commendations, and by the favor shown him by later patronesses, Queen Eleanor, Joanna of Este, &c., all of whom he celebrated in fiery and delicate strains.—MARCABRUN (1140—1185), a foundling, was much feared for his power of satire, and was, in fact, murdered by the Castellan of Guian for an exercise of his fatal gift. He is reckoned the inventor of the art-song (*Cansós*).—JAUFRE RUDEL, Prince of Blaya (1140—1170), is equally famous for his languishing love-songs, and his romantic passion for the Countess of Tripoli, whom he never saw till he was at the point of death.—PEIRE D'AUVERGNE (1152—1215), son of a citizen of Clermont, called himself 'Master of the Troubadours;' yet his songs are more remarkable for their artistic finish than for their poetic inspiration.—GUILLEM DE CABESTAING (1181—1196), son of a poor knight, has become famous through his tragic love for the wife of his lord, Raimon de Roussillon.—RICHARD THE LION-HEART'S song composed during his captivity in Austria, is widely known; and the songs of GUIRANT DE BORNEIL (1175—1220) have a manly and earnest ring about them; but perhaps the most celebrated of the whole fraternity was PEIRE VIDAL (1175—1215), a man wondrously endowed with poetic gifts, but who led so mad, wasteful, immoral a life, and committed such extravagant follies, that one doubts whether he was altogether sane. He was the terror of husbands.—BERTRAND DE BORN (1180—1195), equally celebrated as warrior and poet, played an important part in the wars of Henry II. of England with his rebellious sons, and was a zealous French patriot. His songs are for the most part of a political cast, full of martial ardor and the love of fatherland. In his lifetime, men dreaded his sharp tongue no less than his keen sword.—FOLQUET DE MARSEILLE (1180—1231) was the son of a Genoese merchant established at Marseille. After wasting his youth in amorous gaieties, in a fit of grief for the death of one of his many mistresses, he entered the church, rose to the dignity of Bishop of Toulouse, and signalized himself by the fanatical zeal with which he persecuted the Albigenses. Folquet's songs, 25 in number, are of an impassioned nature.—RAMBAUT DE VAQUEIRAS (1180—1207), a native of the county of Orange, in the south of France, was the son of a knight, and so great a favorite with Bonifacio II., Marquis of Montferrat, that the latter positively tolerated his sister's intimacy with the poet. He accompanied his patron to the East, and probably fell with him fighting against the Bulgarians. Some of his songs have found their way into different Romanic tongues.—PEIROT (1180—1225), in his condition and fortunes, curiously resembled his contemporary just mentioned. His pieces rank among the finest love-songs of the troubadours.—The MONK OF MONTAUDON (1180—1200) is a poet whose proper name is not known. He was sprung from a noble family belonging to Auverge, and became Prior of Montaudon, but, notwithstanding, led the free life of a wandering poet. Finally, he betook himself to the court of Aragon; Alfonso II. made him Prior of Villafranca, where he died. He was more renowned for his satire than for his sentiment, and his songs are full of personalities directed against his brother troubadours—very cynical and very caustic.—ARNAULT DANIEL (1180—1200), a nobleman of Riberac, in Périgord, whom love made a troubadour. His powers of invention have been highly praised. Petrarch calls him *il grande maestro d'Amore*. Dante also celebrates his genius.—GAUCELM FAIDIT (1190—1240), son of a burgher of Uzerche, in Limousin, led at first, with his wife Guillelma Monja, the free and pleasant life of a jongleur; but subsequently left her, and became enamoured of the Countess Marie of Ventadour, who made him her troubadour. He would fain have been her paramour also, but she was too prudent; and so, to revenge himself, he carried on intrigues with other women; but his sweetest songs were those he sang in his lady's praise.—RAIMON DE MIRAVOL (1190—1220), one of the most lovable of the troubadours, although the women—his spouse not excepted, who was herself a poetess—abused him so bitterly, that for two years he was out of his mind.—SAVARIE DE MAULEON (1200—1230), a French baron, became Grand Seneschal of Aquitania, and took part with Raimund of Toulouse against Simon de Montfort. His political career was marked by great vacillation. As a poet, he is noted for his *Tenzone*.—PEIRE CARDINAL (1210—1230), son of a night, was intended for the church, but preferred the life of a troubadour, and traveled with his jongleur from court to court. Jago I. of Aragon was his great patron. He was a master of the moralistic *Sirventes*, and assailed—but only with a sort of generalized satire—the nobles and clergy.—The last representative of the troubadours was GUIRAUT RIQUIER (1250—1294), a native of Narbonne. Although he had in his time many patrons, of whom the most distinguished was Alfonso X. of Castile, he was often in sore need; and his poems, full of complaints of the disrepute into which his order had fallen, may be regarded as the swan-song of troubadour poetry.—See Diez, *Leben und Werke der Troubadours* (Zwickau, 1829); Fauriel, *Histoire de la Littérature Provençale* (3 vols., Par. 1846); Galvani, *Osservazioni sulla Poesia de' Trovadori* (Modena, 1829), and *Fiore di Storia letteraria e cavalleresca della Occitania* (Milan, 1845); De Laveleye, *Histoire de la Langue et de la Littérature Provençale* (Brüss. 1845); Mahn, *Die Werke der Troubadours* (Berl. 1846); and *Die Biographien der Troubadours* (Berl. 1853); Brinckmeier, *Blumenlese aus den Werken der Troubadours* (Halle, 1849), and *Rügelieder der Troubadours* (Halle, 1846), Kannegiesser, *Gedichte der Troubadours* (Tüb. 1852), and *Ungedruckte Provenzal. Lieder* (1853); Bartsch, *Grundries zur Geschichte der Provenzalischen Literatur* (1872); Bayle, *La Poesie Provençale au Moyen Age* (1876).

TROUS-DE-LOUP, or WOLF-HOLES, are hidden holes about 6 feet deep, and 4½ in diameter at the top. They are funnel-shaped, and have one or more pointed stakes at the bottom. They are placed often thickly about the glacis and approaches to a fortress; the object being to break the ranks and otherwise disorganize an attacking force.

TROUT (Fr. *truite*, from M. Lat. *tructa*, which, according to Diez, may be from Gr. *troktes*, the name of a voracious sea-fish, derived from *trogo*, to eat), the popular name of many species of the genus *Salmo*, as characterized by Cuvier, some of which are referred by Valenciennes to his restricted genus *Salmo*, some to *Fario*, and some to *Salar*. See SALMON. The name is given to some of the silvery species migrating to the sea, and to all the yellow species, which constantly inhabit fresh waters. The former are noticed in the article SALMON, the present article is devoted to the latter.

Trouts are found in almost all the lakes and rivers of the temperate and colder parts of the northern hemisphere. The COMMON T. (*Salmo fario* or *Salar Ausonii*) is widely diffused in the eastern hemisphere, abounding in almost all the lakes and rivers of the British Islands and the north of Europe. It is found even in very small streams, and almost to their mountain sources, but attains its largest size where there is considerable depth of water and abundance of food. An instance is on record of a T.,

caught in England, in a branch of the Avon at Salisbury, weighing 25 lbs.; but such a size is very rare, and even in ponds where the T. are regularly fed, they seldom exceed 10 lb. A trout of 1 lb or 1½ lb. is reckoned by the angler a very fine fish; and many a stream swarming with T. produces none nearly so large. The head of the Common T. is large; the eye large; the general form symmetrical, stouter than that of the salmon, the convexity of

Common River Trout (*Salmo fario*).

the outline of the back nearly similar to that of the belly; the tail is slightly forked, except in old fish, in which it becomes almost square, and sometimes even slightly convex.

The teeth are numerous, strong, and curved; two rows of them extending along the whole length of the *vomer*, with no marked group at its front. The color is more or less yellow, but the tint varies much in the T. of different waters, sometimes passing into greenish black or violet. The color is brightest in the T. of clear streams. On the back and upper part of the sides there are numerous spots of black and red; the belly is silvery white. The spots on the sides vary much. The fins are light brown; the dorsal fin and tail with numerous darker brown spots. The varieties which the common T. exhibits in tints and spots, has led to the supposition that several distinct species have perhaps been confounded as one, and attempts have been made to point out their characters; but these have not proved satisfactory to the greater number of naturalists. It is certain that the appearance of the T. is much affected by the character of the water in which it lives, and the food with which it is supplied. The T. of a river with a muddy bottom are very different from those of a clear stream, and those of a stream darkly colored by moss are easily distinguished. The tint of the flesh varies as well as the external colors, being pink in some—the finest for the table—and white in others. It has been found that T. transferred from one locality to another soon change their tints.

The T. is very voracious, and readily devours almost any kind of animal food. Worms and slugs washed into rivers by rains are very acceptable to it. Small crustaceans are supposed to be the chief food of T. in some lakes and streams which are noted for the excellence of their produce. Small fresh-water shell-fish are also a favorite food of trout. Small fish of any kind which they can capture are their prey, and multitudes of salmon-fry thus perish. A gentleman well known to the writer of this article caught a large trout which had a very young viper in its mouth, bitten into three pieces; not yet swallowed, probably, because there was not room for it in the over-gorged stomach. The leaping of T. for flies in a summer day or evening adds to the charm of many a rural scene. Small T. often throw themselves quite out of the water; the larger ones in general merely rise to take struggling flies from its surface. The angler adapts his lures to the season and the weather. In spring and summer, when the weather is fine, the artificial fly is very successful; bait, generally the worm, is used in wet weather, or when the streams are much swollen by rains. The minnow is a good bait for large trout. No bait is more deadly than salmon roe, but the use of it is prohibited by law in Britain, for the sake of the salmon-fisheries.

The T. generally spawns in the end of October, when the lower jaw of the male becomes elongated, but not so much as in the salmon. The spawn is deposited in the same manner as that of the salmon, in gravelly beds, in running streams; and the T. of lakes ascend streams for this purpose. Where T. have no access to proper spawning-ground, recourse must be had to artificial means to increase the stock (see PISCICULTURE); but in many small streams their numbers seem incapable of being diminished by any amount of angling. The best feeding-grounds are often where there is no good spawning-ground within reach of the fish. The T. grows rapidly when it has abundant food. From instances of individuals kept in wells and ponds, it is known to attain an age of 30 or even 50 years.

Among the varieties of the Common T., one called the GILLAROO T. is found in Lough Neagh and other lakes of the north of Ireland. It attains a large size, is very thick in proportion to its length, and has much smaller teeth than the ordinary trout.

The LOCHLEVEN T. (*Salmo Levenensis* or *S. cæcifer*) is found in Loch Leven in Scotland, where the Common T. is also found and is distinguished from it by the more pointed pectoral fins; the much longer rays of the tail-fin, which is also more pointed at its extremities; and particularly by the number of the cæcal append-

Lochleven Trout (*Salmo Levenensis*)

ages, which are from 60 to 80 in the Lochleven T., whilst they do not exceed 46 in the Common Trout. The flesh of the Lochleven T. is not white or pink, but red. It attains a large size.

The GREAT LAKE T. (*Salmo ferox*) is the only other British species. It is found in some of the larger British and Irish lakes, and in the lakes of Scandinavia, seldom, if ever, ascending rivers,

Great Lake Trout (*Salmo ferox*).

except for a short distance at the spawning season. It attains a size of almost 30 lbs., is a very powerful, active fish, and tries the skill of the angler in no small degree. It differs from the Common T. in the longer muzzle, in the position of the fins, in having the tail square in all stages of growth, and in other characters. Its color is generally deep purplish brown, passing into greenish or grayish yellow on the belly. The spots are large, and not numerous. The Great Lake T. feeds much on small fishes, and is as greedy as a pike. It is taken by night-lines, or by trolling with strong tackle and a small trout or other small fish for bait. Young fish are taken with the artificial fly. The flesh of this species is very inferior in quality to that of the Common Trout.—Very different from it is the LAKE T. of the Lake of Geneva (*Salmo* or *Fario Lemanus*), which is a fish of excellent quality, and nearly allied to the Salmon Trout. See SALMON. It ascends the rivers which fall into the lake, as the Salmon T. ascends rivers from the sea.

North America has numerous species of trout. One of them, the COMMON BROOK T., or SPECKLED T. (*Salmo fontinalis*), is so similar to the Common T. of Britain, that it may almost be regarded as a variety rather than as a distinct species. It abounds in the streams of Canada and the more eastern British provinces, and in the northern and middle parts of the United States.—The NORTH AMERICAN LAKE T. (*Salmo confinis*) inhabits the deepest waters of the great lakes, and sometimes attains a weight of more than 60 lbs. It is dark-colored, mottled with grayish spots. Its flesh is dirty yellow, and of very poor quality. It never takes the fly, but may be caught with the minnow, or a bait of fat pork. It is more sluggish than its congeners, and affords poor sport to the angler. There are several species of Lake T. in North America. The finest in quality, as well as largest in size, is the MACKINAW T. or NAMAYCUSH (*Salmo amethystus* or *namaycush*). It is not found in Lake Erie, nor in Lake Ontario, but in Lake Huron, Lake Superior, and the more northern lakes, even in those of the arctic regions. It inhabits the deepest parts of them, except in autumn, when it resorts to shallow water for spawning.—The SISKIWIT T. (*Salmo* or *Salar siscowet*) of Lake Superior is of large size, stout, thick, and of rich flavor, but so fat as to be almost unfit for food.—The RED-BELLIED T. (*Salmo* or *Fario erythrogaster*) of the lakes of New York and Pennsylvania, sometimes 2½ feet in length, is deep greenish on the back, lighter on the sides, which are spotted with red, the belly orange red.

The north-west of America has its own peculiar species of T., one of which, the OREGON T. (*Salmo Oregonensis*), is found in almost every stream from the snowy peaks of the Rocky Mountains to the sea, and is very similar to the Common T. of Europe.

TROUVÈRE, the name given in Northern France to the same kind of courtly or polished poet who, in Southern France, &c., was called Troubadour (q. v.). Like the latter, he was usually attended by a jongleur, whose business it was to furnish an instrumental accompaniment to the songs which his master composed and sung. Sometimes but rarely, the trouvère himself played on a harp. On the other hand, if minstrels and jongleurs were ambitious enough to aspire to original composition—as was

the case, for example, with Adenez le Rois, Raymbert de Paris, &c.—they were nicknamed 'Bastard Trouvères' (*Troveor bastart*), or 'interloping rhymers' (*Contrerimoieurs*). This disdainful feeling of superiority was none the less likely to be strong that the poetry of the trouvères was high in favor at the northern courts, and that even kings and nobles were proud of the 'accomplishment of verse.'

Among these princely and patrician amateurs were Thibaud of Champagne, king of Navarre, Jean de Brienne, Charles d'Anjou, Henri III. of Brabant, Pierre de Dreux, Count of Brittany, &c. The great patrons of the trouvères were the kings of France and England, the Dukes of Brabant, the Counts of Champagne, Flanders, &c.; while by the Anjou dynasty of the kings of Naples, their art was carried into Southern Italy, and by Henry of Burgundy into Portugal. The number of trouvères, in consequence, grew to be considerable; and one can still reckon the names and works of more than 150, of whom perhaps the most celebrated is the Castellan de Coucy.—See De la Rue, *Essais Historiques sur les Bardes, les Jongleurs et les Trouvères Normands et Anglo-Normands* (3 vols., Caen, 1834); Dinaux, *Trouvères, Jongleurs et Menestrels du Nord de la France et du Midi de la Belgique* (3 vols., Par. 1837—1843); Paris, *Le Romancero Français* (Par. 1833); Wackernagel, *Altfranz. Lieder* (1846); Mätzner, *Altfranz. Lieder* (1853); Bartsch, *Altfranz. Romanzen* (1870); Scheler, *Trouvères Belges* (1876).

TRO'VER, in the Law of England, is an action brought to recover goods from a person to whom they do not belong, but who has in some way obtained possession of them. It was founded on the old fiction, that the rightful owner had accidentally lost the goods, and the party in possession had found them, and would not give them up to such owner. It is practically an action to try the title to the goods, and therefore is of extensive application in the law of contracts, as well as other branches of law. The plaintiff, if successful, recovers the value of the goods as a satisfaction. The defendant is said to have illegally converted or appropriated the goods, and it is by the conversion of the goods that the damage is done, and for which the remedy is given.

TROW'BRIDGE, a market-town of Wiltshire, stands on a rocky eminence in the valley of the river Biss, 10 miles south-east of Bath. In the church of St. James, which dates from the 14th c., Crabbe the poet officiated as clergyman from the year 1814 to 1832, and his remains repose under a monument in the chancel. The town has long been the seat of woollen manufactures, and these, within recent years, have been carried on with much spirit and success. Cassimeres, kerseys, tweeds, and woollen cloths of the best qualities are manufactured. Many handsome villas have been erected outside the town by the wealthy manufacturers. Pop. (1871) 11,508; (1881) 11,041.

TROY. The earliest traditions of the Greek people, as contained in their oldest poetry and history, represent the country on both sides of the Ægean as peopled by various races, either of genuine Hellenic, or of closely affiliated tribes. Among those who peopled the eastern or Asiatic coast are specially named the Pelasgi, the Leleges, the Caucones, the Carians, the Lycians, and the Trojans. These last, to whom Homer's poem has given a celebrity that throws all the rest into the shade, occupied the small country in the northwest corner of Asia Minor, best defined, perhaps, as the region of Mount Ida, with its topographical dependencies. That the Trojans were either a Greek race, or some non-Hellenic people under a Greek dynasty, seems probable, from the absence in Homer of any such decided national contrast between Greeks and Trojans, as we find in medieval poetry between Christians and Saracens. Local legends represented them as closely connected with Crete; and Homer in the *Iliad*, xx., makes Priam the sixth in descent from Dardanus, the first of the dynasty, who was supposed to have come from Crete.

The story of the Trojan war, which forms the subject of Homer's great poem the *Iliad*, is extremely simple. The Trojans, in the person of Paris, or Alexander, the son of the reigning monarch, Priam, are represented as having had certain dealings with the Achæans, or Greeks of the Peloponnesus, in the course of which the gay young prince carries off from the palace of Menelaus, king of Sparta, his spouse Helen, the greatest beauty of her age. To revenge this insult, the Greeks banded themselves together, and sailed against Troy with a large fleet. All the Greek tribes afterwards famous in history took part in this expedition; but the most notable were the Argives or Achæans—Greeks of the east and north part of the Peloponnesus, and adjacent isles; the Spartans—Greeks of the south-east district of the Peloponnesus; the Neleids—Greeks of the west coast of the Peloponnesus; the Bœotians, and the Thessalians. Of the Thessalians, the most prominent captain was Achilles; and the general command of the whole expedition was committed to Agamemnon, king of Mycenæ, as the head of the most numerous contingent, and at the same time the brother of the royal person whose hospitality had been so grossly violated. This well-appointed European army is represented as having spent nine years in besieging the god-built walls of the city of Priam without making any impression on its strength.

A violent quarrel between Achilles and Agamemnon, breaking out in the tenth year, so weakened the invading force, that the Trojans, under Hector, pushed the Greeks back to the very verge of the sea, and almost set their ships on fire. This quarrel forms the subject of the *Iliad*. At the critical moment, however, the Thessalian captain is reconciled to the head of the expedition; and with his return to the field, the fortune of war changes; Hector, the champion of Troy, falls, and the impending doom of the city is darkly foreshadowed. The siege and sack of Troy did not fall within the plan of Homer's poem, but are narrated at length in the *Post Homerica*, a Greek poem by Quintus Smyrnæus, a poet of the decadence. The Greeks possessed a long series of popular poems called the Cyclic poems, in which the whole sequence of the Trojan story was narrated, giving completeness to the brilliant fragment, which has been adorned by the genius of Homer. From these poems—of which the abstracts are still preserved—Virgil derived those materials which he has used with such effect in the second and third books of his great poem. The Cyclic poems, besides the events in the Trojan war after the death of Achilles, contained an account of the various colonies in Italy and elsewhere believed to have been founded by the scattered chiefs of the expedition after their return home. Of these, the settlements of Diomede, Philoctetes, and Idomeneus, on the south-east coast of Italy, and that of Æneas on the banks of the Tiber, are the most famous.

The chronology of the Trojan war, depending as it does mainly on artificial construction from genealogical data, is not, of course, trustworthy; but there are good reasons for believing that the generally received date of 1184 B.C. is not far wide of the mark. After the fall of the kingdom of Priam, the future story of Troy is short and uneventful. Under the Lydian kings, whose dynasty culminated in Crœsus, a New Troy—*Ilium Novum*—began to creep into notice, which, from the glory that belonged to its name, and the favor of Alexander the Great, Julius Cæsar, and other influential visitors, grew into some significance. The interest which attached to it, however, in its most flourishing estate was more antiquarian than political.

How far the events of the Trojan war, as found in Homer and the Cyclic poets, are to be taken as historical, depends upon the view which is taken of the general character of the materials of popular ballad poetry in all countries. That there is in the general case an under stratum of historical reality, out of which the earliest popular poetry grows, may be assumed as certain. But how strong the tendency is, in early uncritical ages, to erect on this foundation a purely imaginary superstructure, need scarcely be mentioned. At the same time, there is a very great difference to be observed in the popular poetry of different nations, in respect of the greater or less amount of trustworthy historical matter which lies embedded in the imaginative conglomerate. The excess of the imaginative, fanciful, and altogether improbable element, is found in our own Arthurian and Carlovingian romances. In Homer, on the other hand, there is a sobriety of tone, a geographical clearness, and a general air of veri-similitude, which incline the reader to accept the historical reality of the main facts. In the first chapter of Heredotus, we find the Phœnicians practising the very same act of abduction, though in a more violent form, which the poet represents as having kindled the famous ten years' warfare between Greece and Troy; and even in the most general view, the war of Troy between rivil peoples on the opposite sides of the Ægean, may be looked on as the natural overture of those great struggles, by which, on the same theater afterwards, the fate of the world, indicated by the preponderance of the European over the Asiatic element, was more than once decided.

The PLAIN OF TROY is formed by the débris of the great chain of mountains which terminates the peninsula of Asia Minor on the north-west, where it is separated from Europe by the Sea of Marmora and the narrow strait of the Dardanelles. This chain of mountains is called Ida by Homer (*ide*, wood); and its highest peak towards the south side of the Troad, overhanging the Bay of Adramyttium, is celebrated by the same poet as Gargarus. Westward from this chain, the land slopes gradually down by a series of undulating ridges to the south coast of the Dardanelles. The plain included between these ridges and the sea is the plain of Troy. It is surrounded on all sides by elevated ground, by hills and mountains towards the east and south-east, and by rocky ridges or cliffs along the coast. At one place only does it open to the sea, and this is at the extreme north-west corner, where it meets the south end of the Dardanelles. Here there is a stretch of sandy shore about two miles in length, beginning behind the Turkish fort of Koumkale, and trending eastward. This is the only place where a fleet such as that described in the *Iliad* could effect a permanent landing; and here, accordingly, by general consent, the encampment of the Greeks is placed.

The promontory which bounds this bay to the east is universally acknowledged as the Rhæteau promontory of the ancients, while that on the west is the Sigean. Here, also, as the natural mouth of the plain, the principal river, by whose action mainly it was formed, finds its way into the sea. This river is the Mendereh, obviously a corruption of the Homeric Scamander, called also by the poet Xanthus, from *xanthos*, that is, the *yellow* river, from the color of its waters; a quality which has been noticed by most modern travelers. Looking up the plain from any of the heights about the mouth of the river in a south-easterly direction towards Gargarus, its course can be easily traced to a distance of about nine miles, where it emerges into the plain through a defile in the mountains. This distance of nine miles, therefore, is the extreme length of the plain of Troy. Its breadth is about three miles. It presents the appearance of 'a long tract of meadow-land, enclosed within a girdle of low, round-backed hills, and prettily garnished by many lines of trees, which skirt the water-courses.' These waters, with the single exception of the Scamander, are not large enough, according to our usage, to deserve the name of rivers, but are mere mountain-torrents or brooks, generally dry in summer, some of them nothing better than a sort of natural drains or ditches.

Those deserving of mention are three: the first flowing from the chain of Ida westward into the plain, about three miles from the sea, called the *Dombrek;* the other in the same direction, about five miles further up, called the *Kimair*. The third streamlet rises at the head of the plain, near the Turkish village of Bunarbashi, and creeping along the bottom of the slope towards the Archipelago, forms the boundary of the plain on the west, and empties itself into the Mendereh, about two miles above its mouth. One of these streams must be the Homeric Simois.

The topography of a plain so famous in the history of human civilization has, of course, occupied the attention of the learned both in ancient and modern times; and a considerable library could be formed of volumes in which this region has been described, and its most famous localities discussed. The topographical result of these voluminous discussions can, however, now be given in a very few sentences. In the first place, after seventy years of confusion and hallucination, it may be regarded as certainly established, that the Mendereh is the Scamander. It is also universally allowed that *Novum Ilium*, or New Troy, occupied the site of Hissarlik, on an eminence about four miles from the mouth of the river, on its right bank, near the bend of the Dombrek. It is also a matter of general consent, that the great tumulus or barrow, near the Sigean promontory, where the Dardanelles broaden up into the wide Ægean, is the veritable monument of Achilles, described by Homer in a famous passage of the *Odyssey*; but beyond these three points, it cannot be said that any part of the classical topography of the plain has been ascertained with certainty. The great point to determine, of course, is the site of the Homeric Troy, the capital of the empire of Priam; but this is a matter which, in default of inscriptions, can be ascertained only by previously deciding which of the three streamlets above mentioned is the true heir to the legendary glories of the Homeric Simois; for between the Scamander and the Simois the tide of battle rolled to and fro, as Homer expressly tells us; and at the head of the plain between these two rivers the town of Troy must certainly stand.

Those who hold with Strabo among the ancients, and Maclaren among the moderns, that the Dombrek is the Simois, have strong ground for maintaining that New Troy was built upon the site of Old Troy, and that no further search is necessary; while they who look on this point as suspicious, must recognize the Simois in the river of Bunarbashi, and the site of the Pergamus of Priam on the plateau at the great bend of the Scamander, about a mile to the eastward of the village of Bunarbashi, where the substructions of an ancient city have been lately excavated. Those who wish to see this nice topographical question discussed in the most masterly style, will read *The Plain af Troy Described*, by Charles Maclaren (Edin. 1863), on the one side; and *Ueber das Homerische Ilion*, by Professor Welcker, in his collected tracts (Bonn, 1845), on the other. A succinct exposition of the arguments on both sides will be found in Professor Blackie's notes to the *Iliad*, Book xxi. The literary history of this topographical question, commencing with the work of Le Chevalier, a Frenchman, translated into English by Professor Dalzel in 1791, is extremely curious; but the most distinguished scholars and topographers being now agreed that the Mendereh and the Scamander are identical, it is not necessary to make any allusion to the wonderful discovery of 'the wells of the Scamander,' by which Le Chevalier imagined he had made himself immortal. Dr. Schliemann, who lately carried on a systematic investigation of the supposed neighborhood of ancient Troy, believes he has found, at Hissarlik, its veritable site. In July 1872, he discovered a very large collection of gold, silver, and copper implements and weapons, undoubtedly of great antiquity. Further researches in 1878, revealed various architectural details, gold and silver ornaments, with cockle and mussel shells. See Schliemann's *Troy and its Remains* (1875), and *Ilios* (1880).

TROY, a city of New York, U. S., on the east bank of the Hudson River, at the head of steamboat navigation and tide-water, 151 miles north of New York City, and 6 miles north of Albany, built upon the alluvial flats of the river and hills, called Mount Ida, on the east side. Winants Kill and Poesten Kill, two small streams, having each a series of falls, furnish water-power to mills and factories, besides that given by a dam across the Hudson. At T. is the principal outlet of the canals connecting the Hudson with Lakes Champlain, Ontario, and Erie; and it has railways diverging in all directions, connecting it with New York, Boston, &c. The Union Dépôt, in the center of the city, is one of the largest in America, 60 trains arriving and departing daily. The iron furnaces and manufactories are the largest east of the Alleghanies, being furnished with the magnetic ores of Lake Champlain, and the hematitic ores of Western Massachusetts. The coal is brought from Pennsylvania and Maryland. The chief iron-works are those for bar-iron, railway-spikes, nails, locomotives, stoves, hot-air furnaces, hollow ware, machinery, agricultural implements, &c. Other important manufactures are those of railway cars, coaches, omnibuses, cotton and woollen goods, breweries, distilleries, flour, boots and shoes, shirts and collars—the latter employing 6000 persons, with extensive machinery. There is also the largest manufactory of mathematical instruments in the country. The property which reaches tide-water by the canals centering at T., including lumber, is valued at 17,000,000 dollars annually. A fine iron bridge connects T. with the suburb of West T. The city contains 50 churches, public schools with an annual enrolment of 8000 pupils; the Rensselaer Polytechnic Institution, with 14 teachers and 170 students; a Roman Catholic seminary; asylums, academies, &c. T. was settled by the Dutch in 1752. Three times it has been nearly destroyed by fire; in 1862, the loss was 3,000,000 dollars. Pop. (1840) 19,334; (1850) 28,785; (1870) 46,465; (1880) 56,747.

TROYES, a town of France, formerly capital of the province of Champagne, and now of the dep. of Aube, on the left bank of the river Seine, 103 miles east-south-east of Paris by railway. It is a very old-fashioned place, and most of the houses are of wood. The principal buildings are the cathedral, dedicated to St. Peter, a splendid specimen of *flamboyant* Gothic, founded in 872, and rebuilt between the 13th and 16th centuries; the churches of St. Urban, the Madeleine, St. Pantaleon, and St. Remi, the Hôtel de Ville, a public library, containing 100,000 vols. and 5000 MSS.; a Museum, the Palace of Justice, the Exchange, Merchants' Hall, and various educational institutions. T. is not so populous or important as it was in the middle ages. Even as late as Henry IV.'s time, it had more than 60,000 inhabitants; in 1881, the pop. was 45,824. It carries on numerous cotton and woollen manufactures, and, as the center of a rich agricultural region, it has a large transit-trade.

T., anciently the capital of the Celtic Tricassii, was called by the Romans *Augustobona;* later, *Civitas Tricassium;* and then *Trecæ* (a corruption of Tricassii), whence the modern Troyes.

TROY-WEIGHT. The origin of the term 'Troy' is unknown; some consider it to be a corruption of *le roy*, as the troy pound was, till recently, the standard pound (*pondus regis*); some derive it from *Troy novant*, the monkish name for London; while the majority of philologists and lexicographers profess to see the origin of the name in the town of *Troyes*, in France, an important center of commerce during the middle ages, which hence *may*, like the towns of Cologne, Toulouse, and others, have had its own special system of weights; though why the term should have migrated to Britain, and been exclusively employed there for so long, is not at all evident. A Troy pound (of what value is unknown), is first mentioned in Britain in 1414, long before which period the standard pound of 12 oz., as well as another pound (the Tower pound) of 12 oz., was in use. The term 'Troy' was first applied to the standard pound in 1495, but at the same time no change seems to have been made in its value, and it continued, as before, to be exclusively employed by the dealers in the precious metals, gems, and drugs. See POUND. The troy pound contains 12 oz., each ounce 20 penny-weights, and each penny-weight 24 grains; thus the pound contains 5760 grains, and is to the avoird. pound as 144 to 175; while the troy ounce is to the avoird. ounce as 192 to 175. For medicines, other subdivisions of the Troy pound were formerly employed; but now, medicines are weighed by the Avoirdupois standard (q. v.). The old English pound, to which the term Troy was afterwards applied, was doubtless the pound of silver; and the Tower pound of 12 oz. differed from it only by $\frac{1}{4}$ths of an ounce.

TRUCE, a suspension of hostilities between two armies or states for a period specially agreed upon. During a truce, it is dishon-

orable to occupy more advanced ground, or to resort to any act which would confer advantage. A truce requires ordinarily to be confirmed by the commander-in-chief to become binding. It is lawful to break it before the prescribed period, on notice previously agreed on being given to the opposite party. This is called denouncing a truce.

TRUCE OF GOD. See GOD'S TRUCE.

TRUCK-SYSTEM (French *troquer*, Scotch *trock*, to barter or exchange) is applied to the practice of paying workmen in goods instead of current money. There is no question about the bad social influence of such an arrangement in the ordinary staple and steady systems of productive industry, though there are cases where it is beneficial—as where new works bringing together large bodies of men are started in districts where there is little or no traffic. In such cases, an arrangement to supply the workmen from temporary stores established by their employers, or by persons in communication with them, will be better than leaving the families so collected at the mercy of miscellaneous speculators, probably insufficiently supplied with capital. The Truck Act of 1831 (1 and 2 Will. IV. c. 37) imposes penalties on the employer who pays in goods in certain producing trades. The feature which was supposed to be the supreme triumph of the act, however, and was to make it self-working, was, that all wages so paid were to be a blank. The workman so remunerated had still an action for his wages, and in various shapes it was provided that the goods should be no 'set off' against the money value of the labor. The Report of a Select Committee appointed in 1842 to inqure into the extent and operation of the truck-system, found that, notwithstanding the act, it flourished extensively in several productive trades—as in coal and other mines, iron-works, quarries, and various kinds of manufactories; and they reported that its prevalence had a very pernicious effect on the families of the workingmen. In the year 1853, Mr. J. H. Burton was employed by government to investigate the system as it operated in Scotland; and his Report of the results was presented to parliament. He found that, however pernicious it might be, it was a thing beyond legislative control, and that the attempts to suppress it, in many cases only strengthened its hold, by the completeness of the organization for carrying it out. One, and a perfectly simple, form is this. At a large iron-work, say, the stated payment of the men is monthly. From their improvident habits, however, they are ever requiring advances. These are at once paid in cash. There is at the same time a neighboring store; it may be owned by the same proprietors as the iron-work, or it may be let to some other person at a rent estimated, not at the value of the premises in the market, but at that of the trade which is guaranteed to the tenant. At this store, all purchases are made in cash, and all comers may purchase as at any other shop. The books of the two establishments, however, show how much of his advances each workman has expended at this store. A man says he wants a pound in advance of his monthly wages. He gets the money, and no questions are asked. By comparison of books, however, it comes out how much of this is spent in the store. When he asks another advance, it may be refused, for reasons known to both parties, but not told. In some instances, the registers are so complete that when the workman pockets his advance, he knows, though he has never been told, what proportion of it he must spend at the store to keep in the advanced pay-list. It was found not unusual to limit the free expenditure to 5 per cent., or a shilling in the pound. Thus the system has its foundation in the improvidence of the class it affects. Until that disease is cured, and the workman can wait for the periodical pay-day, he must take his advances on the employer's conditions. As a general economy, the truck-system does not pay. If it is supposed to be profitable, it is from the fallacy, that two profits may be made on one capital. The capital which the iron-master devotes to dealing in beef, tea, and beer, must be subtracted from the capital embarked in his iron-work. This is the business to which he professes to devote himself, and for which he believes himself to have peculiar faculties. His truck-shop either diverts his attention from his main business, or he must hand it over to a hireling, who certainly will not work the capital so embarked, as profitably as that portion employed in the iron-work, and superintended by the owner himself. But in great trades where truck is the established rule, the individual employer cannot help himself. The rate of wages is adjusted on the scale of a portion coming back in the shape of the profit on purchases at the shop. The employer must therefore keep a shop, unless he can get his men to be so reasonable as to work for him on less wages than their neighbors nominally get; but he would be a person of miraculous reasoning powers who would persuade working-men to do that.

TRUFFLE (*Tuber*), a genus of fungi of the section *Gasteromycetes;* globose, or nearly so; of a fleshy substance, with a distinct skin, the whole substance pervaded by a network of serpentine veins, which are the *hymenium*, and bear the spore-cases in minute cavities. The species are not numerous; they are very generally diffused in temperate parts of the world; they are subterranean, often found at the depth of a foot or more in the soil. Some of them are amongst the most highly valued of esculent fungi. The COMMON T. (*T. cibarium*) is of a black color, and has a warty surface. It varies in size from that of a large plum to that of a large potato. On account of its agreeable flavor, it is used in the preparation of many dishes. It is common in the central and southern parts of Europe, chiefly in loose soils, in woods and pastures, as in the chestnut woods of France and Italy. In England, it occurs, pretty abundantly, in the downs of Wiltshire, Hampshire, and Kent. Other species, as *T. æstivum*, *T. rufum*, and *T. moschatum*, are found in some parts of France, Italy, and other countries of Europe, and are sought after and used in the same manner as the Common Truffle. It has recently been discovered that the English species are more numerous than was formerly supposed; truffles have also been discovered in localities in the south of England where their existence was formerly unknown. The gathering of truffles is the occupation of many persons in the places where they abound. They are dug up with a kind of hoe or pick. Dogs are trained to seek them, and readily discover by the scent the spot where they grow underground. The stirring of the soil in the gathering of truffles seems to increase its productiveness.

Truffle (*Tuber cibarium*).

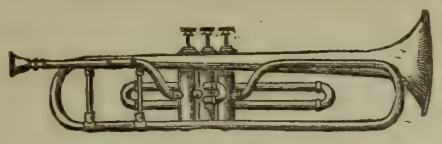
No particular kind of dog is specially employed for truffle-seeking; but one of which the parents are truffle-dogs is preferred, as it is said to be more easily trained. In some parts of France, pigs are also trained to seek truffles. In Germany, the name BLACK T. is given to the Common T., and that of WHITE T. to *Rhizophagon album*, a species of a nearly allied genus, which has also been found in England. It grows half above ground, is of a whitish-red color, and is generally of the size of a large walnut. It is less aromatic than the Common T., but is used in the same way.

TRU'LLAN, the name (derived from the hall—Gr. *troullos*—of the palace in which the Fathers assembled) given to the council also called *Quinisext* (q. v.).

TRUMBULL, JOHN, American painter, son of Governor Jonathan Trumbull (said to have been the original 'Brother Jonathan') of Connecticut, and brother of General Jonathan Trumbull, aide-de-camp to General Washington, was born in Lebanon, Connecticut, 6th June 1756, was educated at Harvard College, and devoted himself to painting. He had completed two pictures, the 'Battle of Cannæ,' and the 'Judgment of Brutus,' at 19, when the war of the Revolution broke out, and he joined the provincial army before Boston as adjutant of the 1st Connecticut Regiment. The execution of drawings of the British works procured his appointment as aid to Washington, and soon after, that of brigade-major. In 1776—1777, he served under Gates and Arnold as adjutant-general; but, offended with the action of Congress respecting the date of his commission, he resigned, and resumed the palette. In 1780, he came to London, *viâ* France, where he was making rapid progress under the instructions of Sir Benjamin West, when, during the excitement occasioned by the execution of Major André, he was thrown into prison.

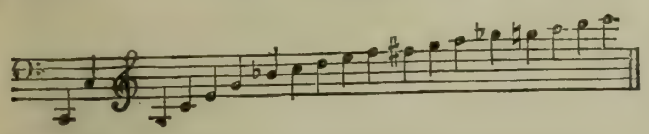
The king, George III., promised West that his life should be spared, but he was kept eight months in prison, and then released on condition of leaving the kingdom. After the war, he returned, and resumed his studies. His 'Priam receiving the Body of Hector,' painted at this period, is in the gallery of the Boston Athenæum. In 1786, he produced the first of a series of modern historical and military works, the 'Battle of Bunker Hill,' followed by the 'Death of Montgomery,' 'Sortie of the Garrison from Gibraltar,' exhibited in London in 1789, and engraved by Sharp. He, this year, returned to America, painted several portraits of Washington, and secured likenesses of many of the prominent actors in the Revolution; and in 1796, returned to England as secretary of legation to Mr. Jay. He was in England again from 1808 to 1815, painting industriously but with little success. Returning then to America, he was employed by Congress to paint four large national pictures for the Rotunda of the Capitol at Washington—the 'Declaration of Independence,' 'Surrender of Burgoyne,' the 'Surrender of Cornwallis,' and the 'Resignation of General Washington, at Annapolis, December 23, 1783.' These pictures are chiefly valuable as collections of portraits. He afterwards completed a gallery of all his historical pictures, 57 in number, on a smaller scale, which became the property of Yale College, and has great historical value. He was the President of the American Academy of Fine Arts from its foundation in 1816, until the formation of the National Academy in 1825; and died in New York, November 10, 1843.

TRUMPET, a musical instrument of great antiquity, which, in its present form, consists of a tube eight feet long, less in diame-



Trumpet.

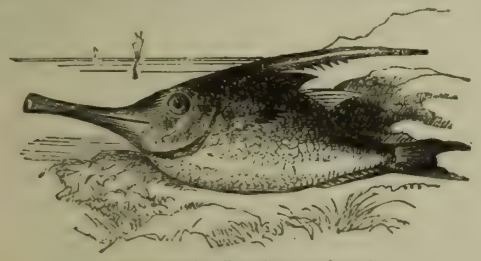
ter than the horn, doubled up in the form of a parabola, and sounded by a mouth-piece. It produces the following progression of sounds:



Music for the trumpet, as for the Horn (q. v.), is written in the key of C, the key to which the instrument is to be adapted being pointed out by the composer. The pitch is an octave higher than that of the horn. Trumpets in the keys of C, D, and E♭ are most used; but there are also trumpets in A, B♭, E, F, and G. To enable the trumpet to give a complete series of semitones, finger-keys and sliding tubes have been introduced by some makers, rather to the detriment of the freshness and fulness of tone of the instrument.

TRU'MPETER, a soldier in a cavalry regiment, whose duty it is to re-pronounce or pass on the orders of the commanding officer; for which purpose certain recognized simple tunes have arbitrary meanings attached to them.

TRUMPET-FISH, or SNIPE-FISH (*Centriscus*), a genus of fishes of the family *Fistularidæ*, remarkable for the elongated and tubular snout. The only British species (*C. scolopax*), rare on the



Trumpet-fish (*Centriscus scolopax*).

British coasts, but abundant in the Mediterranean, attains a length of about five inches, the snout projecting about an inch and a half in front of the eyes. The mouth is destitute of teeth. This little fish is esteemed a delicacy, and is often to be seen in the markets of Italy.

TRUMPET FLOWER, the popular name of certain flowering shrubs of the genera *Bignonia* and *Tecoma*, both of the natural order *Bignoniaceæ* (q. v.) *Bignonia capreolata* is a native of the southern states of America, but often planted in shrubberies and gardens in the middle states. It is a climbing shrub with conjugate leaves and heart-shaped oblong leaflets. The flowers are reddish-yellow, with a long tubular corolla, from the form of which the English name is derived.—*Tecoma radicans* (formerly *Bignonia radicans*) is also a climbing shrub, and a native of the southern states of America, reaching to a more northern latitude than the last. It has much larger flowers, of a scarlet color. The leaves are pinnate, the leaflets ovate and toothed.—*T. grandiflora* is a native of Japan, with pinnate leaves and flowers much larger than *T. radicans*. Both are cultivated with success in the open air in England.

TRU'NNION. See GUN.

TRU'RO, a municipal and parliamentary borough and seaport of Cornwall, of which county it is considered the metropolis, though Bodmin (q. v.) is the county town, 8 miles north-north-east of Falmouth. It stands at the junction of two rivers, the Allen and the Kenwyn, which are here met by an inlet of the sea called the Truro river, the banks of which present some beautiful scenery, and which admits of vessels of 100 tons burden passing upward to the quays of the town. T. is the center of a mining district, and largely exports tin and copper ore. St. Mary's Church, a Perpendicular edifice of the 16th c., is interesting. The bishopric of T. was constituted in 1876; the new cathedral church of the diocese was founded in 1880. Pop. (1881) 10,663.

TRUSS, an instrument employed in the palliative treatment of Hernia (q. v.), with the view of preventing its descent, and, in some cases, of effecting a permanent cure. It consists essentially of a pad or cushion attached to a metallic spring, with straps so arranged that its position may be retained during the varied postures of the body. The necessity of having recourse to a suitable truss the moment that the slightest protrusion shows itself in any of the parts liable to hernia, cannot be too strongly urged as a matter of necessary general knowledge. At whatever period of life a hernia occurs, if properly attended to, and judiciously supported, it usually gives little trouble, and if it occurs in early life, it may often be cured; whereas, if it be neglected, increase of bulk, and subsequently, diseased states of the parts, often terminating in death, will almost certainly occur. A surgeon should always be consulted in the choice of the instrument.

'The practice,' says Mr. Birkett, 'of leaving cases of rupture in the hands of mere tradesmen cannot be too strongly censured. Amongst the poor, we constantly observe the lamentable effects of this proceeding. Many varieties of trusses have been invented. Mr. Kingdon, surgeon to the City of London Truss Society, considers that the 'circular spring truss' is the most suitable form in the majority of cases. There are occasional cases in which the common truss fails to support a rupture comfortably, and in these cases various instruments, for the most part the property of special instrument-makers, are often serviceable; and the surgeon should be acquainted with the peculiarities of the pieces of apparatus known as the Mocmain Lever Truss, Coles's Truss (with a spiral spring acting on the pad), Salmon and Ody's Self-adjusting Truss, Eggs's Truss, &c. The patient must expect to find the truss somewhat uncomfortable for a week or two, but will soon get used to it. The skin of the part upon which it presses should be regularly washed and bathed with Eau de Cologne or spirit, as, without this precaution, boils are apt to form on it.

TRUSS. See CONSOLE. Also the framework, composed of tie-beam, rafters, struts, &c., forming one of the principal supports of a roof.

TRUSSING, in Ship-building, diagonal timbers or iron plates crossing the ribs internally, and consolidating the whole together. Iron is preferred to wood, as being less heavy and less bulky.

TRUST, in the Law of England, is a confidence reposed in some other person touching land or goods for which the *cestui que trust*, or beneficiary, has no remedy except in the Chancery Division of the High Court of Justice. It means a species of divided proprietorship, whereby the trustee acts as a custodier or strong-box; and yet the benefit of the property is not his, but belongs to the *cestui que trust*. The person who creates the trust is sometimes called the *celui que trust*. As a general rule, all property, whether real or personal, may be made the subject of a trust, provided some policy of the law or statute does not prevent it. Trusts are most frequently created by a will; but they may be declared by word of mouth as regards personality; while as to land, some writing is necessary. No particular words are necessary, but the intention of the party making the trust must be clear. Thus, in wills, a testator sometimes uses words which do not amount to an express trust, but speaks of his 'wish and desire,' or his 'confidence,' that the executor or trustee shall do certain things. These words are called in the law precatory trusts, but are enforced in the same way as more direct language, if no uncertainty exists as to the purposes or mode of carrying out the trust. But if a testator merely recommends an executor to 'consider certain persons,' 'to be kind to them,' or 'to do justice to them,' or 'to make ample provision for them,' &c.—such expressions are treated as too vague to be binding, and therefore the executor may disregard them, or use his own discretion. A trustee's is not a compulsory office, but gratuitous, and therefore he need not accept the office unless he pleases. But if he once accept, he is not at liberty afterwards to renounce, unless the trust-deed contain a provision enabling him to do so, or the Court of Chancery for good reasons discharges him. A trustee cannot delegate the office to a third person, but continues personally bound to do his duty. Where there are several trustees appointed, the office is considered joint, so that if one dies, the survivors continue to exercise the office. As a general rule, all must join in doing any act; but if the trust is of a public nature, a majority may bind the minority.

Each trustee is liable only for his own acts or defaults, and this is so even though, for form's sake, he join his co-trustees in signing a receipt, if he can show that he never received the money in point of fact. Nevertheless, when money lies in the hands of one trustee, the others ought not to be satisfied with his mere statement that the money has been invested by him, but should see that it is actually done. Another rule is, that a trustee is not allowed to make a gain of his office; and so jealous is an English court of this rule, that the trustees of a large estate are not even allowed to sport over the estate—at least so as thereby to keep any valuable right of that kind for their own pleasure. Hence, a trustee is personally liable if he trade with the trust funds, or buy shares in a joint-stock bank; for even though the trust-deed authorize this to be done, he will be liable to pay the debts of the trading con-

cern, though far exceeding the amount of the trust funds. So, if a trustee is a solicitor, and does legal business for the estate, he will not be allowed to charge for his professional labors, but at most will be allowed only the costs out of pocket. It is seldom, therefore, that a trustee can get any benefit to himself from the trust estate, except in the rare case where the *cestui que trust* is dead without heirs, in which case the property will become the trustee's. This is, however, only so as to real estate; for if the trust estate consist of chattels, then, on the death of the *cestui que trust* without heirs or executors, the property goes to the crown, and not to the trustee. It is the duty of a trustee to keep the trust funds safe; and if they consist of moneys, then he ought to invest them in government stock, and not let the money lie unproductive. He is not entitled to lend the money on personal security, or in the shares of any private company; but he may invest in mortgages, unless he is forbidden by the deed or will. If there is, therefore, no power to invest in mortgages, the trustee must invest in three per cent. consols, and a few other government securities.

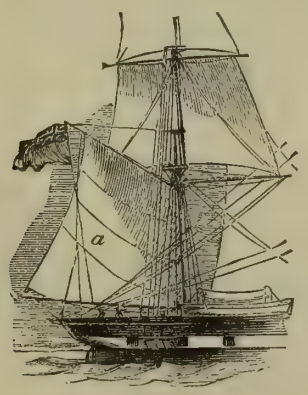
The trustees, as a general rule, must pay interest whether they invest the funds or not (if they have had time to invest) to the *cestui que trust;* and they must account for all the profits they make with the trust funds, whether rightly or wrongfully. If a trustee has grossly misconducted himself as to the trust funds, he will be charged five per cent. interest, and sometimes compound interest. A trustee is entitled to be indemnified for all the reasonable expenses or outlay attending the execution of the trust, but he must in general bear the loss of any mistake as to the law; but if there is any peculiar difficulty in carrying out the trust, he is entitled to take the opinion of, or even to throw the chief management upon, the Court of Chancery, as the only safe protection. When trustees are guilty of gross negligence, mismanagement, or misconduct, the Court of Chancery will remove them, and appoint others.—In Scotland, there are several technical points of difference from the above in the law of trusts.—Paterson's *Comp. of English and Scottish Law*, s. 201. The chief practical difference is, that the investment of the trust funds in heritable securities or mortgages, is considered equivalent or superior to government security, and hence it is the duty of the trustees to prefer such securities, as, owing to the practice of registration of deeds affecting real property, heritable security is always a safe investment there. In Scotland, as in England, trustees holding shares of a joint-stock bank as part of the trust funds, are liable personally to pay the debts of the bank.

TRUXI'LLO, or TRUJILLO, a town of Spain, province of Cáceres, on the great highway from Madrid to Badajoz, and 80 miles north-east of the latter place. There are several churches and convents here. Pop. 9800, who are engaged chiefly in agricultural work. T. is the birthplace of Pizarro, who was also buried here in the church of Santa Maria de la Concepcion.

TRUXILLO, a town of Peru, province of Libertad, near the sea-coast, about 300 miles north-north-west of Callao. The port of T. is Huanchaco, about eight or nine miles to the north-west, from which considerable quantities of rice and spices are exported. Pop. 10,000. T. was founded in 1535 by Pizarro, who named it after his birthplace in Spain.

TRYGON. See STING RAY.

TRYSAIL, a small fore-and-aft sail, mounted by a cutter or



Trysail (*a*).

schooner in a storm, when the wind is too violent for her to carry her ordinary canvas.

TSA'RSKOÉ SE'LO (i. e., Imperial Town), a town of Russia, in the province of St. Petersburg, and 13 miles south of the city of that name. It is the royal residence and favorite resort of the imperial family. The carriage-road from the capital to this town was constructed by the Empress Catharine II. at a cost of 1,000,000 rubles; but the *route* now preferred is that of the railroad—the first laid down in Russia. The façade of the great palace of T. S. is 780 feet long. Originally, every statue, pedestal, and capital of the columns, vases, &c., was covered with gold leaf; only the dome and cupolas of the church are now gilded. The interior of the chapel is lavishly gilded, the ceiling being one sheet of gold. There are several elegant rooms, though most of them are more remarkable for barbaric splendor than for taste. In the palace grounds, which are 18 miles in circumference, is an arsenal, containing a magnificent collection of armor, weapons, and accoutrements of all kinds. The grounds also contain several curious ornamental buildings, statues, artificial ruins, grottoes, lakes, waterfalls, &c. The population in 1880 amounted to 14,603.

TSCHUDI, an ancient and noble family in the Swiss canton of Glarus, several members of which have distinguished themselves as authors, statesmen, and warriors. The two following are the most notable of the Tschudi. GILLES, or AEGIDIUS (born 1505, died 1572), who was active on the Catholic side during the struggles of the Reformation in Switzerland, and in consequence was forced for a time to leave his native canton (1562), but was permitted to return two years afterwards. He was a prolific writer, not less than 166 works of his, in print or in MS., being known. The most valuable is a *History of Switzerland* (Basel, 2 vols. 1734). See Fuch's *Aegid. Tschudi's Leben und Schriften* (2 vols., St. Gall, 1805). To the same family belongs JOHANN JAKOB VON T., the eminent traveler and naturalist, born at Glarus, 25th July 1818. After completing his studies at Leyden and Paris, he undertook (1838) a voyage round the world; but circumstances restricted his design to an investigation into the natural history and ethnography of Peru, where he remained for five years. On his return to Europe (1843), he wished to join the Arctic expedition of Sir John Franklin, but was again prevented by circumstances from doing so, and finally settled in Austria. In 1868 he was made Swiss ambassador at Vienna. T.'s principal works are—*Peru: Reiseskizzen aus den Jahren* 1838—1842 (2 vols., St. Gall, 1846); *Untersuchungen über die Fauna Peruana* (St. Gall, 1844—1847, with 76 plates); the splendid work, *Antiguedades Peruanas* (Vien. 1851), executed in conjunction with Don Mariano Eduardo de Rivera (Eng. trans. 1854); *Die Kechuasprache* (2 vols., Vien. 1853), containing a grammar and dictionary of the Peruvian language, and his *Reisen durch Südamerika* (5 vols. 1868).

TSE'TSÉ (*Glossinia morsitans*), a dipterous insect, which is a terrible pest of some parts of South Africa. It is not much larger than the common house-fly, of a brown color, with four yellow bars across the abdomen. The wings project considerably beyond the abdomen. It is remarkably alert, at least during the heat of the day, and dexterously avoids any attempt to catch it with the hand. 'Its peculiar buzz,' Livingstone says, 'can never be forgotten by the traveler whose means of locomotion are domestic animals.' Its bite is almost certain death to the ox, horse, and dog. Livingstone, in one of his journeys, lost forty-three fine oxen by it. Yet the bite is harmless to man, to the mule, the ass, and apparently to antelopes and the other wild animals of the country. The proboscis is adapted for piercing the skin, and the fly lives by sucking blood. At first, no effect is perceived; but in a few days after an ox has been bitten by the T., the eyes and nose begin to run, 'the coat stares as if the animal were cold,' a swelling appears under the jaw, and sometimes at the navel, emaciation and flaccidity of the muscles ensue, purging, sometimes staggering and madness, and finally death. On dissection, the cellular tissue under the skin is found to be injected with air, as if a quantity of soap-bubbles were scattered over it.—Livingstone's *Travels*.

TSONG-KHA-PA (orthographically, *b*Tsong kha pa*) is the great reformer of Lamaism (q. v.), who, by his co-religionists, was considered to be an incarnation of the Bodhisattwa Amitâbha, or, according to others, of Manjus'ri or Vajrapân'i, and after his death, was canonized by the Lamaist Church. He was born in the middle of the 14th c. after Christ, in the country Amdo, in the place where now the celebrated convent *ss*Ku'bum is situated. According to the legends of Tibet, he was conceived by his mother in a supernatural, immaculate manner: he was born with a white beard, and from the day of his birth expressed himself clearly and fluently, and discoursed profoundly on religious matters. In his third year, he resolved to renounce the world. His mother accordingly cut off his long beautiful hair; but when it fell to the ground, a tree grew up—which is still in a court-yard of the convent of *ss*Ku'bum, and was seen and described by the missionaries Huc and Gabet, in the year 1845. The leaves of this tree are covered with one or more letters of the sacred Tibetan alphabet. He now lived retired from the world, entirely devoting himself to prayer and contemplation. A learned Lama from the West, 'with a long nose and bright eyes,' came to settle about this time in Amdo, and seems to have become his teacher. After

* The small letters prefixed to the initials of the Tibetan words in this article are not pronounced.

his death, T. set out to Tibet, and traveled until he came near Lhassa, where a god bade him halt. Here he studied assiduously the Buddhistic law, and soon became convinced of the necessity of reforming the actual worship and discipline of the Lamaist Church. When his teaching attracted a great number of pupils, and when these, in order to distinguish themselves from the followers of the old system, who wore a red cap, assumed as their mark a yellow cap, the head of the Lamaist Church resolved to stop the innovator in his dangerous course, and accordingly summoned him to his presence. But T. did not deign to obey his command. Thereupon, the great Lama repaired in person to the bold monk; but when he entered the cell of T., his red cap fell off—and when he began to descant on the superiority of the old system, T.—seated and turning the beads of his rosary—without raising his eyes, cried out: 'Miserable! I hear the groans of a creature whom thou murderest!' And, in fact, unmindful of the first commandment of the Buddhist law, the great Lama was busy crushing a louse which he had caught. Confused, he fell at the feet of T.; and from this moment no further resistance could be made to his reforms. Such is the legend; but independently of it, history tells us that the influence which T. exercised on the reform of Lamaism, though not miraculous, was very powerful, such as to reduce the wearers of the red cap to a small minority.

His reputation having widely spread, thousands of pupils thronged round him to hear and to adopt his doctrine. In consequence, in 1407 or 1409, he founded the convent *d*Ga' *l*Dan; and when this could no longer contain the number of his adherents, two other convents, which, together, it is said, are now peopled with 30,000 monks of the yellow cap. His works are numerous and voluminous; the most celebrated of them is the *Lam nim chhen po*, or 'The great Step-road towards Perfection,' consisting of three parts, namely, 'the road of the little, middle, and great man.' The sect which he founded, and which adopted the yellow cap, is called *d*Ge lugss pa, or the sect of virtue; and the principal reforms which he introduced into the Lama religion as it then existed, were compulsory celibacy for the monks—the Lamas of the old doctrine being conditionally permitted to marry—prohibition of scorcery and necromancy—which were extensively practised by the wearers of the red cap—and the institution, at fixed periods, of religious exercises and of common prayers, and, consequently, of regular meetings of the whole community. His greatest achievement, however, was the organization of the Lamaist hierarchy as it still exists. See LAMAISM. He died in 1419. His body is preserved in the convent *d*Ga' *l*Dan: it is free from decay; and, like the tomb of Mohammed at Medina, suspended in the air without any support. His portrait is seen in all the temples of the yellow religion, often between those of the two Lamaist popes, of whom the *Dalai Lama* is at his right, and the *Pan chhen Rin po chhe* at his left. He is recognizable by two lotus flowers which he holds in his hands, folded for prayer, and one of which usually carries in its calix a candle, while the other supports a book. His canonical name is *b*Lo *b*Sang graggs pa, or 'the Celebrated Sage.' —See for further detail, C. F. Koeppen, *Die Lamaische Hierarchie und Kirche* (Berlin, 1859), and the works quoted there.

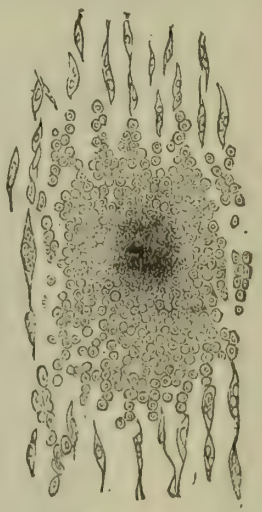
TU'AM, an inland market-town and episcopal seat, as well as center of a poor-law union, of Galway, Ireland, is situated on the Harrow, a branch of the Clare, 125 miles west from Dublin, with which it is connected by a branch from the Midland Great Western Railway. The pop. in 1881 was 3567, of whom more than 3000 were Roman Catholics. At the preceding census of 1871, the population, which is decreasing, was 4423. It has been an archi-episcopal see since the 12th c., and continues to have this rank in the Roman Catholic Church; but in 1839, the province was united, in the Established Church, with the archbishopric of Armagh, of which T. is now a suffragan see. The town possesses little trade, except in agricultural produce; but there are some tanneries, a flour-mill, and a brewery. The Roman Catholic church, which is a modern structure, is of great size, and of very striking architecture. Both the Roman Catholic archbishop and the Protestant bishop have residences in T.; and under the direction of the former is the college of St. Jarlath, numerously attended, but designed chiefly for clerical students. The municipal affairs are under the direction of commissioners. The schools, which are under the care of the brethren of the Franciscan Order, are numerously attended.

TUARIKS. See BERBERS.

TUBER, in Botany, a subterranean stem, thickened by the approximation of the nodes and swelling of the internodes, with latent buds along its sides ready to produce new plants in the succeeding year. The cellular tissue is unusually developed, and in general a large quantity of amylaceous matter is accumulated, whence the economical value of tubers, as in the potato, the Jerusalem artichoke, and the arrow-root. Tubers are capable of being employed for the propagation of the plant, by division into portions, each containing an *eye* or bud, according to the usual mode of planting potatoes. Like bulbs and corms, they may be regarded as a store laid up for the plant itself, that it may spring with new vigor in a new year. Like them, also, and even in a greater degree, they are in many cases a provision for the use of man. The most valuable tubers are those already named, but many others are used in different parts of the world. See OXALIDEÆ, TROPÆOLUM, &c.

TU'BERCLE is a word that has been employed by pathologists of different epochs in very different senses. The older writers employed the term merely to express an external form; and everything was called a tubercle which manifested itself in the form of a small knot. Without entering into any discussion of the views of Laennec (who asserted that tubercle presented itself in the lungs under two different aspects—namely, as *tubercular infiltration* and *tubercular granulation*, and thus opposed the old knot-theory), of Lebert (who was the first accurately to describe the so-called 'turbercle-corpuscles'), of Reinhardt (who, with many others, holds that tubercle is nothing more than one of the forms presented by inflammatory products when undergoing transformation, and that all tubercular matter is really inspissated pus), or of Rokitansky, Van der Kolk, Williams, Walsh, Paget, and other eminent pathologists, we shall briefly give the theory of tubercle which Virchow adopts in his *Cellular Pathology*, and which is perhaps more generally adopted than any other. Virchow holds that tubercle is a granule or a knot, and that this knot constitutes a new formation, which, from the time of its earliest development, is necessarily of a cellular nature, and like all other new formations, has its origin in connective tissue. When this new formation has reached a certain degree of development, it constitutes a minute knot; and if it is near the surface, it forms a little protuberance, its mass consisting of small nucleated cells. The great characteristic of this formation, is its extreme richness in nuclei, of which, at a first glance, it seems entirely to consist. But upon isolating the constituents of the mass, either very small cells with a single nucleus are seen, or larger cells with twelve, twenty-four, or even more divided nuclei are observed, these nuclei being always small, and having a homogenous and somewhat shining appearance.

In the accompanying figure (magnified 300 diameters), the whole succession of transitions is seen from the simple connective-tissue corpuscle, the division of the nuclei and cells, up to the production



Tubercle.

of the tubercle-granule, the cells of which, in the middle, are disintegrating into fatty granular *débris*. In its minute nuclei and very small cells, it contrasts strongly with the large and comparatively gigantic corpuscles of some of the more highly organized forms of cancer. To use the expressive language of Virchow: 'Tubercle is always a pitiful production, from its very outset, miserable.' For an account of the *Cheesy Metamorphosis* which subsequently characterizes the tubercle, and which is the regular but not the invariable termination of this formation (since tubercle *may* undergo a complete fatty metamorphosis, and become capable of absorption, or may undergo calcareous degeneration), see works by Virchow, Rokitansky, Paget. Koch is held by some to have proved that T. is caused by a specific germ (see GERM THEORY), or bacillus, found in all T., and in the spittings of the invalids; and that T. is therefore highly communicable.

Turbercle is usually described as occurring in two principal forms, the first being distinguished as the yellow, and the latter as the gray; the latter is also known from its ordinary size as the miliary turbucle. The latter is the turbucle to which the above description of Virchow applies, the yellow being the same in a state of fatty degeneration or cheesy metamorphosis. In con-

sumption, we often find large masses of softening tubercular matter in the lungs and elsewhere. These large masses are formed by the aggregation of smaller masses, which have coalesced as the deposit continued to increase. The intervening tissues at length suppurate, and thus soften and break down the tubercular matter, and lead to its expulsion; for a process of ulceration having been established into the surrounding tissues, the softened tubercle is brought up by coughing, and a cavity or *vomica* is formed at the spot previously occupied by the morbid deposit. It is a remarkable fact, and one of the greatest importance in the diagnosis of consumption, that tubercles, when they effect the lungs, are almost invariably deposited in the upper lobes. When it is stated that consumption is only one manifestation of Scrofula (q. v.), and that tubercle is the essential element of scrofula, it will be seen that the importance of this subject cannot be overrated. The reader may consult Mr. Ancell's elaborate volume *On Tuberculosis;* or a clever essay, with a similar title, by Dr. Dobell.

TU'BEROSE (*Polianthes*), a genus of plants of the natural order *Liliaceæ*, having a funnel shaped perianth, with 6-parted limb, stamens inserted in the tube of the corolla, a superior capsule, and flat seeds. The COMMON T. (*P. tuberosa*) has rounded bulbous roots; a cylindrical, upright, unbranched stem, three or four feet high; both root-leaves and stem-leaves sword-shaped, and very acute; flowers spiked and somewhat aggregated, large, pure white, the tube a little curved. The plant grows well in the south of Europe, but only bears the open air in more northern climates during summer. The roots are a considerable article of export from the south to the north of Europe; the plant being in high esteem for the beauty and fragrance of its flowers, the odor of which is most powerful after sunset, and has been known to cause headache and asphyxia in a room. The fading flowers emit, in certain states of the atmosphere, an electric light and sparks. The flowers yield an essential oil, which is used by perfumers. The native country of the T. is not quite certain. Another species, *P. gracilis*, is found in Brazil, and has been supposed to be the original of the cultivated plant. The T. has been known in Europe for about three centuries.

TUBE-WELL is an American contrivance, introduced into England in 1867, having for its object the obtaining of a small supply of water in a very short space of time by the application of a limited amount of manual power.

The apparatus comprises three parts—a tube or well, a rammer or monkey, and a pump. Fig. 1 shows the several parts, and fig. 2 the state when driven into the ground. The tube, AA, consists of an iron pipe about 1¼ inch diameter, made in pieces of convenient length, which can be screwed together end to end. The

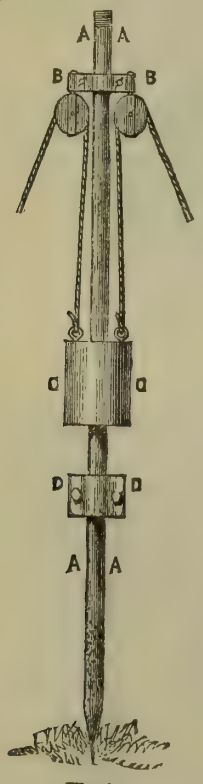


Fig. 1.

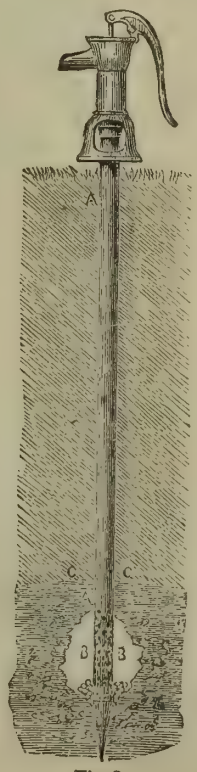

Fig. 2.

pipe terminates at the lower end with a solid tempered steel point, and is perforated for about 16 inches from the end with small lateral apertures. The pipe is driven a short way into the ground, just sufficient to keep it upright without falling, and is temporarily kept in that position by hand. A strong iron clamp, DD, is fixed to the tube by clamping-screws at a short distance above the ground; and another clamp, BB, is similarly fixed higher up. Two pulleys are supported by the upper clamp. The rammer or monkey, CC, consists of a 56-lb. iron weight, which slides up and down the tube, encircling it like a ring or belt. The rammer being raised by two men, is allowed to fall with its full weight on the lower clamp; thus giving a series of blows which drive the tube into the ground. When the lower clamp becomes level with the surface of the ground, it is raised up the tube; as is likewise the other clamp, which supports the two pulleys. Successive lengths of tube and successive shiftings of the clamps afford the means of enabling the perforated end of the tube to reach soil whence water can be obtained. When the symptoms appear of water having been reached, at CC, a small suction pump, shown at the top of fig. 2, is applied, and the water pumped. It is only when water is expected to be reached at a moderate distance below the surface that this apparatus is available, as it is not powerful enough for great depths, nor is the bore of the tube sufficient for a large influx of water; but the required conditions being found to exist, the apparatus saves a large amount of ordinary boring. As the water is pumped up, the loose sand and gravel disappear from the point of the tube, allowing the formation of a small pool or well (BB, fig. 2); while small pebbles which collect around the perforations act as a sort of filter. The tube can be extracted from the ground by forcing the rammer upwards against the upper clamp.

During a trial of this apparatus in the cricket-ground at Old Trafford, Manchester, the tube was sunk to a depth of 10 feet in 22 minutes, and water had been reached in even less than that time. Such a form of well, it is considered, will be free from the liability of receiving dirty surface-water; and no accident is possible from foul air or from the falling in of the sides. A well 15 feet deep was sunk in one hour in the Botanical Gardens at Manchester, and excellent water reached. Another was sunk in the grounds of St. Cloud in half an hour, and pumped up water at the rate of 20 litres (18 quarts) per minute. The inventor accompanied the American Federal army, and enabled the troops frequently to obtain water by the aid of these pumps. On one occasion, to try the capabilities of the tube, he sank one to a depth of 150 feet, at Ithaca, in New York state. Tube-wells were sent out with the British military force to Abyssinia.

TUBI'COLÆ, an order of *Annelida* (q. v.), having a tubular shelly covering, into which the animal can entirely retreat, but from which, when undisturbed, and disposed to activity, it projects its head and gill-tufts. The genus *Serpula* (q. v.) is a good example.

TUBICO'LIDÆ, or GASTROCHÆ'NIDÆ, a family of lamellibranchiate molluscs, remarkable for the calcareous tube into which the proper shell is cemented. Examples are noticed in the articles ASPERGILLUM, CLAVAGELLA, and GASTROCHÆNA. The *Pholadidæ*, including Pholas (q. v.) and Teredo (q. v.), are included by some in this family. *Teredo* has the characteristic tube, but *Pholas* has not.

TÜ'BINGEN, an important town of Würtemberg, in the Circle of the Black Forest, 20 miles south-south-west of Stuttgart, is situated on the Neckar, at the influx of the Steinlach, in one of the most beautiful and fertile districts of the Oberland. T. is an old place, irregularly built, with steep and narrow streets in the main; but the suburbs, especially round about the new university, are very pleasant. Westward from T. is the Schloss, built by Duke Ulrich in 1535. Book-printing, bookselling, working in copper, weaving, bleaching, trading in field-produce, wine, and fruits, form the principal sources of employment.

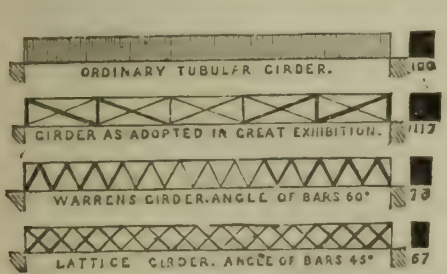
T. has three Protestant churches and one Catholic church, a Bible Society, a Chamber of Manufactures, and various educational and benevolent institutions. But it owes its celebrity wholly to its university. Founded in 1477 by Eberhard im Bart, afterwards first Duke of Würtemberg, the university of T. soon became a distinguished seat of learning, enjoyed for a time the presence of Reuchlin (q. v.), and Melanchthon (q. v.), and continued to flourish long after the Reformation had firmly established itself. The Thirty Years' War, however, fatally checked its prosperity; and it was not till the early part of the present c. that it began to reacquire a reputation. Under Baur (q. v.), it has recently become celebrated as a school of historico-philosophical theology, known as the 'Tübingen School,' the influence of which on the development of religious thought has been very great, and is likely to prove permanent. The university has 6 faculties, above 80 professors and teachers, a library of 200,000 vols. (located in Duke Ulrich's *Schloss*), and is attended annually by from 700 to 850 students, of whom between 200 and 300 are foreigners. Connected with it are an anatomical and physical institute, a botanical garden, a chemical laboratory, a collection of zoology, and comparative anatomy, one of minerals, one of coins

and antiquities, fencing, gymnastic, and swimming schools, &c. Pop. of T. (1880) 11,708.

TU'BULAR BRIDGE. The advantages of the tube for carrying a level roadway across a large span were brought into general notice by Robert Stephenson, engineer of the Chester and Holyhead Railway, in the construction of the bridges to carry that railway across the Menai Strait. It was required by the Admiralty, that these bridges, called the Britannia and Conway, should be constructed, so as not to interfere with the navigation, with clear spans of upwards of 400 feet. The largest arched spans that had been previously constructed did not exceed 240 feet; and suspension-bridges not being suitable for heavy and rapid railway traffic, the engineer was obliged to devise some new form, which should conform to the stipulated conditions.

Mr. Stephenson having decided upon the tubular form, proceeded, in conjunction with Mr. Fairbairn, to make an elaborate series of experiments on tubes, to determine the most suitable arrangement of the wrought iron of which they were to be composed. They found that a rectangular tube, of which the top and bottom were cellular (as in fig. 7, article STRENGTH OF MATERIALS), gave the greatest strength with the least material. The span of the Conway tube was 400 feet; while the tubular part of the Britannia Bridge consisted of two spans of 460 feet, and two of 230 feet each in the clear. The foundation-stones of these bridges were laid in 1846 and 1847 respectively. Since that time, many important bridges have been constructed on this principle. One of the largest and most important is the Victoria Bridge, over the St. Lawrence, near Montreal, in Canada. The total length of this bridge is 9144 feet, or nearly 1¾ mile. It is built in 24 spans, of from 242 to 247 feet each, and one of 330 feet. The greatest depth of the river is 22 feet, and the average rate of the current 7 miles per hour. The bottom of the center tube is 60 feet, and at the abutments the bottom is 36 feet above the water, so that there is a rise of 1 in 130 in the roadway towards the center of the bridge. An idea of the stupendous nature of this structure may be formed from the facts, that 9000 tons of iron were used in the tubes, and 1¼ million of rivets; also that the total surface of iron was 32 acres; and as it received 4 coats of paint, the total painting was 128 acres. There were 2,713,095 cubic feet of masonry, and 2,280,000 cubic feet of timber in the temporary works, dams, &c., and upwards of 3000 men were employed. The first stone was laid on July 20, 1854, and the first train passed over on December 17, 1859. The total cost was £1,400,000, or about £57 per lineal foot.

Notwithstanding the success of these structures, the tubular form has been to a great extent superseded in recent structures by the lattice or trellis. This has arisen from the great saving in the material of which the sides are composed, effected by the open lattice-work, as compared with the solid plated side of the tube. By the lattice arrangement, the material is more capable of arrangement in the direct line of the strains; and the section of the lattice-bars can be accommodated to the strain, so that there shall be no material which is not carrying its due share of the load. The first large structure of this nature was the Boyne Viaduct, on the Dublin and Belfast Junction Railway. Mr. Barton, the designer of this structure, in a notice of this bridge, gives the relative weight in the sides of different forms of girders, neglecting the weights of the top and bottom, which are the same in every case, as follows:



Besides this considerable saving in material, the facilities this form gives for repairs and painting, and the exposure of a smaller surface to the wind, are additional reasons for its preference.

TUBULIBRANCHIA'TA, an order of gasteropodous molluscs, having two branchiæ behind the heart, the whole animal enclosed in a long shelly tube, which is sometimes straight, sometimes twisted in an irregularly spiral manner.

TUCKER, ABRAHAM, an English author whose reputation falls far short of his merits, was born in London, September 2, 1705, studied at Merton College, Oxford, and in 1726 became a member of the Inner Temple. T., who was of good family, inherited a large fortune from his father; and in 1727 purchased Betchworth Castle and estate, near Dorking, in Surrey. During his life he enjoyed all the ease, comfort, and quiet happiness of an English gentleman of the 18th century. It is but fair to state that his frank, generous, virtuous nature, and his sincere love of intellectual pursuits, prevented him from misusing the advantages of his position. In 1736 he married Dorothy, daughter of Edward Barker, Esq.—afterwards Cursitor Baron of the Exchequer, and Receiver of the Tenths—by whom he had three daughters, the youngest of whom, Dorothy Maria, became, in 1763, the wife of Sir Henry Paulet St. John, Bart. T.'s affectionate regard for his family is a beautiful feature of his character. He was, too, all his life, an industrious student, a man of keen observation, of much innocent and cheerful humor, and withal, of methodical business habits. His death occurred November 20, 1774. T.'s great work is entitled *The Light of Nature Pursued*. It was begun in 1756, and formed the chief literary occupation of the rest of his life. It extended to seven volumes, only three of which were published in the author's lifetime, under the pseudonym of Edward Search, Esq. It is not a regular systematic treatise, but consists of a series of disquisitions on metaphysics, theology, morals, &c., all of which exhibit a remarkable originality, simplicity of humor, ingenuity of illustration, and solidity of understanding. Scarcely any English book of the 18th c. is more deserving of study, and scarcely any has been more neglected. A critic in the *Saturday Review* (November 12, 1864) has given an intelligent appreciation of its peculiar merits. The best edition of *The Light of Nature* is that published by the author's grandson, Sir Henry Mildmay, reprinted in 1837. A later edition is that by the Rev. Dr. Cairns.

TUCU'M AND TUCUMA' PALMS. See ASTROCARYUM.

TUCUMA'N, SAN MIGUEL DE, a town of the Argentine Confederation, capital of the province of the same name, about 120 m. N.W. of Santiago, is embosomed in splendid plantations of fruit-trees. T. has a cathedral, convents, a Jesuits' college, and many handsome houses. It carries on manufactures of sugar, leather, and brandy, has an active trade in oxen and mules; and the females are noted throughout the Confederation for their skill in making saddle-cloths. Pop. 17,000. Here, in 1816, a congress of deputies from the various Argentine provinces met, and proclaimed their independence of Spain.

TUDE'LA (the *Tutela* of the Romans), a city of Spain, province of Navarra, on the left bank of the Ebro, which is here crossed by a bridge of 17 arches, 46 miles by railway north-west of Saragossa. It is a dull, gloomy-looking place, with narrow streets and lofty houses; but the promenades along the river are very fine, as also are the *plazas*, or public squares. T. is the seat of a bishop, has a Gothic cathedral, a medical college, and manufactures of coarse woollen cloths, soap, earthenware, &c., and carries on an active trade in the products of the district. Pop. (1877) 10,086.

TUDOR, the surname of a family of Welsh extraction, which occupied the throne of England from 1485 to 1603. In the Welsh language, Tudor is the equivalent of Theodore. Owen Tudor, the first of the race known in history, has had a pedigree assigned him from the ancient Welsh princes, which rests on no very solid evidence. In fact, little is known of his origin, except that his father had to quit Wales on a charge of murder, and was outlawed. He seems himself to have been at one time a brewer at Beaumaris, in Anglesey; and he was afterwards a retainer in the suite of the Bishop of Bangor, and fought at Agincourt. His dancing at some court pageant is said to have first ingratiated him with Catharine of Valois, widow of Henry V., who appointed him to the office of Clerk of the Household, and before long entered either into an illicit connection or a private marriage with him.

The indignation of the public at this step obliged the queen to take refuge in a convent at Bermondsey, where she died; and Tudor was sent to Newgate, but succeeded in escaping, and obtaining two audiences of the young king, Henry VI., who afforded him protection, and conferred on him the lieutenancy of Denbigh. Two sons had been born to him by the queen. On the elder, Edmond, the king bestowed the earldom of Richmond; and on the younger, Jasper, the earldom of Pembroke. The Earl of Richmond married Margaret, daughter and heiress of John Beaufort, Earl of Somerset, whose father was an illegitimate son of John of Gaunt by Katherine Swynford. The sole issue of Richmond and the heiress of Somerset, Henry, Duke of Richmond, invited from abroad to deliver England from Richard III., ascended the throne after Richard's death at Bosworth as Henry VII. The partisans of the House of Lancaster supported him on the extinction of the lawful descendants of John of Gaunt; and by his marriage with Elizabeth, eldest daughter of Edward IV., and representative of the House of York, he was considered to have united the factions of the White and Red Rose. Five sovereigns of the House of T. successively occupied the throne—viz., Henry VII., Henry VIII., Edward VI., Mary, and Elizabeth—for an account of whom see separate articles. From Elizabeth, the last of the line, the crown passed to James VI. of Scotland, of the House of Stuart, in virtue of his descent from Margaret Tudor, daughter of Henry VII., and queen of the Scottish James IV. Strength of will was the prominent characteristic of the sovereigns of the

House of T.; their rule, generally prosperous, was far more arbitrary and despotic than that of the Plantagenets. Parliament was in many cases but the exponent of the royal will, and taxes were frequently exacted, and penal statutes dispensed with, by the prerogative alone. The condition of England under the Tudors differed from despotic monarchies chiefly in the important respect that the sovereign had no standing army. The T. monarchs exercised a remarkable influence on ecclesiastical affairs; it was under their rule that the Reformation took place, and the Anglican Church was developed.

TUDOR STYLE, in Architecture, a rather indefinite term applied to the late Perpendicular, and the transition from that to Elizabethan.

TUESDAY, the third day of the week, is so called from *Tiwesdæg*, the day of Tiw or Tiu, the old Saxon name for the god of war. See TYR. The day bears a corresponding name in the other Germanic dialects.

TUFF, or TUFA, a rock formed from the ash or powder ejected from a volcano, mixed with the lapilli, or small fragments of lava. It may be arranged under the air, and remain quite loose, or be cemented by the percolation of water charged with mineral matter, by pressure or other cause. Sometimes the materials are arranged under water, and then the tuff contains organic remains, like other aqueous rocks.

TUILERIES, PALACE AND GARDENS OF THE, were situated in the middle of Paris, on the right bank of the Seine, with Rue de Rivoli running along their north side, and Quai des Tuileries to the south. Here, in 1342, a certain Pierre des Essarts possessed a pleasure house, called the *Hôtel des Tuileries*, on account of its being built in a locality outside the city where there were several tile-works (*tuileries*). Francis I. bought this property from the Sieur de Villeroy, as a present to his mother, the Duchess of Angoulême. It was afterwards chosen by Catharine de' Medici as the site of a new palace instead of that of Tournelles, and the building was begun in 1566. Originally, the palace consisted of only the square structure in the middle; but was greatly enlarged by Henry IV., Louis XIII. and XIV., Napoleon I.; and received still further improvements at the hands of the emperor, Napoleon III. Louis XIII. was the first sovereign who resided at the Tuileries. Louis XIV. only stayed there for a short time, and then established himself at St. Germain; Louis XV. and XVI. lived at Versailles. In 1793, the National Convention held its sittings in the Tuileries; and Bonaparte chose it for his official residence. It was occupied by Louis Philippe, was the imperial residence of Napoleon III., and was burned by the Commune in 1871. The side wings have been restored.

TULA. See TOULA.

TULA-METAL, a peculiar alloy, made of silver, with small proportions of copper and lead. It is manufactured at the imperial metal-works at Tula, or Toula, in Russia, and is used for making the celebrated Russian snuff-boxes, erroneously said to be made of platinum.

TU'LIP (*Tulipa*), a genus of plants of the natural order *Liliaceæ*, having an inferior bell-shaped perianth, of six distinct segments, without nectaries; a sessile three-lobed stigma, a three-cornered capsule, and flat seeds. The bulb is fleshy, and covered with a brown skin. About thirty species are known, mostly natives of the warmer parts of Asia. The name T. is supposed to be derived from the Persian name *Thouleban*, which also signifies a turban. The most famous of all Florists' Flowers is the GARDEN T. (*T. Gesneriana*), which is from 18 inches to 3 feet high, with a smooth stem, bearing one erect, large flower; the leaves ovate-lanceolate, glaucous, and smooth. The T. is a native of the Levant; it was brought from Constantinople to Augsburg by Conrad Gesner, in 1559, and was rapidly diffused throughout all parts of Europe. The varieties in cultivation are innumerable. The tulip mania of the 17th c. in Holland is noticed in the article FLORISTS' FLOWERS. The T. is still most sedulously cultivated in Holland, especially at Haarlem, from which bulbs are largely exported. It is prized merely for the size and beauty of its flowers; its smell being rather unpleasant. Great attention is paid to the cultivation of tulips, not only in the gardens of the wealthy, but often in those of the humbler inhabitants of small towns and villages, in which beautiful beds of tulips may often be seen. Tulips succeed best in a light, dry, and somewhat sandy soil. Bulbs are planted in the end of October, or beginning of November, and the flowers are produced early in summer. Beds of choice tulips are protected in spring by hoops and mats; and in the flowering season an awning of thin canvas is spread over them, which greatly prolongs the duration of their beauty, as they are soon spoiled by exposure to strong sunshine. Tulips are propagated by offset bulbs, and new varieties are raised from seed.

Another species of T. cultivated in gardens is the SWEET-SCENTED T., or VAN THOL T. (*T. suaveolens*), which has a short, hairy stem, and yellow or red flowers, inferior to those of the common Garden T. in beauty, but prized for their fragrance, and for appearing more early in the season. It is often cultivated in pots in windows. It is a native of the south of Europe. The WILD T. (*T. Sylvestris*), a native of many parts of Europe and Asia, is admitted into the British flora, but is a very doubtful native of Britain. It is common in the woods and vineyards of Germany and the south of Europe. It has a slender stem, narrow lanceolate leaves, and a somewhat drooping, fragrant, yellow flower. It develops offset bulbs at the end of fibres thrown out from the root, at some distance from the parent plant. Its bulbs are eaten in Siberia, although bitterness and acridity characterize the bulbs of this genus.

TULIP TREE (*Liriodendron tulipifera*), a beautiful tree of the natural order *Magnoliaceæ*, a native of the United States of North America, having a stem sometimes 100—140 feet high, and 3 feet thick, with a grayish-brown cracked bark, and many gnarled and easily broken branches. The leaves are roundish, ovate, and

Tulip Tree (*Liriodendron tulipifera*).

3-lobed; the middle lobe obliquely truncated. The flowers are solitary at the extremities of the branchlets; they resemble tulips in size and appearance. The bark has a bitter, aromatic taste, and like that of all the *Magnoliaceæ*, contains a bitter principle, called *Liriodendrin*. It has been used as a substitute for Peruvian Bark in intermittent fevers, and is a good tonic. The T. T. is one of the most beautiful ornaments of pleasure-grounds, wherever it grows and flowers well, which, however, in Britain, it does only in the southern parts. It is now plentiful in many parts of the south of Europe. In some parts of the basin of the Mississippi, it forms considerable tracts of the forest. The heart-wood is yellow, the sap-wood white. The timber is easily wrought, takes a good polish, and is much used for many purposes.

TULLAMO'RE, one of the capitals, and now the assize town of King's County, Ireland, also the seat of a poor-law union, is situated on the Grand Canal, 59 miles west-south-west from Dublin, with which it is connected by a branch from the Great Southern and Western Railway. It stands upon what may be called a fertile island of the great Bog of Allen, and has within the last half-century risen into some importance. The population amounted in 1881 to 5098, mostly Roman Catholics. It is a place of considerable business, commanding, from its central position, the inland traffic of a very large and not unfertile district. A large trade in corn and agricultural produce is carried on with Dublin by the canal. There is a large distillery, as also extensive breweries and several tanneries; and T. is the center of a busy cattle-trade. The schools, both conventual and national, are excellent, and numerously attended. There are a jail and court-house, barracks, Roman Catholic and Protestant churches, &c. A newspaper is published here every week. Within a few miles is situated the extensive Jesuit college of Tullabeg, which receives above 150 pupils.

TULLE, a town of France, dep. of Corrèze, at the embouchure of the Solane into the Corrèze. It is for the most part badly built, but has some fine promenades, excellent quays and bridges, a Gothic cathedral, an episcopal palace, a theological seminary, a communal college, an industrial college, a public library, and a theater. One of the suburbs of T., called Souillac, is a national military manufactory, and the town is otherwise notable for its manufactures of leather, paper, cards, lace (known as *Point de Tulle*), liqueurs, and ironmongery. Some say that T. owed its origin to a Roman fort called *Tutela;* and in the vicinity are certain undoubted Roman remains; others, however, think it dates from the 4th c. A.D. The population in 1876 was 11,038.

TULLE, a kind of thin silk lace of a very open pattern and loose structure, usually in narrow widths, for dressing ladies' caps, &c.

TUMBLER. See LOCK.

TU'MBRIL, in an Army, a covered cart on two wheels, for the carriage of ammunition, tools, &c., belonging to the artillery. The name obtained a melancholy celebrity from being applied to the carts which served to carry the unfortunate victims of the French Revolution to the guillotine.

TU'MORS do not admit of a simple definition, but, in the words of Sir James Paget, who has specially investigated this department of surgical pathology, they all belong to the class of overgrowths or hypertrophies, and their most constant distinctive characters are—(1) that they are deviations both in respect to size and shape from the normal type of the body in which they are found; (2) that they have an apparently inherent power and method of growth; and (3) that their development and growth are independent of those of the rest of the body, continuing with no evident purpose when the rest of the body is only being maintained in its normal type.

Tumors are usually divided into two chief groups, known as innocent or benign, and malignant tumors. The characters of the latter are sufficiently discussed in the article CANCER, and we shall therefore restrict our remarks to innocent tumors. These may be divided into *cystic tumors*, or cysts, and *solid tumors;* while the latter are subdivided into the *discontinuous* and the *continuous;* the discontinuous being those which are completely invested with a layer of tissue, which at once isolates them and connects them with the surrounding parts, while the continuous ones appear as growths, not in, but of the surrounding parts, and appear as *outgrowths*, as, for example, many polypi, and pendulous or sessile tumors. In accordance with these ideas, Sir J. Paget classifies innocent tumors as follows: I. CYSTIC TUMORS: CYSTS; which may be (*A*) *Simple* or *Barren*, or (*B*) *Compound* or *Proliferous*. (*A*) *Simple Cystic Tumors* include the varieties known as (*a*) serous, constituting what are termed hydromata, (*b*) synovial, (*c*) mucous, (*d*) sanguineous, (*e*) oily, (*f*) colloid, (*g*) seminal. (*B*) *Compound* or *Proliferous Tumors*, including (*a*) complex cysts, (*b*) cysts with glandular or other vascular growths, (*c*) cutaneous cysts, (*d*) dentigerous cysts. II. SOLID TUMORS and OUTGROWTHS, including (*a*) fatty or adipose, (*b*) fibro-cellular, areolar, &c., (*c*) fibrous, fibro-muscular, (*d*) cartilaginous, (*e*) myeloid or marrow-like, (*f*) osseous, (*g*) glandular, and (*h*) vascular.

Of these various species we shall only notice a few of the most important. *Cutaneous cysts* may be congenital or acquired. They may be found under the skin of any part, but Sir J. Paget regards them as probably a hundred times more common in the scalp than in any other part. Their rate of growth is uncertain. When they grow rapidly, they are apt to ulcerate, and hence are derived most of the so-balled 'horns' of the scalp and face.

Cutaneous cysts are usually formed either by the morbid growth of natural ducts or follicles, or by the enormous growth of elementary structures, which increase from the form of cells and nuclei, and become closed sacs with organized walls capable of producing other growths. A hair follicle or a sebaceous gland of its duct become obstructed, is thus often the origin of a cyst. Cutaneous cysts may be treated in various ways. Those in which the skin over their chief prominence is marked with a small dark point, through which a fine probe may be passed into the cavity, may be gradually emptied by dilating their openings, and pressing out their contents; or they may be extirpated by caustic or the knife.

Fatty tumors are the most frequent of all innocent tumors, and are often described under the name of *lipoma* and *steatoma*. They do not differ materially in structure from the ordinary fat of the adjacent parts, and seldom cause much annoyance, except from their unseemly appearance. No good cause can be assigned for their formation, but they may sometimes be traced to a blow or friction, as of a strap. The age at which they most commonly show themselves is at about forty. They may occasionally be absorbed by the prolonged internal use of liquor potassæ; but this treatment is almost certain to disturb the general health, and as a general rule, excision is the proper treatment. *Fibro-cellular tumors* are remarkable for the rapidity of their growth (three or four pounds in the year, and in one case recorded by Sir J. Paget, a pound a month), and the weight which they may attain (sometimes forty pounds or more). The most common seat of these tumors are the uterus, the scrotum, the bones, the subcutaneous tissue, the lobules of the ear, &c. Polypi of the uterus, nose, &c., belong to this class. Except in the case of polypi, excision is the only available remedy; and in some parts of the body this is of course impossible.

We will conclude with a reference to a remarkable class of cases which often sadly puzzle the inexperienced surgeon. They are known as *Phantom Tumors*, and are apparently due to contraction of the muscles. 'The abdominal muscles of hysterical women are most often thus affected; sometimes with intentional fraud. The imitation of a tumor may be so close as to require great tact for its detection, but chloroform, by relaxing the muscles, dissipates the swelling. Occasionally, these apparent tumors move.' —Paget on 'Tumors,' in Holmes's *System of Surgery*, vol. i., an article containing an excellent abstract of the most recent knowledge on the general subject of tumors.

TUMU'LTUOUS assemblages are, in point of law, in the category of riots, and were carried to an enormous height in the reign of Charles I. It was afterwards enacted by a statute of 13 Ch. II. c. 5, that not more than twenty names should be signed to any petition to the Crown or either House of Parliament for any alteration of matters established by law in church or state, unless the contents be previously approved by three justices or a grand jury; and no petition should be delivered by a company of more than ten persons. A later statute of 57 Geo. III. c. 19, made it unlawful to convene a meeting of more than fifty persons, or for more than fifty to meet in any street within a mile of Westminster Hall for the purpose of considering any petition or complaint to either House of Parliament for alteration of matters in church or state on any day when parliament is sitting. But the act does not apply to meetings to elect members of parliament. Other enactments were passed as to assemblies of persons collected under pretext of public grievances, but these were temporary, and have now expired.

TU'MULUS. See SEPULCHRAL MOUND.

TUN, a word which, under various modifications, exists in the Celtic and Teutonic languages, seems connected with the Latin *teneo*, I hold, or the Greek *teino*, I stretch, and signifies primarily a large vessel or cask. In various countries, Britain included, it denotes also a liquid measure of capacity; in old ale and beer measure, the tun was equal to 216 gallons (each gallon = 282 cubic inches), in old wine measure it was equal to 252 gallons (each gallon = 231 cubic inches). The tun and all other liquid measures of higher denomination than the gallon are no longer legal; but the names are, for convenience, still retained. These denominations had their origin in the natural practice of giving names to casks in common use which preserved a uniform size. As a tun of water weighs a little more than 2000 lbs., it is probable that the ton weight (see TON) was taken from the tun measure.

TU'NBRIDGE, a market-town in the county of Kent, stands on the Medway, on ground rising from the banks of that river, 27 miles south-east of London. The castle, which stands on the Medway, near the entrance of the town, dates from the close of the 13th c., has a noble gate tower of great size, richly ornamented, and is at present occupied as a military training school. The parish church is a large and old, but sadly disfigured building; but the chief establishment of the town is the Grammar-School, of which the revenues are very considerable. Attached to it are 16 exhibitions of £100 a year, tenable at either university, besides 12 lesser exhibitions. The manufacture of toys and turned and inlaid articles of wood (see next article), is a specialty. Pop. (1871) 8209; (1881) 9340.

TUNBRIDGE-WARE, a kind of wood manufacture carried on at Tunbridge and Tunbridge Wells. It consists of such articles as ladies' work-boxes, ring-boxes, desks, &c., which are covered with a veneer characteristic of this industry, and formed from small pieces of wood of square and triangular shape in transverse sections, built up in geometric patterns; these are carefully glued together so as to form a solid mass, from which thin transverse veneers are cut, and are used to cover the articles made. This trade was formerly of much greater importance than at present.

TUNBRIDGE WELLS, a famous English inland watering-place, and after Bath, the oldest in the country, stands on the south border of Kent, 5 miles south of Tunbridge. The town, which is rapidly extending, occupies the head and slopes of one of the valleys of the Weald, and has in general a south-west aspect, commanding very fine views. The three centers of population are Mounts Ephraim, Sion, and Pleasant, separated by a large common and cricket ground. The waters are chalybeate. The Wells, discovered in 1606 by Lord North, are situated at the end of a promenade called the *Pantiles*. In the vicinity are charming rides and walks. The fashionable season is June, July, August and September. Tunbridge-ware is also largely manufactured here. Pop. (1871) 19,410; (1881) 24,309.

TU'NDRA (in Finnish, *Tunter*—that is, mossy flat) is the Russian name for the vast plains which border on the Arctic Ocean in Siberia, and also westwards from the Ural along the north of Europe. They are swampy tracts of land, partly covered over with a thick felt of bog-moss, and partly with a dry snow-white covering of reindeer-moss and different kinds of lichens. It is only the reindeer that renders this frightful waste habitable for the wandering hordes of Samoyedes, who hunt the furred animals as well as the swans and wild geese which in summer flock hither in vast numbers. These polar steppes, however, can be trodden only in winter, when the whole region is one sheet of frozen soil and ice. In summer, when the surface thaws, the greater part of the region becomes an inaccessible morass, except a portion along the north coast of Siberia, which retains its snow covering

throughout the year.—See Schrenk, *Reise nach dem Nordosten des Europ. Russland durch die Tundren der Samoyeden* 1837 (Dorpat, 1848).

TUNE, a short popular melody; also, that property of musical sounds by which they stand to each other in the relation of Pitch (q. v.).

TU'NGSTEN (symb. W, equiv. 92—in new system, 184—sp. gr. 17·6) is a rare metal, which derives its name from the Swedish words *tung*, heavy, and *sten*, a stone. It is chiefly derived from Wolfram (whence the symbol W), which is a tungstate of iron and manganese, and likewise occurs in Scheelite, which is a tungstate of lime. It is unnecessary to describe the means of separating the metal, which may be finally obtained either as a dark-gray powder or in heavy iron-gray bars, which are very hard, and difficult of fusion. Aqua regia and nitric acid convert it into tungstic acid. When 10 parts of this metal are alloyed with 90 of steel, a mass of extraordinary hardness is obtained.

T. forms two compounds with oxygen—viz., a binoxide (WO_2), which is obtained in the form of a brown powder by heating tungstic acid to low redness in a current of hydrogen, and which does not form salts with acids; and an acid teroxide, known as *Tungstic Acid* (WO_3). Independently of *tungstic anhydride*, there are two modifications of this acid, represented by the formulæ HO,WO_3, and HO,W_2O_6, which are known as *tungstic* and *metatungstic acids* respectively. Various tungstates have been formed and examined. Of these, the most singular is tungstate of tungsten ($WO_2.WO_3$), which is of a splendid blue color; and tungstate of soda, which answers admirably as a means of preventing muslin, &c., from bursting out in a flame, when brought in contact with fire. It is unnecessary to notice the metatungstates, or the sulphides, chlorides, &c., of tungsten.

TUNGUS, an ethnographic group of the Turanian family, are at the present time situated to the north and east of the Mongol group, inhabiting the vast plains stretching south from the icy sea of Siberia, between the Yenesei and the Lena, the northern slopes and valleys of the Great Altaï and the hilly uneven tract between the Upper Amur and the Lena. The chief peoples included under this group are the Niuju, the Dāurians, Tshapodshirs, Manchûs (in the south-east), and Lamûts (on the east coast). In the north, they have intermingled with the Samoyedes; in the west, with the Ostiaks, whose territory is on the other side of the Yenesei; and in the south, the Manchûs, though being gradually pushed northward by the Chinese, have for a long time exercised undisputed sway over their supplanters. Divided politically, between Russia and China, the southern portion of them are Buddhists, while the tribes farther north mostly practise Shamanism (q. v.), a few having, by the strenuous exertions of the Russian government, been induced to profess Christianity. The T. are partly nomad and wandering, and partly agriculturists and settled rearers of cattle. The first of these are commonly classed according to the districts they prefer to dwell in, as T. of the forests, or T. of the steppes: the former being shepherds, hunters or fishers; and the latter exclusively shepherds. The steppe T., again, are divided according to the animals of draught they employ, into the reindeer-T., the horse-T., and the dog-T. The T. are in general robust and lively, with flat visage and small eyes, the latter characteristics, however, being much less prominent in them than in the Kalmucks. A portion of the Chinese Tungûs constitute the Ssolon nation so celebrated as warriors in Chinese modern history. The Tshapodshirs tattoo their faces.

TUNICA'TA, a class of acephalous molluscs, having the body enclosed not in a shell, but a soft elastic tunic, which is perforated by two apertures, and is composed of a substance resembling Cellulose (q. v.). The T. are extremely numerous, and are found in all seas. The *Ascidiæ* (q. v.) belong to this class, and the *Salpidæ* (q. v.).

TUNING-FORK, a contrivance for regulating the pitch of the voice or of a musical instrument. It consists of two prongs of steel springing from a handle, and so adjusted as to produce a fixed note when struck. It is usually tuned in C in Britain, and in A in Germany. In consequence of the absence of any universally recognized standard, there is even in this country a considerable variety in the pitch of the tuning-fork. Messrs. Broadwood employ three forks of different pitch to tune their pianofortes: one corresponding to the Philharmonic standard of 30 years back for instruments used for the accompaniments at ordinary concerts; another somewhat higher for pianofortes meant to take part in orchestral compositions; and a fork of still higher pitch, adopted for the present opera and Philharmonic standard, which is about a semitone higher than the standard of 30 years ago. A fork has lately been invented in Germany capable of adjustment to different standards of pitch, by means of a movable brass slider, fitted with a screw, there being indications on the prongs of the positions of the slider which give the pitch adopted by the principal orchestras in Europe.

TU'NIS, a country of Africa, and one of the Barbary States, is bounded on the N. by the Mediterranean, on the W. by Algeria, on the S. by the Desert, and on the E. by Tripoli and the Mediterranean. Its greatest length from north to south is about 440 miles; its average breadth, 160; area, upwards of 45,000 sq. m.; pop., according to latest authorities, 2,000,000. T. is traversed by branches of the great Atlas range, which, in fact, has its proper termination here. The northern coast is rocky and steep, with numerous bays, of which the largest is the Gulf of Tunis; and two of its promontories, Capes Blanco (*Râs-el-Abîd*) and Bon, are the most northern in Africa. The eastern coast, on the other hand, is flat, sandy, and infertile, like that of Tripoli, but has two large gulfs, Hammamet and Cabes (the *Syrtis Minor* of antiquity). The southern part of T. belongs to the desert steppe known as Belud-el-Jerid. There is only one fresh-water lake of any consequence, that of Biserta or Bensart, near the north coast. The brooks and torrents of T. either lose themselves in the sand, or find their way to the sea after a short course. None are navigable. The longest is the Mejerdah (the *Bagradas* of the ancients), which flows in a generally north-eastern direction into the Gulf of Tunis. Other streams are the Ved-el-Milianah and the Ved-el-Kebîr. There are several mineral springs in the country. The climate of T. is fine, and the soil exceedingly fertile, so that, in spite of a very poor knowledge of agriculture, wheat, barley, maize, dhurra, pulse, olives, oranges, figs, grapes, pomegranates, almonds, and dates are abundantly produced. The culture of oil is more attended to, and is very lucrative. Great herds of cattle are fed on the plains; the sheep are famous for their wool; and the horses and dromedaries are no less celebrated. The chief mineral products are sea-salt, saltpetre, lead-ore, and quicksilver. In the vicinity of the sea-coasts considerable manufacturing and trading industry is manifested, more particularly in the cities of Tunis and Susa. Wool, olive-oil, wax, honey, soap, hides, coral, sponges, dates, wheat, and barley are the principal exports. Cloth, leather, silks, muslins, spices, cochineal, and arms are transported by caravans to the interior of Africa, whence are brought for export to Europe, &c., senna, gums, ostrich-feathers, gold, and ivory. Annual value of imports, £1,000,000; of exports, £1,300,000.

The predominant race is of Arabic descent, but there are many Berbers, especially in the interior. The territory of T. corresponds pretty nearly with that of ancient Carthage; and for a sketch of its pre-Christian history the reader is referred to the articles CARTHAGE, ROME, HANNIBAL, HAMILCAR, SCIPIO, JUGURTHA, &c. Its subsequent fortunes, down to 1575, are interwoven with the general fortunes of Barbary (q. v.); but in that year, Sinan Pasha conquered and incorporated it with the Ottoman Empire, and gave it a new constitution. The government was placed in the hands of a Turkish pasha, a divan or council, composed of the officers of the Turkish garrison and the commander of the Janizaries. After a few years, however, an insurrection of the soldiery broke out, and a new government was established, the head of which was a 'Dey,' possessing very limited authority; the chief power being at first exercised by the military divan. Gradually, however, an officer with the title of 'Bey,' whose original functions were confined to the collection of tribute and taxes, acquired a supremacy over the other authorities, and finally obtained a kind of sovereignty, which Murad Bey succeeded in making hereditary. The family of Murad Bey ruled in T. for 100 years, and gained considerable renown both by their conquests on the mainland, and their piratical enterprises against Christian powers at sea. During the 18th c., it became tributary to Algiers. About the beginning of the 19th c., Hamuda Pasha threw off the Algerian yoke, subdued the Turkish militia, and created a native Tunisian army; in consequence of which T. virtually attained independence. The recent rulers, Achmet Bey (1837), Mohammed Bey (1855), and Mohammed Sadyk Bey (1859), have proved liberal, enlightened, and reforming sovereigns. By a firman of October 25, 1871, the sultan renounced the tribute formerly exacted, and fixed the future relations of the Sublime Porte to Tunis. With the proclaimed purpose of chastising the Kroumir tribes, who had made incursions into Algerian territory, France sent an expedition to T. in the spring of 1881; but the outcome of the movement was that under compulsion the Bey signed a treaty giving France extensive power, and practically making T. a French dependency or protectorate. T. is still nominally under the authority of the Bey; but a French minister resident really controls affairs. The Porte protested in vain; but persistent insurrections against French authority necessitated tedious and

extensive military operations. See works on T. by Hesse-Wartegg, Reid, and Broadley (all in 1882).

TUNIS, capital of the state, lies on a small lagoon, near the south-west extremity of the Lake of Tunis, about 3 miles from the ruins of ancient Carthage. The streets are narrow, unpaved, and dirty, but the bazaars are well furnished, and many of the mosques are really splendid. The ceilings of the bey's palace glitter with gold, and carmine, and azure. The courtyard is paved with marble, and surrounded by arcades supported on marble columns. The citadel, begun by Charles V., and finished by Don John of Austria, is interesting from its collection of old arms, and was formerly the great slave-prison of Tunis. There are also Roman Catholic and Greek churches, Jews' synagogues, an Italian theater, and large barracks in Tunis. T. is the commercial center of the state. The imports in 1876 were £345,000, and exports £250,000. In the same year, 1024 vessels entered and cleared the port. T. has silk and woollen manufactures, as shawls, tapestries, mantles, burnuses, caps, turbans, colored cloths, also leather, soap, wax, and olive oil, all of which it exports, together with grain, fruits, cattle, fish, ivory, golddust, coral, &c. Pop. stated at 120,000.

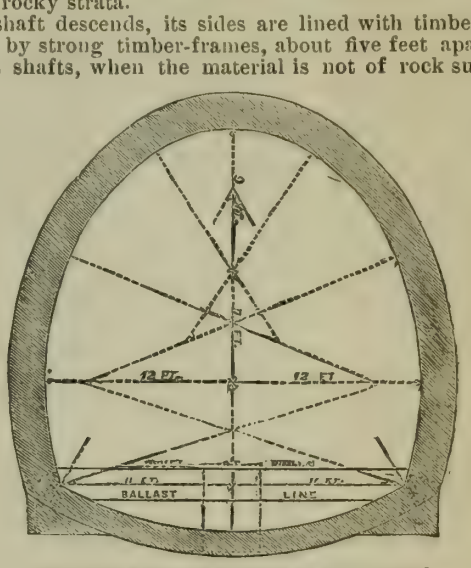
The lagoon or Lake of Tunis is shallow, and communicates with the *Gulf of Tunis*, an inlet of the Mediterranean, by a narrow strait called the Goletta. The gulf itself is 45 miles broad at the entrance—between Cape Bon and Cape Farina—and extends inland for 30 miles. The anchorage is good.

TUNKERS, a religious sect, occupying settlements in New England, New York, Pennsylvania, Ohio, Indiana, &c., and thus pretty widely scattered throughout the northern and middle parts of the United States. They are nowhere numerous, and are chiefly occupied in the cultivation of the soil. The name which they take for themselves is simply that of Brethren, and they profess that their association is founded on the principle of brotherly love. The name T. is of German origin, signifying Dippers, and is due to their dipping in baptism. It is very commonly, by corruption, pronounced and written *Dunkers*. In the vicinity of their settlements, they are generally known as the *Harmless People*. They derive their origin from a small village on the Eder in Germany, but have been an exclusively American sect since the beginning of last century, when they all emigrated to America. They were recently estimated to have over 500 churches, and some 50,000 members. They reject infant baptism, and have no ministers specially devoted to the ministry as a profession. Every brother is allowed to stand up in the congregation and exhort; and when one is found particularly apt to teach, he is ordained by laying on of hands with fasting and prayer, and is expected to devote himself in some measure to the ministry, although without any stipend or pecuniary reward, even if his own crops should suffer by his neglect of them. There are deaconesses as well as deacons among the Tunkers. Like the Quakers, they use great plainness of dress and language; they refuse to take oaths or to fight; and they will not go to law. They celebrate the Lord's Supper, and accompany it with love-feasts, washing of feet, the giving of the right hand of fellowship, and the kiss of charity. They anoint the sick with oil in order to their recovery, depending upon this unction and prayer, and rejecting the use of medicine. They generally believe in the doctrine of universal salvation; but it is not a tenet of the sect. They do not insist upon celibacy as an absolute rule; but they commend it as a virtue, and discourage marriage. They are industrious and honest, and universally held in good repute among their neighbors.

Sole dependence upon prayer for the cure of the sick is the characteristic also of a small religious sect, of which a few members are to be found in England, calling themselves the *Peculiar People*. In Switzerland, the name of Dorothea Trudel (d. 1862) was long famous for the cure of ailments by prayer. She did not, however, in all cases, refuse to call in medical advice. In Germany, a Protestant pastor, Blumhardt, pursues a similar system on a large scale, and it is said with great success.

TUNNEL. Tunnels are passages constructed under ground to carry roads, railways, canals, or streams of water. Tunneling, which has long been in use for roads and aqueducts, has of late received a great development in the construction of railways. At the present time, there are believed to be upwards of 80 miles of railway tunnels in Great Britain in constant use for the passage of trains; and as their cost averages from £45 to £50 per yard, a total of about seven millions sterling has been expended in their construction. The adjoining figure gives the ordinary section of a tunnel to carry a double line of railway. In tunnels of considerable length, as the progress made by working from the two ends would be very slow, it is considered advisable to commence the work from many points of its length; for this purpose, shafts or pits are made at these points down to the level of the tunnel. Of these shafts, some are temporary, and only kept open during the progress of the work; others are permanent, and for the purpose of ventilating the tunnel when in use. These shafts have to be large enough to allow the ascending and descending skips or buckets containing the excavated materials to pass one another. For the temporary shafts, an elliptical shape is found to give the greatest room for this purpose at the least expense. Square shafts are to be avoided, on account of the difficulty of excavating the corners in rocky strata.

As the shaft descends, its sides are lined with timber-planks, supported by strong timber-frames, about five feet apart. The permanent shafts, when the material is not of rock sufficiently



Transverse Section of a Tunnel on the Leeds and Bradford Railway.

solid, are lined with brick-work or masonry, built in lengths, as the shaft proceeds downwards. These permanent shafts are generally made circular in section, and it is found better to place them three or four yards from the side of the tunnel, communicating with it by a small passage. This is convenient in the construction, and also is a useful refuge for workmen subsequently during the passage of trains. These shafts are generally made about ten feet diameter. They are sunk a few feet below the floor of the tunnel, to form a pit for the collection of the water from the workings, which is hauled to the top in barrels or buckets. The raising of the excavations and the water, and the lowering of building materials, and of the workmen, is done by a windlass, a horse-gin, or steam-power, according to the extent of the work. On the completion of the shaft, the tunnel is commenced in both directions from its bottom; and in the case of ordinary rock, it is found convenient to commence by making a small adit, or passage, along from shaft to shaft, through the whole length of the tunnel; this is made six or seven feet high, and the top of it placed at the level of the top of the tunnel. When this is completed, the correct center line is marked out in it throughout the tunnel; the adit is then enlarged to the shape and size of the arch of the tunnel, which is built in, and then the excavation is completed, and side-walls built up to underpin the arch. In cases where the material is soft and full of water, the full section of the tunnel is generally carried forward at once, and in such cases an invert has to be built between the side-walls, to withstand the upward pressure, as the pressure of soft material has the character of a fluid pressure, and presses the tunnel on all sides. The excavation is then done in lengths of about 24 feet, which is firmly secured with poling-boards and larch bars, and securely shored; the centers are then set, and the brick-work built up. The timber bars are generally drawn out when the brick-work is carried up, and the holes they leave rammed tight with clay; but they have sometimes to be built in. When the quantity of water is very great, an adit is driven through the tunnel, at the level of its floor, before the work is begun, to allow the water to run off.

Tunnels are generally made straight, but sometimes they are curved; this is done that they may pass under the lowest part of the hill, in order that the shafts may be as short as possible. They are frequently constructed on steep gradients, but as the trains experience some resistance from the air in passing through them, it is advisable not to made them so steep as the gradients in the open air.

The Mont Cenis* tunnel greatly surpassed any earlier enterprise of the kind. This tunnel connects the railways of France and Italy, and is on the direct railway route from Paris to Turin. The length of this tunnel is 7 miles 4½ furlongs. It is 434 feet higher at Bardonnèche, on the Italian side, than at Modane, on the French side. On this account, it is on a gradient of 1 in 45½

* This is really a misnomer; the tunnel is at a considerable distance from Mont Cenis, and the chief summit under which it passes is the 'Grand Vallon' (11,000 feet high).

from Modane to the middle, and thence it falls 1 in 2000 to Bardonnèche, this latter fall being sufficient to run off the water. The dimensions at Modane are 25 feet 3½ inches wide at base, 26 feet 2¾ inches at widest part, and 24 feet 7 inches high, the arch being nearly semicircular. At Bardonnèche, it is 11¾ inches higher. It is all lined with stone-masonry, except at the Bardonnèche end, where the arch is of brick.

The work was begun in 1857, and was at first done in the usual way by hand; but in 1861, the perforating machines described below were introduced on the Italian side, and two years later (1863) on the French side. On the 30th June 1863, the tunnel had been driven 2800 yards, and the rate of advancement was 9½ feet per day. All the efforts of the engineers to accelerate the work were for several years unavailing; and in October 1866, just one-half the distance, or 6680 yards, had been pierced, showing the same constant rate of 9½ feet per day. At this rate, the tunnel would not have been completed till 1872. Owing, however, to improved modes of working, and to a favorable change in the nature of the rock, the rate of advancement became greater towards the end, and the two parties met on the 25th December 1870. The tunnel was formally opened in September 1871. A premium was to be paid by the French government to the Italian government, who did the work, for each year by which a term of 25 years, counting from 1862, was reduced. The French government were also to pay £1,287,000 for the construction of one-half the tunnel when completed.

This great work, which appeared almost impracticable to ordinary methods of tunneling by manual labor, was rendered practicable by machinery introduced by the engineers, Messrs. Sommeiller, Grandis, and Grattoni. The great difficulty lay in the fact that, from the great height of the mountain, shafts were impracticable, and progress could only be made from each end. The ventilation also presented serious difficulties. M. Sommeiller perfected a small machine, weighing 6 cwt., which bored a hole 1¼ inch diameter and 3 feet deep in twenty minutes; the time taken by two miners working by the ordinary method being two hours. Eleven of these machines were placed on a movable support, and were capable of working at almost any angle. Three or four large holes were bored in the center of the heading, and round these other holes of the ordinary size, in all 80 holes. The large holes were not fired, but were for the purpose of weakening the rock. The others were then fired in succession and in detachments, beginning with those nearest the center, and working outwards. The machines were worked by compressed air acting, like high-pressure steam, on a piston in a cylinder; this air being compressed outside the tunnel by water-power acting on the hydraulic-ram principle, and also by an air-pump; it was used at a pressure of five atmospheres above the atmospheric pressure, and was conveyed to the workings by a pipe 7⅜ inches diameter. After it had expended itself in working the borers, it escaped into the tunnel, and so ventilated the workings. The advanced heading was the only place where these machines were used. During the construction, a temporary locomotive railway was laid along the road over the pass.

The St. Gothard tunnel is a still more stupendous enterprise. It was begun in January 1871, and on 29th February 1880 the borings from the Swiss and Italian sides met, though much time and labor were still required to prepare the tunnel for railway traffic. The total length is 9½ miles, the width 21½ feet. The average rate of progress was 18 feet per day; the improved M'Kean drill, latterly used, cut its way at the rate of twelve inches per minute. The contract of the tunnel was near two millions sterling; but the actual cost, including approaches, is given at several millions more. The Hoosac tunnel in Massachusetts, U.S., is 4¾ miles long, was in progress, with intervals, from 1858 till 1876, and cost above £3,000,000. France proposes a tunnel through the Simplon. A tunnel connecting England and France beneath the English Channel, for which a company was formed in 1872, would eclipse all former undertakings; its length would be thirty-one miles.

TUNNY (*Thynnus vulgaris*), a fish of the family *Scomberidæ* (q. v.), found in the Mediterranean and in the Atlantic Ocean, but particularly abundant in the Mediterranean, where the T. fishery is of great importance. It occasionally, but rarely, occurs on the British coasts. The genus *Thynnus* is closely allied to *Scomber* (see MACKEREL), but has the dorsal fins close together, the detached finlets more numerous. The T. is a very large fish, sometimes nine feet in length, and weighing 1000 lbs., or even more. Its form is much thicker than that of the mackerel; its tail so widely forked as to be crescent-shaped. It is very plentiful near Constantinople, where it appears in shoals, sometimes so crowded that it may even be taken with the hand. The chief T. fisheries of the present day, however, are on the coasts of Spain, Italy, and Sardinia.

The Phœnicians established a T. fishery at a very early period on the coast of Spain, and the T. appears on Phœnician medals of Cadiz and Carteia. Salted T. was much esteemed by the Romans, and was called *Saltamentûm Sardicum*. The T. is generally captured by means of nets arranged in a funnel-like form, the fish entering the wide mouth of the funnel, and being gradually driven

Tunny (*Thynnus vulgaris*).

to the narrow end, where they are killed by lances and harpoons. The line of nets is often more than a quarter of a mile long, and costs about 6000 dollars.—The AMERICAN T. (*Thynnus secundodorsalis*) is found on the coasts of New York, and thence northwards to Nova Scotia. It sometimes attains a length of twelve feet. It is nearly black above, silvery on the sides, and white below. Its flesh is much esteemed. It also yields much oil, which is obtained by boiling the head and the belly. Twenty gallons of oil are often obtained from a single fish.

To the same genus with the T. belong the Bonito (q. v.) and the Albacore or Albicore (*T. albacorus*), which inhabits the West Indian seas, and is esteemed for the table. The name Albacore, however, seems to be often given to different species of this family, inhabiting tropical seas, and sometimes to the T. itself.

TU'NSTALL, a prosperous market-town in the county of Stafford. Pop. (1881) 14,244.

TUPAIA. See BANXRING.

TU'PELO (*Nyssa*), a genus of trees of the natural order *Alangiaceæ*, natives of North America, chiefly of the southern parts of the United States; having simple alternate leaves, mostly entire, greenish inconspicuous flowers at the extremity of long stalks, the fruit a drupe. *N. villosa* attains a height of 60—70 feet. It is often called BLACK GUM TREE. *N. tomentosa*, the LARGE T., is a lofty and beautiful tree, remarkable for the extraordinary enlargement of the base of the trunk, which is sometimes eight or nine feet in diameter, whilst at no great height the diameter diminishes to fifteen or twenty inches. The fruit resembles a small olive, and is preserved in the same way by the French settlers in America. *N. candicans* or *capitata*, the OGECHEE LIME or SOUR GUM TREE, is a small tree, of which the fruit is very acid, and is used like that of the lime. The wood of all the species is soft, that of the Large T. remarkably so.

TUPPER, MARTIN FARQUHAR, D.C.L., F.R.S., a poet rather popular than great, was born on 17th July 1810. His father, Martin Tupper, was a well-known London surgeon, of a family originally German, which had long been settled in Guernsey. Martin T. was educated at the Charter-house, and afterwards at Christchurch, Oxford. On leaving college, he entered himself as a student at Lincoln's Inn, and was called to the bar in 1835; but literature had more charms for him than the law, which he never seriously prosecuted. In 1832, he published anonymously a small volume of poems, which attracted little attention. For this lack of success, he was, however, amply repaid on the appearance, in 1839, of his *Proverbial Philosophy*. The popularity of this work in England, and still more in America, has ever since been immense, and almost unprecedented. The critics have indeed been less kind to it than the reading public; and the fame of Mr. T. has long been a topic of mirth to the wits of the literary guild; but from the serene height of his fortieth edition an author can perhaps afford to smile at the attacks of the envious generation below.

A fair criticism would probably adjudge that, while there is nothing in Mr. T.'s *Proverbial Philosophy* to justify its enormous success—so far as mere circulation is success—the book is yet something better than the mere conglomeration of stupid platitudes, which its detractors so confidently proclaim it to be. Besides this work, on which his reputation—such as it may be—rests, Mr. T. has published *The Crock of Gold*, a tale; *Geraldine*, a sufficiently ludicrous attempt to complete Coleridge's inimitable fragment *Christabel;* with various other works in prose and verse, which it is quite unnecessary to enumerate, inasmuch as no one of them has succeeded in making the least impression on the public.

TURA'NIAN LANGUAGES. In opposition to *Iran*, the name of their own country, the Persians from the earliest times called the countries lying to the north of it Turan, and this name

is still frequently used as synonymous with Turkestan. The term Turanian derived from it has been adopted by philologists, in contrast with Aryan (q. v.), to designate a family of languages comprising 'all languages spoken in Asia and Europe (including Oceania), and not included under the Aryan and Semitic families, with the exception of Chinese and its cognate dialects.' The languages of this family are of the agglutinate order (see PHILOLOGY). Max Müller classes them in two great divisions, the Northern and the Southern. The Northern division falls into five sections—the *Tungusic*, *Mongolic*, *Turkic*, *Finnic*, and *Samoyedic*. Of these, the Tungusic dialects, which extend north and west from China, are the lowest in organization, being, some of them, nearly as destitute of grammatical forms as the Chinese. The Mongolic dialects are superior to the Tungusic, although the different parts of speech are hardly distinguished; both branches, however, are believed to be manifesting symptoms of grammatical development. The Turkic dialects, of which the Osmanli or Turkish of Constantinople is the most prominent, occupy an immense area, extending from the Lena and the Polar Sea to the Adriatic. They are extremely rich in grammatical forms, especially in the conjugation of the verb. The most important members of the Finnic class are the Finnic of the Baltic coasts (see FINNS), and the Hungarian language, or Magyar (see HUNGARY). These dialects have also a fully developed grammatical structure, and in point of declension are even richer than the Turkic.

The Southern division comprises, among others, the *Tamulic* or Dravidian dialects of Southern India (see TAMIL); the *Gangetic* group, divided into two branches, the Trans-Himalayan (Tibetan, q. v.) and Sub-Himalayan (Bhotanese, &c.); the *Taic*, or the dialects of Siam; and the *Malaic*, or Malay and Polynesian dialects. The Turanian languages do not present the same unmistakable family likeness, the same clear evidences of genealogical relationship, as are presented by the Aryan and Semitic groups. The nature of their structure, and the nomadic character of the peoples speaking them, are sufficient to account for their exceeding diversity, even supposing them to have all sprung from the same original stock. 'The only characteristic Turanian feature which always remains is this: the root is never obscured. Besides this, the determining or modifying syllables are generally placed at the end, and the vowels do not become so absolutely fixed for each syllable as in Sanscrit and Hebrew. On the contrary, there is what is called the Law of Harmony, according to which the vowels of each word may be changed and modulated so as to harmonize with the key-note struck by its chief vowel. The vowels in Turkish, for instance, are divided into two classes, *sharp* and *flat*. If a verb contains a sharp vowel in its radical portion, the vowels of the terminations are all sharp; while the same terminations, if following a root with a flat vowel, modulate their own vowels into the flat key. Thus we have *sev-mek*, to love, but *bak-mak*, to regard, *mek* or *mak* being the termination of the infinitive. Thus, we say, *so-ler*, the houses, but *at-lar*, the horses, *ler* or *lar* being the termination of the plural.'—Max Müller's *Science of Language*, 1st series.

TU'RBARY, in the Law of England, is a right to go upon the soil of another and dig turf, and carry away the same. It is classed under the head of a *Profit à Prendre*, and is generally traced to some ancient custom of a manor, or is proved by prescription, or long use for thirty years and upwards.

TU'RBINE. See WATER-POWER.

TURBI'NIDÆ, a family of gasteropodous molluscs, having a spiral shell, with a narrow entire aperture. The species are numerous; some of them are found on the British coasts. They are numerous and widely distributed. Some are large, others small; some are very beautiful. The beautiful pheasant-shells (*Phasianella*) of the South Seas are referred to this family.

TU'RBOT (*Rhombus maximus*), a fish of the family *Pleuronectidæ*, or Flat-fishes, the most valuable of them all. The genus *Rhombus* has the body rhomboidal; the dorsal fin commencing immediately above the upper lip, and extending almost to the tail-fin; the eyes generally on the left side. The Brill (q. v.) belongs to it as well as the T., and some other less important fishes. The T. attains a large size, sometimes 70—90 lbs. weight. Its form is shorter, broader, and deeper than that of almost any other flat-fish. It is of a brown color on the upper surface, which is studded with hard roundish tubercles. Like the other flat-fishes, it generally keeps close to the bottom of the sea; and it is found chiefly on banks where there is a considerable depth of water. Some of the banks in the German Ocean abound in T.—as the Dogger Bank—and yield great quantities to the London market. The T., however, is also found, although more sparingly, in estuaries. In former times, it was chiefly caught by long lines; but of late, the greater part of the supply for the London market is obtained by beam-trawling (see TRAWLING). Few kinds of fish are more prized for the table than the turbot. —The AMERICAN or SPOTTED T. (*Rhombus maculatus*) is also highly esteemed for the table. It is common on the coasts of New England and New York. It attains a weight of 20 lbs. The breadth is about one-half of the length. The upper surface is smooth, reddish gray, with large circular or oblong darker blotches, and numerous white spots.

TURDI'DÆ. See MERULIDÆ.

TURENNE, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE, one of the most eminent of France's military heroes, was the second son of Henri, Duke of Bouillon, and Elizabeth of Nassau, the daughter of William I. of Nassau-Orange, the great assertor of the liberties of the Netherlands, and was born at Sedan, in the dep. of Ardennes, 11th September 1611. Brought up in the Reformed faith, he was sent, on the death of his father in 1623, to Holland, where, under his uncle, the celebrated Maurice (q. v.), he was initiated into the art of war. Returning to France in 1630, he was favorably received by Richelieu, who at once gave him a commission. In 1637, he was attached to the army of Bernard of Weimar, which at that time was engaged in Lorraine; and by bringing about the capture of Landrecies, Maubeuge, and other places, including the key of Western Germany, Brisach, gained such repute, that on his return to Paris (1638), he experienced quite a triumphal reception. The victories of Route and Casale in the Italian campaign of the following year, added to his laurels; and in 1641 he was for the first time intrusted with the supreme command. The rapid and thorough conquest of Roussillon from the Spaniards in 1642, was good proof of his masterly military genius, and was rewarded in 1643 with the baton of a marshal of France, and the chief command on the Rhine, where repeated reverses, a defective commissariat, and want of pay, had completely demoralized the army. But through a liberal expenditure of his own funds, and of loans obtained by him on his own security, the troops were speedily re-equipped; and by a victory over the Bavarians at Rottweil (1644), their *morale* was restored. Condé's arrival transferred him to a subordinate position; and his restoration to supreme command was followed by the commission of a glaring strategic error for which he was severely punished by his able and watchful opponent, Mercy, who completely routed him at Marienthal, 5th May 1645; but on August 3 of the same year, this disgrace was amply avenged by Condé at Nordlingen, where Mercy was slain; and T. gloriously concluded the war on the part of France by the reconquest of the Treves electorate, by the conquest of Bavaria in conjunction with the Swedes, and by a successful campaign in Flanders.

In the civil wars of the Fronde (q. v.), which immediately followed, T. joined the party of the *frondeurs*, of whom his elder brother was one of the principal leaders; but after being defeated at Rethel (December 15, 1650), he withdrew to Flanders, returning on Mazarin's retirement. On the minister's return, T. joined his party, while Condé deserted to the *frondeurs*, and the two greatest generals of the period were for the first time pitted against each other. T. was uniformly victorious over his former chief, though his forces were inferior in number; and ultimately forced him to retire from France; after which he subdued the revolted cities, crossed the northern frontier, and conquered much of the Spanish Netherlands. In 1667, on the outbreak of war between France and Holland, Louis XIV. created T. Marshal-general of France, and would have made him Constable, had he not been a Protestant. Indeed, the unorthodoxy of T. had for some time been a matter of grave concern to the bigoted young monarch, at whose suggestion Bossuet attempted the veteran's conversion by composing his celebrated *Exposition de la Doctrine Chrétienne*, which, backed by the king's repeated solicitations and remonstrances, and doubtless, as Voltaire suggests, by the more efficacious promptings of ambition, had ultimately the desired effect. T.'s campaign in Holland, in which he was nominally under Louis's command, was a most triumphant one; and the Elector of Brandenburg, who had ventured to side with the Dutch, was pursued to Berlin (1672), and forced to beg for peace. The emperor next took up arms on behalf of Holland, whereupon T. was transferred to the Upper Rhine. This, his last campaign, is foully disfigured by the horrible devastation of the Palatinate, executed under express orders, doubtless, but with a willing thoroughness which is utterly unjustifiable. After routing the Germans at Mulhausen and Turckheim, and forcing them across the Rhine, he was at last opposed to a worthy antagonist in Montecuculi (q. v.); but, unfortunately, their famous passage of strategy of nearly half a year's duration was left unfinished, T. being killed while reconnoitring the ground at Salzbach, with a view to a grand engagement. His grateful sovereign, to show that he made no distinction *entre porter le sceptre, et le bien soutenir*, ordered him to be entombed at Saint Denis, and funeral orations were pronounced for him by Flechier and Mascaron. T.'s monument suffered at the Revolution, and was ultimately placed by Napoleon under the dome of the Invalides. T. left Memoirs of his campaigns.

TURF LAWS. The laws concerning the ancient pastime of horse-racing are subdivided into those affecting races, wagers, and betting-houses, for which last, see BETTING. 1. As to racing, it

has sometimes been popularly believed that the public have a right to trespass on lands to attend or to hold races; but no such right exists. Hence the stewards or persons intrusted with the management and possession of the land for the time have a right, which is seldom enforced, to turn off any person they please from the grounds. A sweepstakes is a stake or fund, for which at least three entrances must be made, and the whole stake becomes, under certain regulations, the property of the winner. Many of the great races are not run within a year from the time the horses are entered. The owner of a horse entered can withdraw or 'scratch' him before the race is run. When the race is run, the successful party may sue for the amount of the stakes; and if the race is not run, or cannot be run, each subscriber may sue for recovery of his contribution; but no one can obtain his contribution, or countermand it, till the event has happened, for a sweepstakes is a legal contract to abide the result. If the stakes are contributed for an illegal game, it is otherwise; and before the stakes have been paid away, any contributor may sue for and recover his deposit. The stewards are the proper parties to decide all disputes about the fairness of a race, and their award is binding: if they cannot agree, then it will fall to be decided by a jury. —2. As to wagers. By the act 8 and 9 Vict. c. 109, s. 15, all wagers were declared void, except as regards subscriptions of money or plate to be awarded to the winner of a lawful game, sport, pastime, or exercise. If one makes a wager on a race, he may retract it any time before the event comes off, and require the money, if deposited, to be repaid; and no wager can be tried in any court of law or equity, so that the winner cannot compel payment. It is merely a debt of honor.

TURFAN, an important city in the east of Eastern Turkestan (which is sometimes named after it), on the southern slope of the Thian Shan Mountains. It consists of about 6000 houses.

TURGENEF (or TOURGUÉNIEF), IVAN SERGEJEVITSCH, one of the best modern Russian novelists, was born at Orel, 9th Nov. 1818, educated at Moscow and Berlin, and obtained a post under the minister of the interior. He became known as a poet in 1843. He was banished in 1852 for his liberalism; and though afterwards pardoned, has lived mostly at Paris and Baden. T. is a very prolific author; of his novels, the chief that have been translated are *Russian Life*, *Fathers and Sons*, *Smoke*, *Liza*, *Spring Floods*, and *Virgin Soil* (1877).

TURGOT, ANNE ROBERT JACQUES, French statesman, born in Paris, May 10, 1727, was descended from one of the oldest families in Normandy. T. was destined for an ecclesiastical career, but adopted by preference the profession of law. In 1761, he was appointed Intendant of Limoges, and administered the affairs of the province for thirteen years. He introduced a more equitable administration of imposts, and succeeded in abolishing the old method of repairing roads and bridges by the compulsory labor of the poor inhabitants of the district, called *corvées*. He also exerted himself in providing for the subsistence of the people and the protection of commerce. He introduced into the Limoges the cultivation of potatoes. A wider field opened before him on the death of Louis XV. The finances were in a terrible state of disorder, the whole social and political system of France needed regeneration and reform; and T. appeared to be the man to meet the crisis. He was first made Minister of Marine, and afterwards Comptroller-general of France, when to fill that post was to be virtually the Prime Minister. In his letter to Louis XVI., he adopted, as the principle of his administration, that there should be 'no bankruptcy, no augmentation of imposts, no loans;' yet he foresaw that the strength of the privileged classes, and the corrupt influence of those who profited by abuses, would be too much for him, and that against such enemies he could hardly hope to retain the confidence of the king.

His first task was so far to reduce the expenditure as to leave a surplus of 20 millions of francs a year, to be applied to the liquidation of old debts. He augmented the public revenue without imposing new taxes, and he introduced exactness of payments and fidelity of engagements into all his financial operations. One of his first measures was the carrying out of free-trade in corn throughout the interior of the kingdom. He constantly occupied himself with the amelioration of the condition of the people. He proposed to enfranchise the rural districts from statute labor, provinces from their barriers, commerce from internal duties, trade from its shackles, and, lastly, to make the nobility and clergy contribute to the taxes in the same proportion as the third estate. This great minister and virtuous citizen, of whom his colleague, Malesherbes, said: 'He has the head of Bacon, and the heart of L'Hopital,' wished, by means of provincial assemblies, to accustom the nation to public life, and prepare it for the restoration of the States-general. If the nobility and privileged classes had possessed enough of foresight and patriotism to submit to his plans for reforming France, she might have been spared the horrors and excesses of the Revolution. But his projects for the public good were defeated by the confederacy formed against him by nobles, courtiers, farmers of the revenue, and financiers. The king forsook him, although, at the same time, observing that T. and himself were the only persons who desired the welfare of the people. He retired, having held office for only twenty months. It is alleged against his practical talent for statesmanship, that he labored under a want of address, and that he did not sufficiently dissemble his hatred and contempt for the cowardice and baseness of those who fattened upon the abuses that were eating like an ulcer into the heart of France. After his retirement, he resumed his early worship of the Muses. His Latin inscription for the portrait of Franklin is a line of which any author might be proud: 'Eripuit cœlo fulmen, sceptrumque tyrannis.' He also devoted himself to physics and mathematics. His works are a mine of sound and original thought. His *Mémoire* on the American war expresses views on the nature of colonies which have since been adopted by the best writers. His work on *Usury* contains almost all that is of value in Bentham's *Letters on the Usury Laws*. He held general objections to charitable institutions. He died of gout, March 20, 1781, leaving behind him a memory which France will ever cherish with veneration.

TURI'N (*Augusta Taurinorum*, *Bodincomagus*, *Colonia Julia*, *Taurasia*—in Italian, *Torino*), a city of Northern Italy, formerly capital of Piedmont, then of the kingdom of Italy, is situated near the confluence of the Po and the Dora Ripaira, 45° 5′ N. lat., 7° 42′ E. long. Its pop. at the beginning of this century was 42,000 —in 1863, it was 235,000; now that it is no longer the capital, it is reduced to (1881) 226,307. It began to acquire importance when Amadeus V. declared it the capital of Savoy in 1418, built a castle there, and made it his residence. In 1620, Charles Emanuel I. enlarged the city by royal decree: it was still more enlarged in 1673 and in 1702. At the beginning of this century, the French destroyed and levelled the ramparts of the town, converting them into public promenades. Of late years, the moats and fortifications have been demolished, to make way for new streets towards Porta-Susa. In consequence of these improvements, T. has become one of the handsomest cities in Europe. It is famed for its handsome squares. Some of the finest are—Piazza San Carlo, surrounded by wide porticoes, and adorned by a fine equestrian statue of Emanuel Philibert of Savoy, by Marochetti; Piazza Castello, also surrounded by porticoes, which are prolonged down Via Po to the end of Piazza Vittorio Emanuele, the finest square in Europe for size, regularity of architecture, and beauty of situation; Piazza Carlo Felice, with porticoes and a fine garden; Piazza Carlo Alberto, with an equestrian statue of the king of that name by Marochetti; Piazza d'Armi, a vast open space for military exercises, flanked by the old and new arsenals of the kingdom. Leading out of Piazza Vittorio Emanuele, there is a handsome five-arched bridge across the Po, begun by Napoleon I., with money got by the sale of the jewels and votive offerings of the cathedral, and finished by the kings of Sardinia. Another fine bridge is that across the Dora, of one single arch, nearly straight, the work of the engineer Mosca.

Among the numerous churches, the principal are the cathedral of San Giovanni, a Gothic structure, built in the 7th c., and reconstructed in 1498; San Filippo, the handsomest church in T.; La Consolata; La Gran Madre di Dio; and a Waldensian temple. On the summit of a hill near the town is La Superga, a splendid Basilica, raised by Victor Amadeus to fulfil a vow, and now the mausoleum of the House of Savoy. Among the 'palaces,' must be noticed the royal palace, designed by Castellamonte, which is poor in outward appearance; the Carignano Palace, an odd building, by Guarini; the town-hall designed by Lanfranchi; the university, with 71 professorships and about 900 students, a library of 120,000 vols., and 2000 MSS.; the Accademia delle Scienze, with an Egyptian museum, the finest in Europe; the Seminary; the Hospital of San Giovanni. The private palaces are numerous and vast, but in a bad style of architecture. There is the Theater Royal; the Carignano Theater, designed by Alfieri; the Vittorio Emanuele, and many other theaters.

The manufactures of T. consist of woollen and silk fabrics, velvet hats, paper, pottery, leather, arms, and liqueurs. The population is sober, industrious, and generally well off.

T. was originally inhabited by the Taurinians, a tribe of Ligurians. It is first mentioned in history in the time of Hannibal, by whom it was taken and sacked, on his descent into Italy after crossing the Alps. T. became a royal colony, 166 B.C., and was called by Augustus, *Augusta Taurinorum*. On the fall of the Empire, it went to the Lombards, and became the capital of one of the 30 Lombard duchies. Charlemagne made it the residence of the Duke of Susa, whose line ruled till 1032, when the House of Savoy succeeded it. It was taken by the French in 1506, and held by them for nearly 60 years. They again took it in 1640; and in 1796, it was dismantled, and united to the French Empire in 1800 with the name of the department of the Po. In 1815, it was restored to the House of Savoy.

TURKESTA'N, 'the country of the Turks,' called also *Jagatai*, and by the Persians *Turan*, is an extensive region of Central Asia, stretching from the Caspian Sea eastward to beyond Lob-nor (long. 110° E.), and from Siberia and Dzungaria southward to Persia, Afghanistan, and Tibet. Until quite recently, it was supposed that the Bolor Tagh (q. v.), a mountain chain of the first magnitude, running north and south, divided it into two parts. English explorers entering T. from the south, and Russians from the north, have shown that no such range exists. Its place is taken so far, however, by a lofty table-land, the Pamir Steppe, which, sloping gently toward the east and west, separates the rivers running eastward to the desert of Gobi from those which run to the Sea of Aral. It separates T. into a western and an eastern portion.

WESTERN TURKESTAN, *Great Bukharia*, or simply *Turkestan* or *Turan*, consists of the great hollow plain of the Caspian and Aral Seas, which occupies its west and center, and of the hilly and well-watered districts formed by the ramifications of the Thian-shan Mountains and Hindu Kush. The plain is composed of deserts of loose shifting sand, interspersed with oases where a subsoil of clay renders the formation of lakelets of rain possible; strips of fertile land along the banks of rivers, and occasional tracts clad with coarse thin grass; the eastern districts abound in valleys of remarkable fertility. The climate varies on the plains from extreme cold to burning heat, and though, in the eastern highlands, the cold is almost as intense in winter, the heat of summer is much less. The rivers of T. are the Sir-Daria (see JAXARTES) and Amu-Daria (see OXUS); the Zer-Afshan, which rises on the south of the Asfera-tag, and flows westward for 400 miles, terminating in a small salt lake or marsh near Bokhara; and the Murghab, which rises in the mountains of Ghur, and after a west-north-west course of 450 miles, loses itself in a marsh beyond Merv. The vegetable products of the country are fruits, grain, cotton, flax, hemp, and tobacco. Silk is also produced in considerable amount. Forests can hardly be said to be at all represented in this extensive region. Salt is abundant, large tracts of desert being strongly impregnated and even crusted over with it; and sal ammoniac is common. Agriculture, and the breeding of the domestic animals, are the occupations of the great mass of the population; but manufacturing industry is also considerable. The produce consists of cotton, silk, linen, and woollen goods, shagreen (superior to that manufactured in Europe) and other kinds of leather, paper made of raw silk, carpets, and a few sabres, knives, and rifles.

Western T. is divided into Russian T., including Khokan (q. v.), now Ferghana, in the north and north-east; Khiva (q. v.), under Russian influence, in the west; Bokhara and its dependencies in the east and center; the country of the independent Turkomans, including the town of Merv; and Afghan T., including Badakshan (q. v.) and Kunduz, Balkh (q. v.), Maimaneh, Andkhui, and Sir-i-pul. The population comprises Uzbeks (q. v.), the dominant race, Turkomans, Karakalpaks, Kirghis (q. v.), Sarts or Tajiks, Persians, Kiptchaks, and a few Arabs, Hindus, and Jews. Of these, the Sarts or Tajiks, the original inhabitants of the cities, are of ancient Persian stock, and along with the Uzbeks, Hindus, and Jews, form the settled population; the Persians are either slaves, or, being introduced into T. as such, have obtained their freedom, and settled in the country; the other races are mostly nomad and predatory. The prevalent religion is Mohammedanism, and most of the tribes are Sunnites. A few Sheeahs, Sufis, and Buddhists are also found.

T. has played an important part in Asiatic history from the very earliest times. The contests between the Iranian and Turanian races occupy a prominent place in Firdusi's sketch of the semi-mythical traditions of Persia; and the earliest light of history shows us Bactriana (Balkh) and Sogdiana (Bokhara) as well cultivated and populous countries, generally attached to the Persian empire, and inhabited by Persians, to whom most of the prominent cities of T. owe their origin. With Persia, T. passed into the hands of the Macedonians, who made Bactria an independent Greek kingdom, while the rest was in possession of the Parthians. Under the Sassanides, the Persian boundary was again advanced to the Jaxartes; but the gradual gathering of Turkish tribes from the north-east on the right bank of that river, led to a constant state of warfare on the frontier, which ultimately resulted in the occupation of *Mawer-ul-Neher* ('the country between the rivers' i e., the Oxus and Jaxartes) and of Khaurezm (Khiva) by the invaders.

In the 8th c. of the Christian era, the Arabs possessed themselves of T., and during the decline of the califate, it became the seat of various minor dynasties, as the Samani (q. v.) in Mawer-ul-neher, and the shahs of Khaurezm; and after a brief union with the Seljuk empire in Persia, was mostly united to Khaurezm, and along with it overrun by the Mongol hordes under Genghis Khan (q. v.), on whose death it became one of the four divisions of his vast empire, and was allotted to his son Jagatai. On the decline of Jagatai's dynasty, Timûr (q. v.) rose to supreme authority in T., and in the course of a 35 years' reign, made it the center of an immense empire, which stretched from the Hellespont to the frontiers of China, and from Moscow to the Ganges. This period was the golden age of T.; its powerful monarch was never weary of adorning its cities with the spoils of victory; colonies of learned men, skilled artisans, and all whose knowledge or abilities could be of service to his subjects, were either tranferred to T. from the countries he had conquered, or induced by the most munificent offers to settle there; till under him and his more immediate successors, Samarkand became a focus of enlightenment and learning. But after the death of Shah Rokh, Timûr's youngest son, the empire was split up into numerous fragments; and after a time a new dynasty snatched Persia from Timûr's family, while the Uzbeks, under Sheibanî Khan, drove them (1500) from the country north of the Amu-Daria; one of the expelled princes, Mirza Baber, who had ruled in Ferghana (the south half of Khokan), subsequently founding the 'Great Mogul' empire in Hindustan. The Uzbek empire generally included Badakshan, Herat, and Meshed; but these were lost on its division, in 1658, into various independent khanates. Khiva was conquered by Nadir Shah in 1740, and Bokhara limited to the north bank of the Amu-Daria; but the Kirghis of the Little Horde restored the independence of Khiva, which they ruled till 1792, when the present Uzbek dynasty obtained the throne; and Shah Murad (1806—1822), celebrated under the appellation of *Beggee Jan*, effectually re-established its former extensive sway to the Bokhariot sceptre.

Khokan, after emancipating itself from the authority of Sheibanî's successors was incorporated with Bokhara; but afterwards united with the states of Eastern T.; and on their conquest by China, resumed its independence. The recent history of T. records a series of wars between Bokhara and Khokan, and Bokhara and Khiva, in which the Bokhariots had generally the advantage, owing to the aid of the Turkomans of the southern desert, whom they subsidized; the raids of the Turkomans along the northern frontier of Persia; the advance of the Afghans from the south-east; and the progress of Russian conquest from the north and west. To explain the Turkoman raids, a few additional words on the geography of T. are necessary. Between the deserts of T. and those of Persia lies a long and fertile tract running from the south-east of the Caspian to Herat, the 'key to India;' over it pass the great routes from Western to Eastern Asia. North of it, chiefly in the deserts, dwell the Turkomans, a population of one million of savage brigands and man-stealers, constantly engaged in marauding expeditions against the Northern Persians. They have desolated the frontier, and the atrocities they commit far exceed anything recorded of the African slave-trade. In 1860, Hanza Mirza, an uncle of the present shah, marched against them, but was defeated in attempting to capture their intrenchments in a marsh. On that occasion, 15,000 Persians and 30 guns were taken by the Turkomans. In 1865, a more successful expedition proceeded against Saraks, and the guns were recovered. Still the northern routes are in the hands of the Turkomans, more especially that leading by the Daman-i-koh Hills; and so late as 1872, reports appeared of Turkoman raids in Northern Persia. The south-eastern part of T. has also been the scene of recent strife. The Afghans have invaded it for the recovery of possessions they claimed north of the Hindu-Kush. In 1850, they took Balkh and Khulm, and in 1859, Kunduz, Badakshan at the same time submitting to pay a large tribute. The English and Russian governments seem now to recognize the claim of the Afghans to fix their frontier at the Oxus (see debate in House of Commons, 22d April 1873).

The Russians bid fair soon to absorb all that remains of independent Turkestan. In 1864, they invaded Khokan, and took Tashkend and Khokan. A struggle followed with Bokhara. On the 20th May 1866 was fought the battle of Irjar, the most important event in the recent history of Turkestan. The emir had to flee for his life, leaving his camp in the hands of the enemy. In 1868, the Russians, 8000 men, again advanced and crossed the river of Samarkand. The troops of the emir, 40,000 men, took te flight when they saw the Russians approach with their dreaded artillery, and on 14th June a treaty was concluded, by which Bokhara transferred to Russia Samarkand and all the territory north and east of it. Khiva still remained independent in the midst of its deserts. But early in 1873 an expedition in four divisions set out from the Russian frontier posts against Khiva, which fell in June of that year, after no great resistance. A great part of Khivan territory north of the Amu-Daria was ceded to the conquerors; and after a fierce struggle in 1875 and 1876 with the warlike inhabitants of Khokan, which is now the Russian province of Ferghâna, Russia formally annexed the whole. The news of the fall of Khiva was welcomed in this country as a triumph of civilization over barbarism; but the further annexation of Khokan provoked the fear that Russia will go on to annex other territories now in the hands of the Turkomans, including the northern routes to Herat. In 1879, the Russians attacked the Akhal Tekke Turkomans, living on the southern edge of the Kara Kum desert be-

tween the Caspian and Merv, but were repulsed. An expedition in 1880–81, under Skobeleff, ended in the total defeat and subjection of the Tekkes. See Vambery's *Bokhara;* Schuyler's *Turkestan;* Marvin's *Merv, Queen of the World* (1881); *Geog. Mag.*, 1875–76; *Proc. Geog. Soc.*, 1881; O'Donovan's *Merv Oasis* (1882).

EASTERN TURKESTAN, known also as *Upper Tartary, Chinese Turkestan, Little Bukharia,* and *Túrfan,* is bounded on the north by the Thian-shan Mountains, on the west by the Pamir tableland, and on the south by the highlands of Tibet or Cashmere. Towards the east it sinks to the desert plain of the Gobi, round the western bay of which it forms a vast crescent-shaped oasis from 4000 to 5000 feet in elevation, drained by the tributaries of the Tarim. This river flows eastward into the desert, and empties itself in the Lob-nor, after a course of 1500 miles. The Lob-nor, a lake or rather series of lakes and marshes, was visited by Colonel Prejevalsky in 1877. The region around it is very desolate and unattractive. Mr. Shaw the first Englishman who visited Eastern Turkestan, gave a very enthusiastic account of its capabilities as a field for English commerce as it was when under the late Emir, Yakoob Beg (see his report, 1871). Mr. Shaw described the plains as covered with corn-fields and orchards, though their fertility is dependent on irrigation. Canals ramify the country, sometimes crossing one another at three levels. But large areas are very unproductive; and though there are numerous villages and towns, some of them large, the population of the country as a whole—probably some 600,000—is but thin. The country produces gold and abundance of silk; and the inhabitants are skilful in making gold and silver stuffs, carpets, and linen, cotton, and silk goods. The political capital is Kashgar; the commercial capital, Yarkand. In the latter are numerous colleges and schools; in both there used to be an active trade, with resident representatives of most of the nations of Asia. But since the re-conquest of the country by China, anarchy prevails, and trade is for the time being destroyed; all the more as Kuldja, taken by the Russians from the rebels against Chinese authority in 1871, has been retained by Russia, in spite of Chinese protestations. In 1879, however, it was understood that Kuldja was to be restored to China. The inhabitants speak Turkish, but are said to be of Persian descent.

Little is known of Eastern T. previous to its conquest by Genghis Khan; but after the decay of his empire into petty states, among which are Kashgar, Yarkand, Aksu, and Khoten, the chiefs of these were constantly quarreling with each other—a temporary peace being occasionally produced by their subjection to some powerful neighbor—till several of the leaders, with the Yarkand prince at their head, invited the Chinese to take possession of the country, and in 1758 it became a povince of China. In 1864, however, a mutiny among the Chinese troops induced the dispossessed native chiefs to stir up a Mohammedan insurrection. They invited a Khokan prince, Buzurg Khan, to assume the government. Through his lieutenant Yakoob Beg, he dispersed the Chinese garrison left to defend the fort of Kashgar. But the lieutenant soon superseded him, and became sole Emir under the title of Athalik Ghazi. He possessed civil as well as military capacity, and raised the country to a state of considerable prosperity. He sent an envoy to Calcutta in 1872, and in 1873 Sir T. D. Forsyth visited Kashgar from the Indian government. But the Emir's position did not secure more intimate relations. He had since 1869 successfully resisted the encroachments of Russia, but in 1876 the Chinese again advanced, defeated him, and retook their old province in 1877. The Emir died shortly after. See Forsyth's *Report* (1875); *From Kulja, across the Tian Shan to Lob-Nor,* by Colonel N. Prejevalsky (1879); Boulger's *Life of Yakoob Beg* (1878).

TU'RKEY, or the OTTOMAN EMPIRE (q. v.), includes large portions of the continents of Europe, Asia, and Africa, and consists of Turkey Proper, which is under the direct rule of the sultan, and of several dependent and tributary states. The arrangements sanctioned by the Berlin Congress in 1878 have largely changed the size and organization of the empire. Turkish affairs could not soon be expected to settle into equilibrium; and on most subjects reliable statistical results are at best approximate. In any case, it is necessary for an understanding of Turkey as it now is, to begin with Turkey as it was before the last momentous war with Russia.

The *Almanach de Gotha* of 1878 gave the following estimates of the area and population of the Turkish empire before the sweeping changes agreed to at Berlin:

	Sq. Miles.	Population.
I. Immediate Possessions—		
In Europe	139,824	9,400,364
In Asia and Africa	1,083,673	18,079,112
District of Constantinople	....	1,400,000
Nomadic races	....	2,000,000
Army and Police	....	560,262
Foreign residents in Turkey	....	500,000
	1,223,497	31,939,738
II. Protectorates—		
In Europe { Roumania	46,617	5,073,000
In Europe { Servia	14,549	1,367,000
In Africa { Egypt	866,012	17,000,000
In Africa { Tunis	45,538	2,000,000
III. Tributary Principality of Samos	212	35,878
	972,928	25,475,878
Turkish Empire	2,196,425	57,415,616

Montenegro, formerly a tributary state, had been virtually independent for many years.

The population of the various provinces, even of European Turkey, has always been difficult to ascertain. The most satisfactory estimate was probably one made before the vilayet of Herzegovina was separated from Bosnia, and published in 1876 in the Vienna journal, *Monatsschrift für den Orient.* This was based on the *Salnamés,* or official almanacs of the vilayets, and shows at the same time the distribution of the religions in the provinces, but it takes account only of the male population.

	Moslems.	Non-Moslems.
Vilayet of Bosnia	309,522	306,707
" Monastir	485,993	417,805
" Janina	250,749	467,601
" Salonica	124,828	124,157
" Adrianople	235,587	401,148
" Danube	455,767	715,938
	1,862,446	2,433,356

Constantinople, not included in any of the six vilayets, had a total population of 680,000. The total male population of European T., excluding the vassal provinces, was 4,976,000. The entire population of both sexes might, therefore, be assumed to exceed 10,000,000. The proportion of Non-Moslems to Moslems given above (57 to 43) probably understates the numerical predominance of the former.

Many of these estimates have of course become obsolete since the Berlin Congress of 1878 (see History of the OTTOMAN EMPIRE). This Congress, which met primarily to revise the 'preliminary' treaty of San Stefano, concluded between Russia and Turkey at the close of the war of 1877–78, has revolutionized the relation of the Porte to the subject Christian principalities and provinces, alienated large portions of hitherto Turkish territory, and inaugurated what must necessarily be a new era in the history of the Ottoman empire. The principal results of the Congress's work are treated under the several heads of the states they chiefly concern (see ROUMANIA, SERVIA, MONTENEGRO, BULGARIA, &c.), but must here be briefly summarized.

The vassal states Roumania and Servia, as well as Montenegro, were declared independent, and each obtained a change or extension of territory; Roumania, which had to yield up its portion of Bessarabia to Russia, received in compensation the Dobrudscha, cut off by a line from Silistria to Mangalia. Servia was considerably extended to the south. Montenegro received an important addition to its territory, chiefly on the Albanian side, including the port of Antivari. (Dulcigno with its district was added in 1880.) What was formerly the Turkish vilayet of the Danube, was, with the exception of the Dobrudscha, now Roumanian, made into the tributary but automatic principality of Bulgaria, its southern boundary being the Balkan range. A large territory to the south of the Balkans was organized as the separate province of Eastern Roumelia, and though remaining directly under the military and political authority of the Sultan, secured the right of having a Christian governor-general and administrative autonomy.

It was agreed that Herzegovina and Bosnia, excepting a small portion of the latter, should be occupied and administered by Austro-Hungary, and thus in large measure alienated from the Porte; Spizza and its sea-board, immediately north of Antivari, was incorporated with Dalmatia; Greece was to receive additional territory; the Congress recommending that the rectified frontier should run up the Salambria River from its mouth, cross the ridge dividing ancient Thessaly from Epirus, cut off the town of Janina so as to leave it to Greece, and descend the Kalamas River to the Ionian Sea. In Crete the reformed government promised in 1868 was to be immediately and scrupulously carried out. In Asia the changes were much less considerable; the port of Batum, henceforth to be essentially commercial, Kars and Ardahan, with a portion of Armenia, were ceded to Russia, and Khotour, east of Lake Van, to Persia; the Porte engaging to carry out at once much needed administrative reforms in Armenia and elsewhere. By the 'conditional convention' made in 1878 between Turkey and the United Kingdom, the English government undertook to defend the Porte's dominions in Asia, and received in return the right to occupy and administer Cyprus. The rectification of the Greek frontier was not arranged till 1881. After endless negotia-

(To Turkey)

tions and procrastination, which for a while seemed almost certain to lead to war, the Porte agreed to cede, and Greece to accept, a considerable portion of territory, though less than the Congress of Berlin had recommended. The new frontier gives to Greece all Thessaly south of the watershed forming the northern boundary of the valley of the Salambria (anc. *Peneus*), including the towns of Larissa and Trikhala; and in Epirus follows the line of the Arta River, leaving the town of Arta to Greece. The fortifications of Prevesa are to be destroyed by the Turks, and the Gulf of Arta is to be neutral.

The area and population of Turkey in Europe have now to be thus arranged:

	Sq. Miles.	Population.
I. Immediate Possessions	64,000	4,550,000
II. Autonomous Province of Eastern Roumelia	13,500	815,500
III. Bosnia and Herzegovina (with Novi-Bazar)	23,000	1,326,500
IV. Tributary Principality of Bulgaria	24,500	1,965,500
Total of Turkey in Europe	125,000	8,657,500

TURKEY IN EUROPE, generally hilly and undulating, is traversed by a mountain system which has its origin in the Alps, enters T. at the north-west corner, and runs nearly parallel to the coast, under the names of the Dinaric Alps and Mount Pindus, as far as the Greek frontier. This range sends numerous offshoots east and west; the great eastern offshot being the Balkans (q. v.) range, with its numerous branches to north and south. The rivers of Turkey are chiefly the tributaries of the Danube; the Maritza, Strumo, Vardar; the Narenta, Drin, and Voyutza.

On the high lands, the cold is excessive in winter, owing to the north-east winds, which blow from the bleak and icy steppes of Southern Russia; and the heat of summer is almost insupportable in the western valleys. Violent climatic change is, on the whole, the rule in European Turkey; but those districts which are sheltered from the cold winds, as the Albanian valleys, enjoy a comparatively equable temperature. The soil is for the most part very fertile; but owing to the positive discouragement of industry by the oppressive system of taxation which was long in force, little progress has been made in the art of agriculture, and the most primitive implements are in common use. The cultivated products include most of those usual in Central and Southern Europe—viz., maize, rice, cotton, rye, barley, and millet. The mineral products are, iron in abundance, argentiferous lead ore, copper, sulphur, salt, alum, and a little gold, but no coal. The wild animals are the wild boar, bear, wolf, wild dog, civet, chamois, wild ox, and those others which are generally distributed in Europe. The lion was formerly an inhabitant of the Thessalian Mountains.

TURKEY IN ASIA.—This portion of the Turkish empire is more hilly than the other. The two almost parallel ranges, Taurus and Anti-Taurus, which are the basis of its mountain-system, cover almost the whole of the peninsula of Asia Minor or Anatolia (q. v.), with their ramifications and offshoots, forming the surface into elevated plateaux, deep valleys, and enclosed plains. From the Taurus chain, the Lebanon range proceeds southwards parallel to the coast of Syria, and diminishing in elevation in Palestine, terminates on the Red Sea coast at Sinai. The Euphrates, Tigris, Orontes, and Kizil-Ermak are the chief rivers. On the whole, Turkey in Asia is ill supplied with water; and though the mountain slopes afford abundance of excellent pasture, the plains, and many of the valleys, especially those of the Euphrates, Tigris, and Jordan, are reduced by the parching droughts of summer to the condition of sandy deserts. In ancient times, these now desert districts were preserved in a state of fertility by artificial irrigation; but during the six centuries of almost constant war which convulsed this once fair region, the canals were neglected, and have, ever since the rise of the Osmanli power, remained in an unserviceable condition. Nevertheless, the fertile portions produce abundance of wheat, barley, rice, maize, tobacco, hemp, flax, and cotton; the cedar, cypress, and evergreen oak flourish on the mountain-slopes; the sycamore and mulberry on the lower hills; and the olive, fig, citron, orange, pomegranate, and vine on the low lands. The mineral products are iron, copper, lead, alum, silver, rock-salt, coal (in Syria), and limestone. The fauna includes the lion (east of the Euphrates), the hyena, lynx, panther, leopard, buffalo, wild boar, wild ass, bear, wolf, jackal, jerboa, and many others; and the camel and dromedary increase the ordinary list of domestic animals.

Possessions in Africa.—Tripoli is a vilayet of the Ottoman Empire. Egypt, under its hereditary khedive, is still tributary to the Porte, though of late years the relations of the tributary state to its suzerain have been gradually becoming looser. Tunis, till 1881 under Turkish suzerainty, is since that year practically a French protectorate. See the articles TRIPOLI, EGYPT, TUNIS.

Industry, Manufactures, and Trade.—Notwithstanding the primitive state of agriculture in T., the extreme fertility of the soil makes ample amends for this defect. The products are wax, raisins, dried figs, olive oil, silks, red cloth, dressed goat-skins, excellent morocco, saddlery, swords of superior quality, shawls, carpets, dye-stuffs, embroidery, essential oils, attar of roses, opium, corn, plum-brandy, &c. The exports include also wool, goats' hair, meerschaum clay, honey, sponges, drugs, madder, gall-nuts, various gums and resins, and excellent wines; the imports are manufactured goods of all kinds, glass, pottery, arms, paper, cutlery, steel, amber, &c. Previous to the recent Russian war the average annual value of the imports of Turkey in Europe was estimated at £18,500,000, and the exports at £10,000,000. Trade has dwindled to about one-third of its former dimensions since the war. The exports from the whole of the Turkish Empire to Great Britain amounted, in 1879, to £7,705,594; and the imports thence to £3,473,461. The countries which trade with T. are, in order of importance, Persia, Great Britain, France, Austria, Russia, Egypt, &c.; and the principal ports of the empire are Constantinople, Trebizond, and Smyrna. The mercantile marine of Turkey is small. In 1879 it comprised only some 230 sea-going ships (a dozen of them steamers), of a total tonnage of 34,800 tons. In 1878 there were over 780 miles of railway open for traffic in European Turkey; in the Asiatic part of the empire, about 175 miles.

Population.—A more heterogenous aggregation of races than that which constitutes the population of the Turkish empire can hardly be conceived. Turks, Greeks, Slavs, Roumanians, Albanians, are largely represented, besides Armenians, Jews, Circassians, &c., and Frank residents. In European Turkey, the Turks are estimated at 2,200,000; the Slavs, including the Bulgarians of the principality, at near 2,000,000; the Greeks at 1,030,000; the Albanians at 1,250,000; and the Roumanians at 1,000,000. Then in Asia there may be 4,450,000 Turks, not to speak of those in Africa; of Turkomans, 100,000; of Kurds, 1,000,000; of Syrians, 190,000—all in Asia: 1,000,000 Greeks; 2,400,000 Armenians (partly in Europe); as well as Jews, Arabs (in Asia and Africa), Druses, Franks or Western Christians, Gipsies, Tartars, Circassians and other kindred races, Copts, Nubians, Berbers, &c. Of these, the Greeks and Armenians are traders; the Slavic people and the Albanians are the chief agriculturists in Europe, and the Osmanlis, Armenians, Syrians, and Druses in Asia. Of the whole population about 25,000,000 are Mohammedans, and 15,300,000 Greek and Armenian Christians.

Administration, Religion, Education.—The government of T. has always been a pure despotism; the constitution granted in 1876 and revoked in 1878 was only nominal. The power of the Sultan (also called Padishah, Grand Seignior, Khan and Hunkiar) is much limited by the *sheikh-ul-islam*, the chief of the *Ulemas* (q. v.), who has the power of objecting to any of the sultan's decrees, and frequently possesses more authority over the people than his sovereign. The supreme head of the administration, and the next in rank to the sultan, is the grand vizier (*sadri-azam*), under whom are the members of the cabinet or divan (*menasybi-divaniié*), including the president of the council, the ministers of foreign affairs, of war, of the navy, of artillery, of the interior, of justice, of finances, and the other heads of departments of the administration. Governmental crises are frequent, especially of late; but palace intrigues are always a chief power in the state. The governors of the *vilayets*, or provinces, are styled *valis;* each vilayet is divided into *sanjaks*, or *livas*, ruled by inferior officers; each liva containing a number of *cazas*, or districts; and each caza a number of *nahiyehs*.

The provincial governors have no longer the power of life and death; and their power of practising extortion on those under their rule has been greatly diminished. The variable imposts are, however, farmed, but considerable restrictions are imposed on the farmers to prevent oppression. The established religion is Mohammedanism, but all other creeds are recognized and tolerated; and since 1856, a Mussulman has been free to change his religion at pleasure, without becoming liable to capital punishment, as was formerly the case. Education was long neglected, but in 1847 a new system was introduced; and since then, schools for elementary instruction have been established throughout T.; and middle schools for higher education, and colleges for the teaching of medicine, agriculture, naval and military science, &c. Many wealthy Turks, however, send their sons to France or Britain to be educated. The newspapers published in T. are not all printed in Turkish: several of them are printed in Greek, French, and other languages.

Revenue and Debt.—The Turkish government has never published an account of the actual revenue and expenditure of the empire. Estimates were given: but the budgets were so constructed as either to show a surplus, or to make the income and disbursements balance one another, while it was notorious that there were heavy deficits year by year. Years before the war of 1877, the Turkish exchequer was evidently on the brink of in

solvency, as was manifested by the violent expedients proposed for escaping from part of its liabilities. In 1875 a decree reduced the interest payable on the debt to one-half the proper amount; and another decree in 1876 announced that no further payments would be made till the internal affairs of the empire should allow of it. The enormous expenditure of the war, and the loss of valuable provinces, have only added to the utter disorganization of Turkish finances.

The first budget that admitted a deficit was that of 1874–75, where the revenue was given at £22,552,300, and the expenditure at £22,849,610. In 1875–76 the revenue was estimated at £19,106,352, and the expenditure at £23,143,276. In 1878–79, the revenue was guessed at £14,000,000; expenditure (with part of the war expenses), £50,000,000. At the end of 1880, the *Times* estimated the available annual revenue at £9,450,000, and the budget expenditure was nearly £12,000,000.

Between 1854 and 1874, when the borrowing power of T. came to an end, fourteen several loans had been contracted to meet deficiencies. At the end of that period, the foreign debt of T. amounted to £184,981,783. The internal and floating debt was stated in 1878 at £75,000,000; and the government had issued vast quantities of *caimés* or paper money, probably to the nominal value of £90,000,000.

Navy and Army.—The navy consisted in 1878 of 15 large armor-clad vessels, 18 smaller iron-clads, and 45 other steamers. During the war of 1877–78, five iron-clads and three other steamers were sunk or taken; and since, three iron-clads have been sold to England.

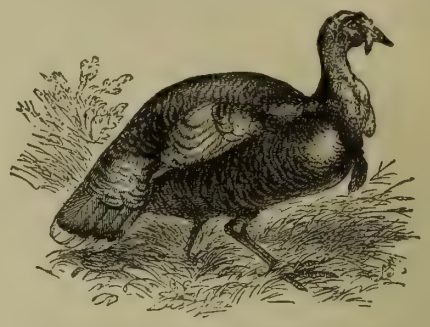
In the course of the war with Russia, T. contrived to put on a war footing no less than 752,000 men, including reserve and irregular troops. At the end of the war, the disorganized remnant amounted to about 120,000 men. Extraordinary efforts have been made to keep up the army: in 1880, when it had seemed necessary to call out the reserves, the empire actually had an army of 300,000 men, well armed and fairly equipped. According to the reorganization progressing in 1880, the military forces of the empire consist of active army (*nizam*), two 'bans' of landwehr (*redif*), and a landsturm (*mustafiz*). When the reorganization is complete, there should be, on the war footing, an available force of 468,000 infantry, 64,800 cavalry, 57,600 artillery, 10,800 pioneers, and 9000 of the military train; total, 610,200 men.

TURKEY (*Meleagris*), a genus of gallinaceous birds of the family *Pavonidæ*, or, according to some ornithologists, of a distinct family, *Meleagridæ*, both, however, being included by others in *Phasianidæ*. The head is bare, the neck wattled, and the bill of the male surmounted with a conical fleshy caruncle, sometimes erected, sometimes elongated and pendulous. A curious tuft of long hair springs from the base of the neck of the male, and hangs down on the breast. The bill is rather short, strong, and curved; the tail is broad and rounded, capable of being erected and spread out, as the male delights to do when he struts about in pride, with wings rubbing on the ground, uttering his loud peculiar *gobble*. The COMMON T. (*M. gallo-pavo*), the largest of gallinaceous birds, well known as an inmate of our poultry-yards, is a native of North America. It appears to have been introduced into Europe in the beginning of the 16th c., and is naturalized in some places; as it may be said to have been in the royal park of Richmond, near London, in the first half of the 18th c., when that park contained about two thousand turkeys; but in consequence of the frequent fights between poachers and keepers, it was thought proper to destroy them. Fewer attempts have been made than might have been expected to introduce the T. in parks and woods in Britain, where it might probably be expected to succeed as well as the pheasant. In a domesticated state, the T. varies much in plumage; in its wild state, this is not the case. The plumage of the wild T. is also richer, and its power of wing greater; but the wings even of the wild bird are short, scarcely extending beyond the base of the tail. The darkest-colored of domesticated turkeys most nearly resemble the wild T. in plumage. In its native woods, it seems to attain even a larger size than in the poultry-yard.

Turkeys were once plentiful in the forests of the Atlantic states of North America, and as far north as Lower Canada, but have disappeared as cultivation has advanced, and have become rare even in the eastern parts of the Valley of the Mississippi, where their numbers were once very great. The T. is found as far south as the Isthmus of Darien, but does not occur to the west of the Rocky Mountains. It inhabits the woods of the larger islands of the West Indies. In warm climates, it is said to produce two or three broods a year; but in colder countries it produces only one. The males associate in flocks of from ten to one hundred, and seek their food during great part of the year apart from the females, which go about singly with their young, or associate in flocks, avoiding the old males, which are apt to attack and destroy the young. At the pairing-time, desperate combats take place among the males. Wild turkeys roost on trees. They feed on all kinds of grain, seeds, fruits, grass, insects, and even on young frogs and lizards. They make their nests on the ground, merely gathering together a few dry leaves, and often in a thicket. The eggs are usually from nine to fifteen in number, sometimes twenty. They spread themselves in summer over the higher grounds; but in winter, congregate in the rich low valleys. The sexes mingle in winter, and form larger flocks than in summer.

On account of its size, and the excellence of its flesh and eggs, the T. is one of the most valued kinds of poultry. The management of it differs little from that of the common fowl. The young are tender for the first few weeks, and require care, particularly to keep them from getting wet by running among wet grass, or the like; but afterwards they are sufficiently hardy. Nettles are excellent food for turkeys, and are often chopped up for them, to be given in addition to grain, bran, boiled potatoes, and other such food.

The only other known species of T. is *Meleagris ocellata*, a native of the warmest parts of North America. It is not quite so



American Wild Turkey (*Meleagris ocellata*).

large as the Common T., and has a smaller tail. The neck is less wattled, but the head has a number of fleshy tubercles. The plumage is beautiful, rivaling that of the peacock in metallic brilliancy: blue, green, bronze, red, and golden hues being intimately and finely mingled, and forming *eyes* on the tail; whence the specific name.

TURKEY BUZZARD. See VULTURE.

TURKEY-RED. This celebrated color—the most durable, and perhaps one of the most beautiful which has yet been produced on cotton—is dyed by a process supposed to have been practised in India from immemorial time. It passed from thence through other parts of Asia to the countries of the Levant, and was introduced into France about the middle of last century. The first successful attempt to introduce it into Great Britain was made in Glasgow in 1783, by a Rouen dyer named Papillon, in conjunction with Mr. George Macintosh, the father of the inventor of waterproof cloth. They established the celebrated Turkey-red business now carried on by Messrs. Henry Monteith & Co. By an agreement with the Trustees for Manufactures in Scotland, Papillon allowed them to make his process public in 1803; and since then, Turkey-red dyeing has been extensively carried on in Glasgow and its neighborhood, and also in Lancashire.

There is a mode of dyeing cotton red with madder practised by calico-printers—the cloth being previously bleached with chloride of lime—where the whole process only occupies a day or two. But in the case of Turkey-red, which is also a madder-dye, the operations are long and tedious, and the bleaching with chloride of lime especially objectionable. The following is an outline of the steps in the Turkey-red process, as usually conducted: 1. Unbleached calico is thoroughly washed at a dash-wheel or other washing-machine, and then boiled for some time in a solution of carbonate of soda. 2. The cloth is soaked in a bath containing a soapy emulsion of olive oil, sheep's dung, carbonate of soda, and water; and allowed to remain for a week or more impregnated with the solution, after which it is aired in the field, and dried in stoves. This operation is repeated at least three times. 3. The next stage, sometimes called 'liquoring,' consists in passing the cloth through an emulsion of olive oil and carbonate of soda, but without sheep's dung; after which it is aired in the field, and dried in stoves, as in the last operation. The 'liquoring' is repeated at least four times. 4. The cloth now requires to be soaked in a weak alkaline lye of pearl-ash and soda, in order to remove any excess of oil. 5. The cloth is warmed in a bath containing a mixture of powdered oak-galls and sumach, or either of these substances alone, the operation being sometimes called 'galling,' and sometimes 'sumaching.' 6. The cloth is next steeped for twelve hours in a solution of alum, partially neutralized by carbonate of soda, but sometimes acetate of alumina is used instead of alum. Without this treatment, the dye could not be fixed upon the cotton. See DYEING. 7. When thoroughly washed, the cloth is ready to receive the red dye, which is produced by immersing it in a decoction of madder, to which some chalk and

bullock's blood are sometimes added. It is put into the dye-beck when cold, and kept in it for two hours after it has been raised to the boiling-point. 8. It is next boiled in a weak solution of soap and soda, which removes a brown coloring matter present in the madder-dye, but more fugitive than the red portion. 9. Finally, the dyed cloth is cleared or brightened by boiling it in a solution of chloride of tin, and then washing and drying it. A more recent plan is to employ chloride of lime for the clearing.

The theory of Turkey-red dyeing is not well understood, which so far accounts for the fact, that it has been found impossible materially to shorten the process. The three most essential operations are the oiling, or rather the impregnation with an oleaginous soap, the mordanting with alumina, and the dyeing with madder; but it is found, that if any of the numerous dippings in the oily emulsions are left out, the color is inferior in proportion to the number of omissions. This is the least understood part of the process, and is no doubt the cause of the rich appearance of the dye, which approaches some of the fine reds produced on wool.

Besides being largely used in its plain state, Turkey-red cloth is extensively employed for handkerchiefs with white patterns produced produced upon them by discharging the color (see BANDANA); and of late years articles of various kinds, with patterns in several colors, have been produced by ordinary calico-printing machines, where, by proper arrangements, the different colors are obtained on parts where the red color is discharged by chloride of lime.

TURKEY-STONE. See HONES.

TURKISH LANGUAGE AND LITERATURE. The Turkish is one of the Turanian (q. v.) idioms, and is chiefly divided into Eastern and Western Turkish. The former is mainly represented by the Uigur (Jagatai), an idiom but recently recognized not only to belong to the Turkic stock, but to be its most ancient representative. Its forms are fuller and more pure, albeit, to a certain extent, harder and rougher. Its alphabet is formed from the Zabian, out of which have sprung also the Mongol and Mantshu. Besides this, the Kiptchak, spoken in Kasan and Astrakhan, forms a principal branch of the Eastern Turkish, for which, however, but little has hitherto been done from a philological point of view.

Of infinitely higher importance, however, is the Western Turkish, or language of the Osmanlis, which, through the conquests of that race, has spread far and wide over the whole of Western Asia, the Levant, and parts of Europe. The Osman or Western Turkish (emphatically Turkish) is more melodious and soft than the former, and so much mixed with foreign elements, chiefly Arabic and Persian, that, were it not for its grammar, which is purely Tatarian, it could hardly be called an original language, but rather a conglomeration of the three respective idioms. Besides, it has also received a large increase of words from other Asiatic and European languages, e. g., the Chinese, Greek, and Italian. It is one of the most widely spoken idioms; not only Western Asia, but even the east of Europe, use this tongue to a great extent for commercial and political transactions. The characters in which it is now written are no longer the original Uigur letters, but the Arabic, the 28 characters of which have been increased by the four additional Persian characters—produced by further diacritical points, and a new one of their own, amounting in all to 33, which are written from right to left, as is the case in all (save one) Semitic languages. But this alphabet is not well suited to a language composed, like this, of elements belonging to the three great families of speech, viz., Semitic, Indo-European, and Turanic.

Neither the vowels nor the consonants are adequately represented in all cases. Occasionally, however, it is also written in Armenian characters, which renders its sounds much more faithfully. There is no definite article or gender. The plural is indicated by a final *lar* or *ler*, and the cases are formed by the addition of *ung*, *eh*, *i*, *den*, and *le* for gen., dat., accus., abl., and instrumental respectively; which are, in plural, affixed to the *ler* or *lar*. The adjective has no flexion, but is placed unchanged after the noun. Diminutives are formed, somewhat like in Italian, by suffixes. The comparative and superlative are formed by circumlocution. The personal pronouns are without gender, and their declension is like that of the nouns. The possessive pronouns are made by suffixes. The Turkish verb is of a very complex nature. There are seven *genera* (Active, Passive, Negative, Impossible, Causal, Reciprocal, Reflexive), all of which are formed by certain monosyllables affixed or prefixed. The root of the verb is the second person singular imperative, to which the infinite affix *mak* or *mek* is joined. The moods and tenses are formed chiefly by the addition of the respective forms of the auxiliary verb *olmak*, to be. Apart from this, there are special particles to express the optative, conjunctive, &c. Conjunctions are either formed by gerundives or possessive forms, or they are borrowed from Persian and Arabic. Adverbs are formed by certain suffixes. The Turkish construction is most peculiar: the genitive always precedes the nominative, and the verb always stands at the end. All this gives the Turkish style a peculiarly artificial and inverted appearance, and often a sentence cannot be in the least comprehended until it is quite finished. Oriental flourishes, and allegorical figures of speech, with which Turkish is very lavish, do not tend to facilitate the study of the language.

The original literature of Turkey is to be found in the scanty remains of the Uigur period. That remote eastern branch of the Turkish family had, after their emigration from their homes, south of the Lake Baikal, to the Tangnu Tagh, played a foremost part in the contests and migrations of Central Asia, until they disappeared in the Mongol Empire about 1200 A.D. They were acquainted with Chinese literature, and had adopted the Buddhist doctrines to a certain extent, and their scanty literary relics bear traces of these influences. When, however, the Turks, in the 11th c., began their conquest of the countries of Mohammedan Asia, they learned to appreciate the literature of Persia, then beginning to grow up in its full glory; and ever since Turkish literature and Turkish language have retained a strong Persian impression. Two branches of Turkish literature are usually distinguished—first, the Eastern or Jagataian, which chiefly flourished between Timur's and Baber's time (1400—1530). Mir Ali Shir, the vizier of Sultan Hussein, is the most renowned poet of this period. He also collected the most ancient Jagatai poems. Sultan Baber, also belonging to this epoch, wrote Memoirs of his life and time (translated into English), which are of considerable importance. The other or Turkish literature, principally so called, is exceedingly rich, but hardly deserving the name of an original literature, it being, for the greatest part, a mere imitation of Persian and Arabic models. Of early writers, deserve special mention Sheikhi, a romantic poet and physician, and Soleyman Tchelebi. In the 16th c., the most flourishing period of Turkey, we find Meshihi, the poet; Kemal Pasha Zadeh, the historian and jurist. In history, we have, besides annalists like Saad-ed-Din, historians like Mohammed Effendi. Of the same epoch is Lamii, who excelled in many branches of literature, besides being an accomplished translator of Persian poets. Fasli (d. 1563) and Baki, the chief of Turkish poets (d. 1600), conclude this period, which is followed by another of great activity, but of inferior rank. It boasts of Nebi, the poet; Nefi, the satirist; but above all, Hadji Khalifah (q. v.), the eminent historian, geographer, and encyclopædist. Raghib Pasha stands out in the 18th c., together with Said Rufet Effendi, and a number of smaller writers.

Little is to be told of the present stage of Turkish literature; but there is a great activity now visible in the province of educational works, and the reproduction of ancient writings; a feature which augurs well for the future. Davids' (Lond. 1836), Redhouse's (Par. 1846), and Kasem-Beg's (Kasan, 1845; Ger. by Zenker, 1847) are the best known Turkish grammars; and Kieffer and Bianchi's (*Dictionnaire Turc-Française*, 2 vols., Par. 1835), as well as Redhouse's and Zenker's, among the best dictionaries of the Turkish language.

TURKMANSHAI, a village of Azerbijan, 65 miles east-south-east from Tabriz, is the place where, on February 22, 1828, was concluded the treaty between Persia and Russia, by which the former resigned to the latter the provinces of Erivan and Nakchevan.

TURKS, the name of a numerous, important, and widely-spread family of the human race, members of which are to be found as well on the banks of the Lena in Siberia, as on those of the Danube and the shores of the Adriatic in Europe. The T. belong to the second of Blumenbach's five great divisions of mankind—viz., *Mongolians;* and to the first, or *Mongolidæ*, in Dr. Latham's three-fold classification. In this latter classification, the T. form a branch of the Turanian stock of Altaic Mongolidæ. Their geographical distribution, according to Dr. Latham, is as follows: '1. As a continuous population. East and west; from the neighborhood of the Lake Baikal, 110° E. long., to the eastern boundaries of the Greek and Slavonic countries of Europe, about 21° E. long. North and south; from the northern frontiers of Tibet and Persia, about 34° N. lat., to the country north of Tobolsk, about 59° N. lat. 2. As an isolated population. Along the lower course of the Lena, and the shores of the White Sea, chiefly within the Arctic Circle. 3. As portions of a mixed population in China, Tibet, Mongolia, Persia, Armenia, the Caucasian countries, Syria, Egypt, Barbary, Greece, Albania, and the Slavonic portion of Turkey in Europe.' The names Tourkoi, Turkai, and Turcæ occur in some ancient authors as applied to a Scythian people dwelling in Asiatic Sarmatia, and it is very likely that the Scythians of antiquity were allied in blood with the numerous existing Turkish tribes, if not absolutely their ancestors.

The original seat of the T. was probably upon the northern slopes of the Altai range, from which, while a portion emigrated into Independent Turkestan, others, going south-south-east, established themselves upon the confines of the Chinese Empire. MM. Abel-Rémusat, Klaproth, Ritter, and other high authorities, concur in tracing all the now existing Turkish tribes to the Hiong-nu, a

powerful nation who, prior to the Christian era, threatened to overrun and subjugate China, and who then occupied the whole of the vast region now called Mongolia, from the north of China to Mount Altai. Dr. Prichard coincides in this opinion. The Hiong-nu (or *Vile Slaves*, so called by the Chinese), indeed, for some time succeeded in establishing a kind of rule in China, and even intermarried with the imperial family; but about the commencement of the Christian era, their power in China began to wane, and before the end of the 2d c. they were driven back as far as Independent Turkestan. 'After the fall of the empire of Hiong-no,' says Prichard, 'the T. are known in Chinese history by the name of Thu-k'iú, or Turks, and Whey-ou-eul, by Europeans written Huy-hurs, and more correctly, Uigours. The Uigours, or Eastern Turks, whose history has been elucidated by Abel-Rému-sat, are the link of connection between these more remote nations and the Seljuki and Osmanli Turks, who are known to European historians.'

After the fall of the Hiong-nu empire in China, the tribes who composed its strength separated, some maintaining themselves in their acquired settlements, and even conquering portions of China; but by far the greater number spread westward over Western Mongolia, East and West Turkestan, and Southern Siberia, and gradually lost their power and unity as a nation. Out of this débris of a fallen people arose, in the 5th c., the great empire (the empire of Kiptchak) of the Thu-k'iú, which contested the supremacy of Central Asia with the Chinese on the east, and the Sassanidæ (q. v.) on the west, ultimately falling in 744 before the Hoei-he, a confederation of Turkish Tribes which had hitherto been subject to it.

The Hoei-he, attacked in the west by the Hakas (the ancestors of the present Kirghis), yielded to their assailants in 848, but retained their power east of the Bolor-tagh, and for 150 years longer ruled supreme from that range to the Hoang-ho. During the eight centuries succeeding their expulsion from China, a regular though slow progress westward had been maintained by some of the Turkish tribes, a portion of whom appear (5th c. A.D.) in Southern Russia, and on the northern frontier of the Byzantine Empire, driving before them the kindred race of the Avars. They were found in Syria and Mesopotamia in the 7th c., and about the same time wandered into Northern and Eastern Khorassan. But the seat of power of the Turkish race still was in Central Asia, whence in the 10th c. the Seljuks (q. v.) emerged, conquering Persia, Syria, and Asia Minor, and establishing an empire which reached from Constantinople to the borders of Mongolia. The subdivision of the Seljuk empire in South-western Asia led to its gradual absorption by the Khaurezmians in the north, and the Kurds in the west, till the irresistible tide of Mongol invasion under Genghis Khan (q. v.), rolling over Central and Western Asia, and the east of Europe, completely overwhelmed Turkish dominancy. The great empire of Timur (q. v.) was Turk, with a strong infusion of the Mongol element, the residue of Genghis's irruption; and its destroyers, the Uzbeks (q. v.), and the various other tribes—Khirghis, Kiptchaks, Turkomans, &c.—which now possess its extensive domains, are also of Turkish race. The Osmanli-Turks are descended from a portion of the Turkish tribe of the Kayi, which fled from its settlements in Khorassan before the Mongols, and took refuge with the Seljuks of Iconium. See OTTOMAN EMPIRE, SELJUKS, &c.

The following is the enumeration of the principal Turkish tribes given by Dr. Latham: '1. *Uigurs*—On the Mongol frontier. Belonging to China. The Uigurs were the first Turks that used an alphabet. Little known. 2. *Turks of the Sandy Desert.*—Conterminous with Mongolia and Tibet. 3. *Turks of Khoten, Kashgar, and Yarkend.* 4. *Kirghis.*—Independent Tartary. The Kirghis (q. v.) form a portion of the population of the highest tableland in Asia—perhaps in the world—Pamir and the source of the Oxus. 5. *Uzbeks* (q. v.).—The Turks of Bokhara. 6. *Turkomans.*—The Persian frontier of Independent Tartary from Balkh to the Caspian. Pastoral robbers. 7. *Ottoman or Osmanli.*—The Turks of the Turkish Empire. 8. *Nogays.*—The Turks of the parts between the Black Sea and the Caspian, north of Caucasus. 9. *Turks of the Russian Empire.*—Bashkirs, Teptyars, Baraba, &c. With all these, although the language is Turk, there is good reason to believe that the original substratum is Finn. With the Bashkirs, this is generally considered to be the case. 10. *The isolated Yakuts of the Lena.*'

In physical appearance, all these tribes, with the exception of the Ottoman T. partake more or less of the Mongolian type. They have in general a broad, flat face, with prominent cheek-bones, the head from side to side nearly equal to its length from the forehead to the occiput, the nose flat, the eyes small, the color of the skin yellowish, straight hair, little or no beard, and stature undersized. It is among the nomad and agricultural T. that these characteristics are most prevalent, while among the more civilized they almost entirely disappear.

Dr. Prichard quotes Lieutenant Wood's account of the Kirghis as a good average description of the primitive Turkish tribes. 'In stature,' he says, 'the Kirghis are under the middle height; of a *kyl* numbering seven men, the tallest was 5 feet 5¼ inches in height. Their countenance is disagreeable; the upper part of the nose sinks into the face, leaving the space between their deeply-seated and elongated eyes without the usual dividing ridge; the brow immediately above the eye is protuberant, but starts back more abruptly than in Europeans; their cheeks, large and bloated, look as if pieces of flesh had been daubed upon them; a slender beard covers their chin, and in those individuals who have more luxuriant hair, the beard has a natural curl. Their persons are not muscular. Their complexions are darkened by exposure to all weathers rather than by the sun. The women are rather good-looking, and of delicate form, like the Hazaras, and make good wives.' The T. of the Turkish Empire, especially those of the upper classes, differ considerably from the type here described. The Ottoman T., in fact, both in feature, height, and general physical structure, bear a strong resemblance to other European nations. This is accounted for chiefly by the custom now prevalent among them for ages of intermarrying with Circassian females.

The various Turkish tribes speak very nearly the same language; 'so much so, that the Yakut of the Icy Sea is said to be intelligible to the Turks of Central Asia, and even of Constantinople.' In religion, the T. are for the most part Mohammedans; but the Yakuts are Shamanists; the T. bordering on the Chinese Empire are Buddhists; and those of Siberia, Christians of the Russo-Greek Church.

TU'RMERIC (*Curcúma longa;* see CURCUMA), a plant of the natural order *Scitamineæ*, a native of the East Indies, much cultivated both in India and in Cochin-China. The leaves are lanceolate, sheathing each other at the base, about a foot long; they spring from the crown of the root, and from their center rises a short leafy spike, with small cream-colored flowers. The root is divided into several fleshy fingers, oblong and as thick as a man's thumb, sometimes crooked when young, and the root then abounds in a kind of arrow-root; but in a more advanced stage, it contains in large quantity a peculiar, resinous, yellow substance, which is used as a dye-stuff, and for other purposes, and is called *Turmeric.* It appears in commerce in the form of dried roots, or as a powder. It depends for its value chiefly on a resinous principle called *Curcumin*, which is scarcely soluble in water, but easily soluble in alcohol and ether. The yellow color obtained from T. is not very durable, although it is employed as a dye both for silk and wool. Chemists make much use of T. as a test for alkalies, which change its yellow color to reddish brown, as do also their carbonates and phosphates, some of the alkaloids, and boracic acid. T. test-paper is made by immersing unsized paper in tincture of turmeric. It is much employed in the East in medicine, as a gentle laxative, diuretic, and stimulant. It is also much used as a condiment with many kinds of food, and is the principal ingredient in *Curry-powder.* For its cultivation, T. requires a rich friable soil, and a situation not liable to be flooded. It is propagated by cuttings of the root, which are planted at distances of eighteen inches or two feet. It is planted in April or May, and the crop is gathered in December. This kind of T. is sometimes distinguished by the name of LONG T.; and the name of ROUND T. is given to *Kæmpferia pandureta*, a plant of the same order, also a native of the East Indies, the roots of which are shorter and rounder, but otherwise of very similar quality. They are not nearly so much an article of commere as the other kind, but are particularly valued for the preparation of an artificial gold varnish, as they yield a better color than the long or true Turmeric. The Arabic name of T. is *Kurkum*, whence *Curcuma.*

TURN, in Music, an embellishment formed by the adjoining notes above and below combined with the principal note, and indicated by the sign ∽. Should another than the principal note follow the turn, the principal note is added before the next note is played, so as to give the turn four notes. In either of these cases, the turn must be played during the time of the principal note. But when the sign ∽ is placed above or below the principal note, the first note of the turn takes the place of the principal, which is played in combination with the others.

TU'RNAU (Boh. *Turnóv*), a walled town of Bohemia, circle of Jung-Bunzlau, on the east bank of the Iser, 50 miles north-east of Prague. It has a church, built in 1825, which is reckoned one of the most beautiful in Bohemia. T. has manufactures of cotton, woollens, and more particularly artificial gems, which are exported in great quantities to the United States. Pop. 4900. Here was fought (July 1866) a battle between the Prussians and Austrians, in which the former were victorious.

TURNER, JOSEPH MALLARD WILLIAM, the greatest of British landscape-painters, was born at 26 Maiden Lane, Covent Garden, London, in 1775. The precise day of his birth is unknown; but an approximation to it is furnished by his baptism, which is registered in the parish church as of date 14th May of

that year. He was the son of a barber, and received an exceedingly defective education. His turn for art showed itself very early, and drew attention to the boy. To a Dr. Monro, in particular, who gave him access to his excellent collection of water-color drawings, and otherwise kindly furtherance, he used afterwards to express his obligations. In 1789, he became a student at the Royal Academy, where, doubtless, he learned something; but throughout he seems to have been indebted less to any formal teaching than to the tentative efforts of his own singularly original genius. In 1787, when only twelve years old, he exhibited two drawings at the Royal Academy. Again, in 1790, he exhibited; and thence onwards till his death, with intermission of only one or two years, his pictures were regularly to be found on the walls. His success is sufficiently shown in the fact, that so early as 1799 he was elected an Associate of the Royal Academy, and only three years afterwards, attained the full dignity of Academician. The honor was worthily bestowed on one whose claim was already admitted as the first landscape-painter of his time; but his election in 1807 to the post of Professor of Perspective could scarcely be considered so judicious. A man so abnormally illiterate that his simplest note included a crop of solecisms, was not likely to succeed as a lecturer; and as a lecturer he failed utterly. The knowledge which he abundantly possessed, he could not in the least communicate; and after a very few years, he ceased to make the attempt. In the exercise of his art, T. traveled much; he was frequently in Scotland, France, Switzerland, and the Rhine countries; and in 1819, 1829, and 1840, he paid visits to Italy. His industry was almost as unexampled as his genius.

To the exhibitions of the Royal Academy, he contributed in all 259 pictures; but among these, many of his finest works were not included; and in another branch of art, the amount of his achievement was extraordinary. In 1808, he commenced the publication of his famous *Liber Studiorum*, a serious of engravings from original designs, which ranks as one of his most important undertakings; to this is to be added his *Scenery of the Southern Coast, England and Wales. Rivers of England. Rivers of France*, &c.; and besides, his services were continually in request as an illustrator. The illustrated edition of Rogers's *Poems* is his most celebrated work in this kind, and is quite unique in magnificence. At his death, which took place 19th December 1851, at Chelsea, where his few last years were passed in a small house by the river-side, it was found that he had bequeathed to the nation the noble collection of his works, which now occupies a room in the National Gallery, and remains a permanent monument of the power and splendor of his genius, if also of its occasional eccentricity and extravagance. The large fortune, amounting to something like £200,000, which he had amassed by his industry and thrift combined, he left to found an asylum for decayed artists; but owing to some technical defect in his will, this purpose could not be carried out.

Of the genius of T., and the various phases through which it was developed till it sunk in the decay and deliration obvious in the work of his few last years, we cannot here attempt to treat. In the eloquent pages of Mr. Ruskin's *Modern Painters*, the subject will be found thoroughly discussed. There are lives of Turner by Walter Thornbury (1861) and by P. G. Hamerton (1879). The picture presented, especially by the former, is a somewhat dark and painful one. This creator of the beautiful on canvas was in his character and way of life by no means so surprising a revelation of it. He was coarse, sensual, sordid, avaricious: of his inordinate passion for money, many odd anecdotes are extant; but it is only fair to say, that by the few friends who knew him intimately, he was held to be essentially a man of kindly and generous nature. He lies buried in the crypt of St. Paul's, beside Sir Joshua Reynolds.

TURNER, SHARON, the Anglo-Saxon historian, was born in London, September 24, 1768, articled to an attorney at the age of fifteen, and succeeded his master in the business before the period of his clerkship had expired. He continued, however, to gratify his literary tastes; and after years of hard reading and patient collection of materials, published, 1799—1805, a *History of the Anglo-Saxons*, in 3 vols., a work, with all its imperfections, that has given its author a permanent place in English literature. Other writings of T.'s are: *The History of England from the Norman Conquest to* 1509 (1814.); *History of Henry VIII.* (1826); and *Reigns of Edward VI., Mary, and Elizabeth* (1829); all of which were subsequently republished together under the title of *History of England from the Earliest Period to the Death of Elizabeth*; *Sacred History of the World as Displayed in the Creation and Subsequent Events to the Deluge* (1832, *et seq.*); a volume of essays and poems, &c. T. died February 13, 1847.

TURNHOU'T, a well-built town of Belgium, province of Antwerp, 34 miles east-north-east of the city of Antwerp, in the district known as the Campine (see BELGIUM), and the terminus of a branch-line of the Brussels and Antwerp Railway. The inhabitants manufacture ticking, and linen and lace goods, cutlery, playing-cards, paper, oil, &c. Pop. (1876) 15,743. T. is historically noteworthy as the scene of two battles, the first won 22d January 1597, by the Netherlanders, under Maurice, Prince of Orange, over the Spaniards; and the second, 27th October 1789, by the patriots under Van der Mersch, over the Austrians.

TURNING, the art of shaping wood, metal, ivory, or other hard substances into forms having a curved (generally circular or oval) transverse section; and also of engraving figures composed of curved lines upon a smooth surface, by means of a machine called a *turning-lathe*. This art is of great importance and extensive application in mechanics, the most delicate articles of luxury and ornament, equally with the most ponderous machinery, being produced by it. The art of turning dates from a very early period, and Theodorus of Samos (about 560 B.C.) is named by Pliny as its inventor; but long before this period, the *potter's wheel* (see POTTERY), the earliest and simplest form of turning-machine, was in general use, as is evidenced by numerous references in Holy Writ. The immense variety of work performed by turning-machines necessitates great variations in their construction; but their mode of operation is always the same, and consists in fixing the work in position by two pivots or otherwise, causing it to revolve freely round an axis of revolution, of which the two pivots are the poles, and holding a chisel or other cutting-tool so as to meet it during its revolution, taking care that the cutting-tool be held firmly and steadily, and moved about to different parts of the work till the required shape be obtained. Lathes are divided, with respect to the mode of setting them in motion, into *pole*-lathes, *foot*-lathes, *hand-wheel* lathes, and *power*-lathes; with respect to the species of work they have to perform, into *center*-lathes, which form the outside surface, and *spindle, mandrel*, or *chuck* lathes, which perform hollow or inside work, though this distinction is for the most part useless, as all lathes of good construction are now fitted for both kinds of work. *Bed*-lathes are those used by turners in wood, and *bar*-lathes for the best sort of metal-work; and the small metal center-lathe employed by watch-makers is known as a *turn-bench*.

The primitive and most simple form of lathe for wood-cutting is the pole-lathe. It consists of two planks or beams placed horizontally side by side with a narrow space between them, which, being firmly supported at a convenient height, constitute the *bed;* of two uprights or *puppets* rising from the bed, one of them stationary at the left end, and the other sliding along over the slit between the beams, and capable of being fastened at any required point by a projecting tenon and wedge beneath; of a *treadle* below and parallel to the bed; and of an elastic *pole* or *lath* (whence some derive the name lathe) fixed to the ceiling above. This form of lathe is well adapted for turning long thin cylinders of wood, the piece to be turned being held fast at each end by the conical iron or steel point projecting from the inner face of each puppet. Motion is communicated to the work by a cord which is fastened to the lath overhead, wound twice or thrice round the work, and then attached to the treadle below. When the workman presses his foot on the treadle, the work commences to revolve rapidly, unwinding the cord towards the treadle, and winding it up on the side next the pole, causing the latter to bend considerably. During this period, the workman has been holding his cutting-instrument to the work; but after the treadle has been quite pressed down, he removes his foot, and the reaction of the bent pole causes the work to revolve in an opposite direction, till the pole has straightened itself; and during this latter revolution no cutting is done. When the whole piece is to be turned, the cord must be moved from an unfinished to a finished part of the work. For the pole, an elastic steel bow and string are substituted when the work is light or fine, the cord being attached to the middle of the string, and the bow fastened to the ceiling by its center.

The advantage of the pole-lathe is, that it never acquires an impetus in the direction of the cutting motion, for whenever the pressure on the treadle is removed, the reaction of the pole takes effect; but the great waste of time during the straightening of the pole and rising of the treadle, has caused the abandonment of this machine for the foot-lathe. The foot-lathe, the most common and generally useful form of lathe, differs from the former in having a *head-stock* or *fast-head* in place of the left-hand stationary puppet. This head-stock, H, H (fig. 1), consists of two supports or puppets firmly connected at their base, and fastened at right angles to the bed by means of the screws, A, A; the outer puppet is pierced for the screw, S; and the inner is supplied with a steel collar, within which the mandrel, M, which carries the speed-pulleys, P, turns. The left end of the mandrel is concave, so as to allow the steel point of the screw, S, to fit closely. R is a *rest*, which slides along the slit between the two beams of the bed, and may be clamped at any point, and elevated or depressed as is found necessary. The rest is used by the workman for leaning his cutting tool upon, in order to afford it greater steadiness. G is the right-hand puppet *front-head*, or *tail-stock*, movable along the slit in the bed, and capable of being fastened like the rest; its point, I, can be advanced or re-

tired as required by means of the screw, J. C is the spindle, which, being connected with the treadle, W, by means of the rods

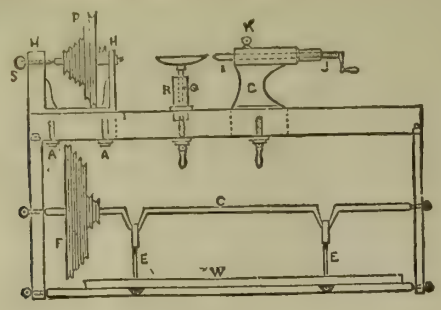

Fig. 1.

or chains, E, E, turns the fly or foot wheel, F, and by means of an endless band connecting the latter with the speed-pulleys, communicates motion to the mandrel.

The pulleys on the spindle and mandrel are of different sizes, and so arranged, that when the endless band is placed on the left-hand pulleys, an extremely rapid motion is communicated to the mandrel, the motion being reduced more and more as the band is transferred more to the right, till, at the extreme right, the rotatory motion is much slower than that of the spindle. When the foot-lathe is required for center-work, the inner end of the mandrel is furnished with a point similar to I; but when hollow or inside work is to be done, it must be armed with a screw, as in the figure. In this latter case, certain contrivances, known as *chucks*, for holding the work, are screwed on to the end of the mandrel. Some of these most commonly used are the *screw-chuck*, which shows on its right side a flat circular surface, from the center of which projects a large, coarse, conical screw for holding firmly any large piece of wooden work; the *hollow chuck*, a strong circular cup with perpendicular sides, into which one end of the work is firmly fastened by a mallet, or, if too small, by four screws working inwards through its sides; the *drill-chuck*, of a cylindrical form similar to the last, but with a square cavity for holding drills, the instrument, and not the work, being made to rotate in this instance; and the *concentric chuck*, a most ingenious piece of mechanism—a flat plate with two slits almost to the center, and in line of a diameter, within which slits works a spindle, with screw-ends carrying two steel studs, whose heads project through the slits above the surface on the right side; these heads carry two curved pieces, which serve as clamps to hold the work; and as the spindle-screws are of the same fineness, and with right and left threads, the revolution of the spindle either removes both further from the center, or brings both nearer to it; hence, when the studs are once set at equal distances from the center, they always remain so, and the work may be removed and replaced without danger of destroying the adjustment. All these chucks are of metal, and are mostly employed for heavy work; turners of wood or ivory preferring wood-chucks, which can be altered as required, and secured by an iron ring round the outside to prevent splitting.

The cutting-tools employed are very various: gouges are used to rough out the work—if soft-wood—after which chisels with a straight oblique edge are employed: the instruments for harder materials, such as ivory or bone, are smaller than the former, and have their sharp edges 'better backed;' for inside work, drills are first employed to make an opening, and then cutting-

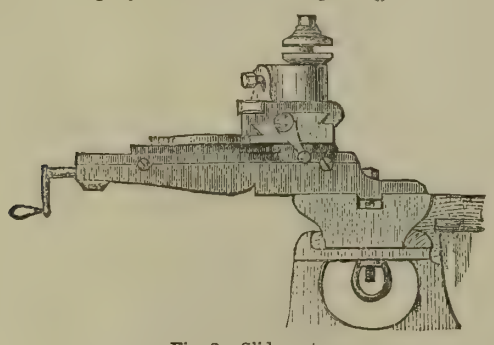

Fig. 2.—Slide-rest.

tools of various shapes are employed, according to the form which is wished to be given to the interior surface. To avoid the imperfections in the workmanship arising from unsteadiness of hand in the workman, the *slide-rest* (fig. 2) is employed. This valuable addition is furnished with two motions, one towards the work, and the other along, parallel, or at any inclination to it, according as cylindrical or conical figures are required; there is a socket for the chisel, which is firmly held in its place by a screw; and after the slide-rest has been adjusted, the operator has only to move the rest forwards or sideways, as may be required, the motions being effected by two screws and winches.

The *hand-wheel* lathe is similar to the former, but so much larger as to require two workmen, one of whom is employed in setting the instrument in motion by turning a wheel, which corresponds to the wheel F in fig. 1. The *power*-lathe is similarly set in motion by horse, water, or steam power, and is employed for heavy metal-work, as piston-rods, iron columns of various kinds, wheels, artillery, &c. This machine differs from the foot-lathe chiefly in the substitution of rack-work, and wheels and pinions, for the endless band, and for manual labor, in the various adjustments of the machine, such as in moving forward the tail-stock, &c.; and in the mandrel being supported by both puppets of the head-stock. In wood-turning, the wood is first prepared by a hatchet and rasp, must be lightly though firmly pressed against by the cutting tool; while metal-work must be cleaned from the sand of the mould or scales of the forge, and in turning, requires less care. Soft woods must be made to revolve with great rapidity; very hard woods and brass require much less velocity; wrought iron and copper, still less; steel, a further diminution of speed; and cast iron, the least velocity of all. After the work has been duly shaped, it requires to be polished; and this is effected while it is still in the lathe and rotating, by applying shark's skin to wood, pumice-stone and chalk to ivory and horn, and emery, tripoli, or putty powder to metals.

Hitherto, we have supposed that the axis of revolution of the work is fixed, and consequently that all work has been turned so as to present a transverse circular section; but many other forms of section may be easily obtained. The general mode of obtaining these non-circular figures is by screwing on to the mandrel an apparatus, by means of which the work can be thrown out of the center of rotation at regular intervals; but as each different class of form requires a separate kind of apparatus, it is impossible here to describe the operations in detail. One species, however, known as *rose-engine turning*, and employed for producing involved curvilineal figures, such as appear on bank-notes and on ornamented gold, silver, or gilt work, is so peculiar and ingenious, as to call for more special notice. In this species, the standards which support the mandrel are no longer fixed at right angles to the bed, but are capable of oscillating backwards or forwards in a plane parallel to the plane of rotation of the mandrel, and are so acted on by a spring, that when pushed to one side they are at once restored to their former position on the pressure being withdrawn. Suppose, then, a metal wheel with its rim waved or indented, fastened concentrically on the mandrel, and the mandrel, pushed aside by a fixed steel point or roller, applied to the rim of the wheel; the reaction of the spring against the pressure of the roller will keep the latter in close contact with the waved rim throughout, and will produce a definite oscillatory movement of the mandrel, of the chuck, and the work fastened on it, and consequently—the cutting or graving tool being firmly held by the slide-rest—definite deviations from a circle in the lines marked on the face of the work. The wave-rimmed wheel, called a *rosette*, may be replaced by another, and that by a third, and so on till a sufficient number of different waved lines are obtained. A number of rosettes are generally strung at once on the mandrel, and the fixed guide is brought into gearing by means of a steel band called a rubber, with one rosette after another. Similar concentric curves of greater or less perimeter are obtained by removing the slide-rest from, or bringing it nearer to, the axis of revolution.—For more complete information respecting this most interesting machine, and its many varieties of form and application, see article 'Turning' in the *English Cyclopædia*, Holtzapffel's *Turning and Mechanical Manipulations* (Lond. 1847—1852), and *Tourneur* (*Manuels-Roret*), by Valicourt (Paris, 1858).

TURNIP (*Brassica rapa*; see BRASSICA), a biennial plant, with lyrate hispid leaves; the upper part of the root becoming, especially in cultivation, swollen and fleshy. It is a native of Europe and the temperate parts of Asia, growing in borders of fields and waste places. It is commonly regarded as a native of Britain, although in most cases of its being found apparently wild, it may be doubted if it has not derived its origin from cultivated varieties. It has been long cultivated, and is to be found in every garden of the temperate and cold parts of the world as a culinary esculent; it is also extensively grown in fields for feeding cattle and sheep. It was cultivated in India long before it could have been introduced by Europeans, and is common there in gardens and about villages. The cultivated varieties are very numerous. In them, the upper part of the root assumes a globose, oblong, or roundish depressed form. Some are common to the garden and the farm, and some of the largest kinds attain such a size as to

weigh 20 or 25 lbs. Although the T. is of great value for feeding cattle, and the introduction of it into general field-culture was one of the greatest improvements ever effected in the husbandry of Britain, it is not very nutritious, no less than 90—96 parts of its weight actually consisting of water. Garden turnips are sown from the end of March to the end of August; field turnips generally in June, it being requisite that they should not be sown so soon as to incur a risk of their throwing up flower-stems in the first year, which, when it takes place, prevents in a great measure the swelling of the root, and renders it coarse and fibrous. In the garden cultivation of turnips, the root is generally intended for use in the first year. In dry weather, the plants are apt to throw up flower-stems, and so disappoint the hope of the gardener; which is also the case if the seed is sown too early in spring. Moist cloudy weather is most favorable. Garden turnips are sown, and allowed to grow, much closer than field-turnips; being gradually thinned out, and the thinnings used even when of small size. The varieties both of garden and field turnips are very numerous. The garden turnips are generally of comparatively small size, more rapid in growth and more delicate.—The SWEDISH T. or RUTA BAGA, which was introduced into cultivation in Britain, from the north of Europe, more recently than the common T., and has proved of very great value to the farmer, is regarded by some botanists as a variety of the same species, and by some as a variety of *Brassica napus*, but more generally as a variety of *B. campestris*, a species common in corn-fields and sides of ditches in Britain and the north of Europe.

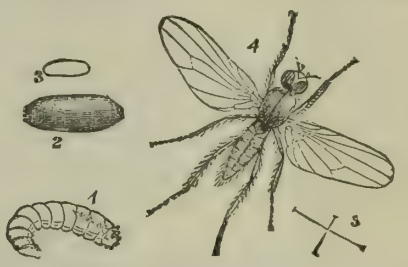
The cultivated T. grows best in a rich free soil. The mode of culture varies with the soil. Where the soil is light and dry, a smaller amount of plowing, harrowing, and drilling is necessary than on stiff soils. The T. is not well suited to clay soils, although it is often grown on them. A complete pulverization of the soil is requisite before the sowing of the seed. On light soils, a crop of turnips generally succeeds wheat or oats. T.-land is generally made up in raised drills, by the plow, and the seed is sown by the drilling-machine, on the top of the narrow ridges, which are about 27 inches apart. Small doses of guano, superphosphate of lime, crushed bones, or other such manures, produce great crops of turnips. They seem to act chiefly whilst the plant is young; and when it is further advanced, it derives nutriment from the soil, and even from the subsoil, by deeply penetrating roots, and from the atmosphere by its large leaves. See BONES AS MANURE. The young plants are thinned out by the hand-hoe, to a foot or upwards apart, and the ground is stirred and carefully kept clean by the plow or horse-hoe. The T.-crop is thus of great use in clearing the land of weeds. In many places, part of the crop is eaten on the ground by sheep, which are confined to a small part of the field by means of movable fences. It is common to leave one of each three rows of turnips for this purpose, the other two rows being carried to the farmyard for feeding cattle or stored. Turnips are stored either in a house, or in conical heaps, covered with their own leaves, or with straw and earth. They are sometimes protected from frost by being earthed up in rows by the plow. Some kinds are much more easily injured by frost than others; the Swedish turnips least of all.

The introduction of the T. as a field-crop is one of the most important events in the history of British agriculture. It has rendered possible a rotation of crops, which has been extremely advantageous, and has made the supply of butcher-meat more constant, by providing a supply of winter-food for cattle and sheep, whereas, formerly, all depended on the pasture. T.-husbandry was introduced into Scotland from Norfolk in the latter part of the 18th c., but soon attained a development, and was carried to a perfection in Scotland far beyond what it had previously reached anywhere. The climate of Scotland is particularly adapted to it, as is also that of Ireland; moist weather, both in summer and autumn, being suitable to the T.; whilst the climate of North America is so unfavorable to it, that it has not become an important crop there. Of late years, T.-crops in Britain have suffered very much from the disease called Anbury (q. v.), or *Fingers and Toes*. This is not the case in Norfolk, and the exemption is supposed to be due to the use of clay-marl as a manure; but the whole subject is involved in obscurity. The T. not unfrequently suffers from a fungus of the genus *Botrytis* (*B. parasitica*), allied to that which is supposed to cause the potato disease. It infests plants of rank growth, attacking their roots, which are weakened by the too great luxuriance of the leaves. Plants weakened by drought are liable to suffer from a white mould, a species of *Oidium*, which attacks the leaves, and renders the plant worthless. The leaves are devoured by the T.-fly, T.-flea, or T.-beetle (*Haltica nemorum*), and by other species of the same genus. The Nigger Caterpillar, the larva of *Athalia spinarum*, also devours the leaves, as well as the caterpillars of White Butterflies (*Pontia brassicæ*, *rapæ*, and *napi*), and of some moths. The leaves are also mined by the larvæ of several dipterous flies. Several species of aphis suck the juices of the leaves, and one (*A. floris rapæ*) devotes its attention to the young crops in seed-leaf, which are also attacked by a rose-chafer (*Cetonia aurita*), and a minute beetle (*Meligethes æneus*). Slugs, snails, and wire-worms are among the enemies of the turnip.

The young leaves of the T., are good as greens, and particularly those of the Swedish T., when it has begun to sprout in spring.

TURNIP-CUTTER, an implement used for cutting turnips for cattle. It is useful, not only as saving the teeth of sheep, which are apt to be much injured by eating turnips, but as preventing waste, for sheep feeding upon turnips scoop out a part, and leave the rest to rot. The oldest and simplest turnip-cutter acts by mere pressure, and is like a large nut-cracker on a stand. Many kinds are now in use, of which perhaps the best are those having knife-edges on the surface of a cylinder or cone, which are brought to act on the turnips by turning a handle.

TURNIP-FLY, a name given to several insects destructive to turnips. It is often given to *Altica* (or *Haltica*) *nemorum*, also called TURNIP-FLEA, from its skipping or leaping powers, but which is truly a very small beetle, with long and strong hind-legs,



Turnip-fly (*Anthomyia radicum*):
1, Maggot (magnified); 2, Pupa; 3, natural size: 4, insect; 5, natural size.

and ample wings, of a shining black color, with two yellowish stripes down the wing-cases, and ochreous legs. It swarms in meadows and hedge-rows in most parts of Britain from March to October, the larva feeding on many cruciferous plants. It often commits great ravages in turnips-fields, whilst the turnips are very young. The female lays her eggs on the under-side of the leaf, and the minute larva mines in the leaf, under the skin, making a tortuous gallery. Farmers sometimes steep the seed of turnips in order to prevent the ravages of this insect, but no good can be thus done, as the eggs are not in the seed.

The TURNIP-FLY, more properly so called, is *Anthomyia radicum*, a dipterous insect of the family *Muscidæ*, and of the same genus with the Cabbage-fly and Beet-fly. It attacks the root of the turnip, as the Cabbage-fly does that of the cabbage, the larva living in the root.

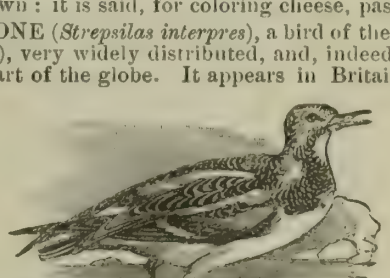
TURNIP SAW-FLY. See SAW-FLY.

TU'RNPIKE ROADS. See HIGHWAY, TOLL.

TURNPIKE STAIR, a turret stair revolving round a central newel.

TU'RNSOLE, a peculiar coloring material consisting of very coarse linen rags, usually pieces of sacking, prepared by cleaning and bleaching, and then dipped into the juice of the leguminous plant called *Crozophora tinctoria*, previously mixed with ammoniacal matter, and exposed to the air for some time. It is made in France, but is exclusively used in Holland, but for what is not certainly known: it is said, for coloring cheese, pastry, &c.

TU'RNSTONE (*Strepsilas interpres*), a bird of the plover family (*Charadriadæ*), very widely distributed, and, indeed, found in almost every part of the globe. It appears in Britain, chiefly as a



Turnstone (*Strepsilas interpres*), in summer plumage.

winter bird of passage, but breeds occasionally in the Shetlands. It frequents the sea-shore, and derives its English name from its habit of turning over small stones with its bill in search of food. It is the only known species of its genus. The eggs, which are four in number, are laid on lonely rocky coasts where there is sparse vegetation. They vary very much in color and markings, and are cunningly concealed. The whole length of the T. is rather more than eight inches. The plumage varies with the age

of the bird and the season. In August the plumage begins to get dull.

TU'RPENTINE is a semi-solid resin which is yielded by various species of pine, and by some other trees when incisions are made into them. The chief varieties of turpentine are *Common Turpentine*, yielded by *Pinus abies; Venice Turpentine*, yielded by the larch; *Bordeaux Turpentine*, yielded by *Pinus maritima;* and *Chian Turpentine*, yielded by *Pistacia lentiscus.* The Venice turpentine, which is regarded as the best variety, occurs as a clear, transparent, pale yellow, viscous mass, of a balsamic odor, and an acrid bitter taste, perfectly soluble in spirits of wine, and increasing in density on prolonged exposure to the air. On distilling it with water, it yields a considerable quantity of essential oil, vulgarly known as *spirits of turpentine.* This *oil of turpentine* (which, from its greater cheapness, is usually obtained from common turpentine) is, after rectification, represented by the formula $C_{20}H_{16}$, and has a spec. grav. of 0·864, and a boiling-point of 320°. It is colorless, transparent, has a strong refractive power, a strong peculiar odor, and a disagreeable acrid taste. It is readily soluble in alcohol, in ether, and in the fixed and essential oils, but is insoluble in water, on which it floats. It is a good solvent for many substances, amongst which may be especially mentioned sulphur, phosphorous, caoutchouc, and the various resins; and is largely used in many departments of the arts, forming a large proportion of all oil paints. Great quantities are imported into Britain from the United States, where it is mostly yielded by the Swamp-pine.

Turpentine is an energetic producer of Ozone (q. v.); and on keeping it for a long time in a stoppered flask, which should be occasionally shaken, the odor of ozone is very distinct on opening the vessel. Oil of turpentine forms three hydrates, of which two are solid. Commercial oil of turpentine often consists of a mixture of several isomeric hydro-carbons which act oppositely on polarized light (like the several varieties of sugar). Deville and Berthelot have ascertained that there are various modifications of which this oil is susceptible without its undergoing any change in its chemical composition. Of these, *isoterebenthene* and *metaterebenthene* differ *inter alia* in their boiling-points, and may thus be separated; *terebene* (which has an odor resembling that of oil of cloves) and *colophene* are obtained by acting on the oil with sulphuric acid; and *camphilene* and *terebilene* by decomposing artificial camphor (which is a combination of the oil with hydrochloric acid) by means of quicklime.

Under the influence of nitric, hydrochloric, and sulphuric acids, chlorine, &c., oil of turpentine yields many products of interest to the chemist, but as yet of little practical value.

Oil of turpentine is used to a considerable extent in medicine, although, from its disagreeable taste, and from certain bad effects which occasionally follow its use (as strangury, bloody urine, vertigo, a species of intoxication, and an eruption on the skin), it is often supplanted by less certain remedies. It is probably the most effective remedy for the expulsion of tapeworm, is nearly equally efficacious over the lumbrici or round-worms, and in the form of an injection is serviceable in the case of ascarides or thread-worms. For an adult, in a case of tapeworm or round-worm, the dose should be one ounce, combined with an equal quantity of castor-oil, or made into an emulsion with yolk of egg or mucilage. In the case of children and delicate women, it is better to try a milder vermicide (see VERMIFUGES). In doses of from two drachms to two ounces, and in similar combination with castor-oil, it may be given as a cathartic in cases of obstinate constipation, especially when dependent on affections of the brain; in hysteria, epilepsy, tympanitis, passive hæmorrhage, and in purpura hæmorrhagica, in which last-named disease Dr. Neligan highly recommends it. In small doses (as from 10 to 20 minims), oil of turpentine is regarded as a diuretic; but it must be given with caution, in consequence of its stimulating properties. It is of more service in chronic mucous discharges of the genito-urinary organs, as gleet, leucorrhœa, &c., than in dropsy. In small doses it is often useful in chronic rheumatism and in sciatica.

In the Dublin school, it is much employed in small and repeated doses as a general stimulant in the low stages of continued fever. *Turpentine Punch* has long been a favorite remedy in the Meath Hospital (where Graves and Stokes made their reputation) in these cases. It is composed of an ounce of oil of turpentine, two ounces of brandy, eight ounces of boiling water, and a sufficient quantity of sugar. A third of this should be taken for a dose, and should be repeated if necessary every third hour. When applied externally, oil of turpentine is a speedy and powerful rubefacient and counter-irritant, and is beneficially used in this capacity in inflammatory attacks of the throat, chest, and abdomen. The best method to pursue is to rub the oil by means of a bit of flannel over the part to be acted on; over this to lay three or four folds of flannel, wrung out of hot water, and over the flannel to place a dry towel; two or three such applications produce a sufficient result. There is a *Liniment of Turpentine* which is powerfully stimulating, and is applied as a dressing for extensive burns; and is likewise used, with friction, in rheumatic and neuralgic cases. There is also the *Liniment of Turpentine and Acetic Acid*, which is the officinal representative of the well-known *St. John Long's* liniment, and is an excellent counter-irritant (applied with a sponge) in pulmonary consumption and other chronic pulmonary affections. Lastly, *Ointment of Turpentine*, a warm stimulating application, requires mention.

It was mentioned at the beginning of this article that on distilling turpentine with water, the oil comes over. The residue left in the retort constitutes common *resin* (or *rosin*), known also as *colophony.* See RESINS.

TURPENTINE TREE. See PISTACIA.

TURPIN, Archbishop of Rheims, friend and companion of Charlemagne, and eye-witness of the exploits he relates—such are the names and qualifications assumed by the author of a chronicle in Latin prose narrating the expedition of the Frankish emperor against the Saracens of Spain, and particularly the events that preceded and followed the battle of Roncesvalles (q. v.). That a Bishop Turpin existed about this period, is admitted, but the very documents in which he is mentioned, state that he was slain at Roncesvalles. There was also an Archbishop Turpin of Rheims (753—800 A.D.), but he has no claim to the description given above; and, in fact, all internal evidence leads to the conclusion that it is a work of the 11th century. It seems to have sprung out of the epic ballads and traditions of the Carlovingian heroes, while these were still in a comparatively pure condition; but through the legendary manner in which they are told, there is visible a monkish aim—viz., to encourage the foundation of churches and monasteries, the undertaking of religious wars against the Saracens, and above all, the pilgrimage to San Jago de Compostella. Now, as in the year 1190, a brother of the Archbishop of Vienne (subsequently Pope Calixtus II.) obtained by marriage the countship of Galicia; as it was from Vienne that the pseudo-Turpin's chronicle was recommended to the rest of Christendom; as the same archbishop was detected on several other occasions fabricating false documents; as subsequently, in his quality of pope, he himself pronounced the chronicle authentic in a bull of 1122 (the authenticity of which has, however, been questioned); as he pursued the same family policy in his acts as pope, and in his sermons in honor of San Jago; finally, as the chronicle of the pseudo-Turpin is very often followed in the MSS. by a dissertation of Calixtus upon the miracles of San Jago, it has seemed to critics highly probable either that Pope Calixtus wrote the work himself, while yet Archbishop of Rheims (*circa* 1090), or, at least, that he took an important part in its composition. The book soon acquired a great popularity, was translated into French after 1206, and was made use of by divers chroniclers, as the author or authors of the *Chroniques de Saint-Denis*, Vincentius Bellovacensis, &c.

The chronicle is of great historic value, in spite of all the embellishments it has from time to time received; for, as one of the most ancient traditions of the time of Charlemagne, it has preserved numerous traits and details with more purity and fidelity than the poems of the Carlovingian cycle, which are generally of later date. The chronicle has been printed in Reuberus's edition of the *Scriptores* (Hanau, 1619; Frank. 1726), but see Ciampi's *De Vita Caroli Magni et Rolandi Historia Turpino vulgo tributa* (1822), and G. Paris's *De Pseudo-Turpino* (Par. 1865).

TU'RPIS CAU'SA, a phrase in the Law of Scotland, borrowed from the Roman law, to express an immoral consideration on which some contract or obligation is founded. The rule is, that when an immoral contract is broken, no court of law will assist either party to enforce it. Thus, if a man were to let lodgings to a prostitute, with the knowledge that the lodgings were to be used for carrying on her vocation, he would have no right to bring an action to recover rent.—The same is the rule in English law.

TURQUOI'SE, a mineral hitherto found only in the province of Khorassan, in Persia, and much prized as an ornamental stone. It is essentially a phosphate of alumina, containing also a little oxide of iron and oxide of copper. It is harder than felspar, but softer than quartz, and has a greenish-blue color. It is opaque, or sometimes translucent at the edges. It is sometimes called Oriental T.; whilst the name Occidental T. is given to a substance of similar color, found near Simon, in Languedoc, which is said to be merely bone colored with phosphate of iron.

TURRET-SHIP, a recent invention in naval warfare, consists of an iron-plated vessel rising but slightly above the water. In the middle of the deck are one or more turrets encased in the most massive plates, and holding each one or two guns of heavy calibre. The turret, in American vessels, is pivoted on the keel or other firm base; in English specimens it revolves on rollers under the periphery. By means of simple mechanism, it can be made, either by a steam-engine or by hand, to revolve with considerable speed, thus giving the gun a range in every direction. Turret-

ships were first proposed in America, by Mr. Theodore R. Timby, of New York, and were patented in this country by Captain Cowper Phipps Coles of the royal navy, who, after much discussion with the Admiralty, was allowed to adapt the *Royal Sovereign*, a wooden vessel which had been built for a three-decker, to his designs. The plan was tried under disadvantages, as the ship had not originally been destined for such heavy work. Notwithstanding, the *Royal Sovereign*, as a turret-ship, was declared

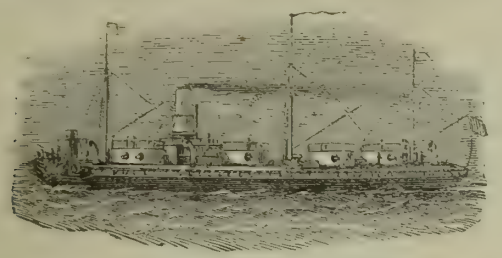


Fig. 1.—Turret-ship, *Royal Sovereign*.

by competent officers to be at that time the most powerful vessel in the British navy. Almost simultaneously in the United States, similar vessels, called 'Monitors,' sprang into existence, the principal point of difference between them and the British build being that their hulls are almost entirely submerged, the turrets being wholly above the upper deck; while, in the latter, the hulls rise higher from the water, and the turrets are sunk below the deck, except in so far as is absolutely necessary for discharging the ordnance.

The British model gives the advantage of higher free-board, and consequent greater safety in heavy seas. Captain Coles lost his

Fig. 2.—American Turret-ship, *Miantonomah*

life in the greatest naval catastrophe of modern times, the capsizing of his great turret-ship, the *Captain*, with about 600 souls on board, in the Bay of Biscay, in September 1870. This vessel was built after his complete design; but naval architects attribute her loss to a low free-board, coupled with heavy masting. It has for several years been in dispute whether to trust to turret-vessels or to ships with their battery in broadside. Under the administrations of Lords Palmerston and Russell, the Admiralty built broad-side vessels. Lord Derby's government signalized their accession to power in 1866 by immediately ordering four iron turret-ships of immense power and 4000 tons each.

Among the advantages claimed for turret-ships are—that much heavier ordnance can be carried centrically than at broadside, with equal dislocating pressure on the keel; that in a sea the platform

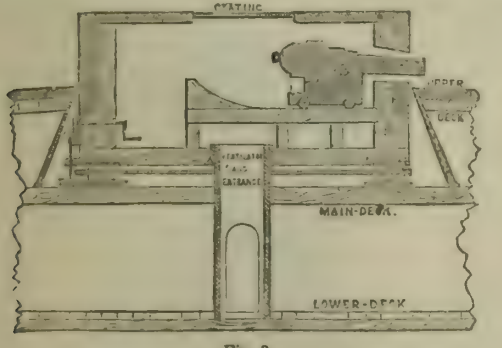

Fig. 3.

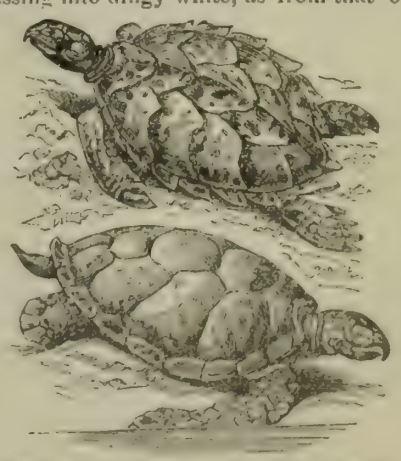
from which aim is to be taken is steadier at the center; that the mark offered to the enemy is smaller; and that the gunners are safer, as the turret can be turned with its port-hole away from the enemy during loading. The *Devastation*, with her 35-ton guns, has been exceeded in power by the *Inflexible*, whose armor-plating, amidships, is two feet thick, and which is furnished with two turrets, each containing two 81-ton guns. Mr. Rendel, upon whose principle the guns are mounted, uses hydraulic power, which enables the loading and firing to be conducted by two men only.

TURRITE'LLIDÆ, a family of gasteropodous molluscs, having a much elongated spiral shell, the lower spires remarkably separated. The name Turret-shell is often given to them.

TURTLE, the popular name of those Chelonian reptiles, the family *Cheloniadæ* of some, which have a rather flat carapace, and fin-like paddles instead of legs, suited for swimming, and not for walking. The fore-limbs are much longer than the hind-limbs. The toes are not all furnished with nails; in some species, there is only one on each foot, in others there are two. Turtles are all marine, and although they lay their eggs on the beach, seldom visit the shore for any other purpose. They deposit their eggs in holes, which they scoop in the sand with their hind-feet. The eggs are numerous, one hundred and fifty or two hundred being often deposited at a time, and the T. lays several times a year. The young, soon after being hatched, make their way through the sand which covers them, and immediately betake themselves to the water. The eggs are hatched by the heat of the sand alone, and the young receive no attention from their parents. Turtles crawl slowly and awkwardly on the shore; but their movements in water are comparatively quick, and even graceful. Some of the species feed entirely on grass-wrack and seaweeds, which their powerful, hard, and sharp-edged jaws cut with great ease: others prey on crustaceans, molluscs, and fishes. Their jaws are powerful enough to crush very large shells, and the carnivorous turtles are in general more rapid in their movements than the others. The flesh of those which subsist on animal food is musky and unpleasant; but that of the species whose food is vegetable is much esteemed.

In many tropical countries, turtles, after being captured, are kept in enclosures to which the tide has access to be killed when they are wanted. They are capable of subsisting long without food, and are imported alive from the West Indies into Britain, to supply the tables of the wealthy. In tropical countries, turtles are often very cheap. Their eggs are a much-esteemed article of food in the countries where they are found, and are sought for by probing the sand with a light stiff cane in the places known to be frequented by turtles. Turtles are easily taken when they come ashore for the purpose of laying their eggs, and one after another may be turned on its back—in which position it is helpless, and cannot make its escape—till a sufficient number is secured. They are also, however, taken in the sea, being cautiously approached by boats when resting, or apparently sleeping, at the surface, or by divers when descried at the bottom in their feeding-grounds. A small harpoon is used, or a rope is thrown over the head of the turtle. Turtles are sometimes pursued by boats in shallow parts of the sea until they are exhausted, the clearness of the water permitting them to be seen even when they dive; and when the boat gets near enough, a man leaps overboard, and seizes the T., clinging with both hands to the shell. It is said that at Mozambique a species of sucking-fish (*Echineis*) is used for catching turtles, a cord being attached to the fish, which is allowed to swim away in the sea, and is sure to fasten itself firmly to the first T. it meets.

The most esteemed T. of the West Indies is the GREEN T. (*Chelonia mydas*), which is the only kind imported into Britain for aldermanic and other feasts. The Green T. attains a large size, being sometimes six or seven feet in length, and weighing 700 or 800 lbs. The plates of its carapace do not overlap one another; the central ones are almost regular hexagons. The popular name is derived not so much from the external color, which is mostly a dark olive, passing into dingy white, as from that of the fat, so



1, Hawkbill Turtle (*Caretta imbricata*); 2, Green Turtle (*Chelonia mydas*).

much prized by epicures.—Another excellent species of T. is the EDIBLE T. (*Chelonia virgata*) of the East Indies, which is fre-

quently four or five feet long.—The HAWKBILL T. (*Caretta imbricata*), found in the warmer parts of the Atlantic Ocean, in the Indian Ocean, and in the Red Sea, is particularly valuable, as yielding the best Tortoise-shell (q. v). It is one of those turtles which have the plates of the carapace imbricated, or overlapping one another like tiles. Its flesh, although not so much esteemed as that of the Green T., is a good article of food; its eggs are also very good.—There are other turtles, having the head of a larger size, and the jaws curved towards one another at the extremity, of which one is the LOGGERHEAD T. (*Caouana olivacea*), a native of the warmer parts of the Atlantic, and a very rare visitant of the British seas. Others, again, have the carapace and plastron not hard, but leathery, and sometimes soft enough to yield to the pressure of the finger. One of these is the CORIACEOUS T. (*Sphargis coriacea*) of the Mediterranean and Atlantic, occasionally, but rarely, found even on the British shores. It attains a very large size, even greater than any of the species already described, but its flesh is course and unpleasant.

The French, encouraged by their success in pisciculture, have attempted to introduce the Green T. on the southern coasts of France. There has not yet been time to prove the success of the experiment.

TURTLE-DOVE, or TURTLE (*Turtur*), a genus of *Columbidæ*, having the bill more slender than pigeons, the tip of the upper mandible slightly bent down. They are also more slender and

Turtle-dove (*Turtur communis*).

elegant in form than pigeons, and generally smaller; the wings are longer and more pointed; and the tail is longer, rounded, or slightly graduated. There are numerous species, natives of warm climates. Their soft and gentle, yet loud *cooing* has attracted attention even more than their beauty, and made them a favorite subject of allusion in poetry. *T. risorius*, the most common species in Palestine, and probably the one intended in the Song of Solomon, is about ten inches in entire length, with a short tail; the general color gray tinged with red; the upper parts greenish brown, with a black collar on the back of the neck. It is often kept in confinement, and becomes very tame.—Very similar to this in size and form is the COMMON TURTLE-DOVE (*T. communis*), a native of almost all the warmer parts of the Old World, a summer visitant of the south of Europe and of England, where it is chiefly found in the south-eastern counties. In Kent, flocks of twenty or more are often to be seen, particularly in the pea-fields. The tail is long and much rounded; the plumage soft, and without gloss, exhibiting finely-mingled tints of gray and brown; the crown of the head bluish; all the tail-feathers tipped with white; a black patch on each side of the neck. Other species of turtle dove, from different parts of the world, as well as these, are not unfrequently kept in confinement, and are very gentle, if not very intelligent pets. Their cooing resounds through a whole house.

TU'SCAN ORDER OF ARCHITECTURE, one of the five Classic Orders (q. v.), being a Roman modification of the Doric style with unfluted columns, and without triglyphs. It is the simplest of the orders.

TU'SCANY, formerly a sovereign grand duchy in the west of Italy, lying for the most part, but not wholly, south and west of the Apennines, in lat. 42° 20′—44° 10′ N., and long. 10° 15′—12° 20′ E. Area, 8440 sq. m.; pop. in 1860, at the date of its annexation to Sardinia, 1,800,000; (1881) 2,208.516. The north and north-east of the country is filled with mountains, whence numerous rivers and streams flow down to the sea, the most important of which are the Arno (q. v.), the Serchio, and the Ombrone. This district is also the source of the Tiber (q. v.). The rest of T. is an undulating region of hills and dales, except the coasts, which are flat and marshy. Of these marsh-lands, the largest is (or was) the *Maremma* (q. v.). The principal crops are maize, wheat, rye, and barley. Wine and oil are also abundantly produced. Mules, cattle, and sheep are reared in great numbers; there are flourishing manufactures of silks, woollens, and straw (for hats); and a very considerable trade is carried on in articles in marble, alabaster, porcelain, coral, wax, &c. T., as a *compartimento* of the kingdom of Italy, comprises the administrative provinces of Arezzo, Firenze, Grosseto, Livorno, Lucca, Massa e Carrara, Pisa, and Siena.—The ancient history of T. is described at length in the article ETRURIA, and its medieval history in the article FLORENCE. It is only necessary to add that modern T. was first constituted in its present dimensions in 1569, when Cosmo de Medici became Grand Duke of Tuscany. On August 16, 1860, the national assembly of T. pronounced the deposition of the reigning dynasty; and four days later, declared for annexation to Sardinia.

TUSCARO'RAS, a tribe of North American Indians, who, at the settlement of North Carolina, had 15 towns on the Tar and Neuse rivers, and 1200 warriors. In 1711, they began a war with the settlers, and after a series of savage encounters, were defeated, and joined the Iroquois in New York, where they became allies of the English, and where about 50 familes still reside on an Indian Reservation in the western part of the state.

TU'SCULUM, anciently a city of Latium, about 15 miles south of Rome, was situated on a ridge of hills known as the *Colles Tusculani*, and forming part of the Alban range. We ought not to infer from its name (as Festus does, *s. v. Tuscos*) that it had any connection with the Etruscans. Mythically, it derived its origin from Telegonus and Circe; but we catch the first certain glimpse of its historical existence towards the close of the regal period at Rome. Then, however, it appears in the enjoyment of a high degree of prosperity and power, and therefore its beginnings are in all probability remote. Octavius Mamilius, ruler of T., and the foremost prince in Latium, married a daughter of Tarquin the Proud (see TARQUINIUS), and played a conspicuous part in the last of the great struggles made by the banished tyrant to regain his kingdom. On that occasion, the Latins were so thoroughly beaten (see REGILLUS LAKE) that they were fain to enter into an alliance with the victor, and ever after—except in the single instance of the Great Latin War 340—338 B.C.)—remained steady in their attachment and fidelity to Rome. As early as 378 B.C., the inhabitants of T. received the Roman franchise, and among its many distinguished *gentes* may be specially mentioned the Porcian, which produced two famous men of a thoroughly 'Roman' stamp, Cato *Major* and Cato *Minor*. Towards the close of the Republic, T. became a favorite country residence of the wealthy Romans. Lucullus had a villa here (with parks and gardens extending northwards for miles); so had Cato, Brutus, Hortensius, Crassus, Cæsar, and Cicero. The villa (*Tusculanum*, Tusculum House) of the great orator is peculiarly memorable as the place where he composed many of his philosophical works, and particularly those charming dialogues (*Tusculanæ Disputationes*) which derive their name from it. Long after the Western Empire had fallen, T. continued to flourish. As late as the 12th c., the ancient city continued entire; but in 1191 it was stormed by the Romans (between whom and the Tusculans there had long been a deadly feud), and razed to the ground. It never recovered from this blow; but lower down there arose from its ruins, if we may so speak, the town of Frascati (q. v.). Many fine remains of ancient T. have been dug up in recent times, the most remarkable, perhaps, being the amphitheater, theater, and city walls.

TU'SSAC GRASS (*Dactyliscæspitosa*), a large grass of the same

Tussac Grass (*Dactylis cæspitosa*).

genus with the Cock's-foot Grass of Britain, a native of the Falk-

land Islands, remarkable for forming great tufts, sometimes five or six feet in height, the long tapering leaves hanging over in graceful curves, from five to eight feet long, and an inch broad at the base. It is, however, sufficiently delicate to be very good food for horses and cattle; and the attention of British farmers having been very strongly called to it, it has been tried with success in the Hebrides, Orkney Islands, and other localities in which there is a peaty soil exposed to winds loaded with sea-spray, to which it promises to be a very valuable acquisition. The inner part of the stem, a little above the root, is soft, crisp, flavored like a hazel-nut, and often eaten by the inhabitants of the Falkland Islands. The young shoots are boiled and eaten as asparagus.

TUSSILA'GO, a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*, having bracteæ with a membranous edge, a naked receptacle, a hairy pappus; the florets of the ray pistilliferous, in many rows, tongue-shaped; those of the disc perfect, few. *T. Farfara*, sometimes called COLT'S-FOOT, is the only British species. It has single-flowered scaly scapes, appearing before the leaves in early spring, the flowers yellow, both disc and ray; the leaves heart-shaped, angular, downy beneath. The leaves have a somewhat glutinous and subacrid taste, and are

Colt's-Foot (*Tussilago Farfara*).

used either by smoking, or in the form of a decoction, for relief of asthmas and troublesome coughs. They have been used with advantage in scrofula.—Nearly allied to this genus is *Petasites*, of which one species, the BUTTER BUR (*P. vulgaris*, formerly *Tussilago Petasites*), is a native of Britain. The leaves resemble those of *Tussilago Farfara*, but are much larger; the flowers also appear before the leaves, but in a dense thyrsus, and are of a pale flesh-color. The flowers of both are much sought after by bees, as are those of *Petasites* (formerly *Tussilago*) *alba*, and *P.* (formerly *T.*) *fragrans*, natives of the south of Europe, not uncommon in our flower-gardens.

TU'SSOCK MOTH (*Laria pudibunda*), a grayish-white moth, about an inch long, the upper wings freckled, with four irregular

Tussock Moth and Caterpillar.

darkish lines, the under wings nearly white. The caterpillar does great mischief in hop plantations, and is known by the name of *Hop-dog*.

TUTOR, in the Law of Scotland, means a guardian of the person as well as of the estate of a boy under 14, or a girl under 12; that is, while they are in a state under that of puberity. At common law, a father is both tutor and curator of his children. Tutors are divided into three kinds: tutors nominate, tutors at law, and tutors dative. A tutor nominate is he whom the father, who has the sole power of naming a tutor, has appointed by will or deed. Sometimes several are appointed to act jointly. In general, no security is required from a tutor nominate, because the father's choice implies that the tutor is a trustworthy person. Yet, if he is *vergens ad inopiam*, or of doubtful character, security will be required. Tutors at law are those whom the law will appoint in a certain order of relationship, if there is no tutor nominate. No cognate, i. e., no relation by the mother's side, will be appointed; but the nearest agnate, i. e., a person related through the father, will be appointed, if a male, and of the age of 25, and able to give security. The tutor, however, has only the custody of the pupil's estate, while the custody of the pupil's person is given to the mother or nearest cognate. A tutor dative is named by the crown when there is no tutor nominate or tutor at law. Tutors other than tutors at law have the custody of both the person and estate of the pupil, and act alone for the pupil, suing for and discharging all debts due, and managing the property. The tutor's office is gratuitous, and he is not allowed to derive any profit from it, or to do acts inconsistent with his duty. For some purposes, however, such as selling the pupil's land, he must have the sanction of the Court of Session. He is bound, on entering office, to make up an inventory, and must keep proper accounts.

TU'TTLINGEN, a town of Würtemberg, on the right bank of the Danube, 20 miles west-south-west of Sigmaringen. It has manufactures of knives, needles, cloth, cotton, hosiery, linen, and silk, and carries on besides some trade in corn. Pop. (1880) 8022. T. is historically notable as the scene of a battle in 1643, during the Thirty Years' War, in which an Austro-Bavarian force, under Hatzfeld and Mercy, defeated the French.

TUTTY-POWDER, an impure oxide of zinc, which is found in the chimneys of the furnaces in which the ores of that metal are roasted. It has some value in medicine.

TUTUI'LA, an island in the Pacific, belonging to the group of the Navigators' or Samoan Islands (q. v.), is about 17 miles long and 5 miles broad, and is said to contain nearly 5000 inhabitants. The coast is bold, and the island is traversed by sharp-peaked mountains, highly picturesque in outline, and rising to from 2500 to 3500 feet. The harbor of Pago Pago, an ancient crater, is very deep, and completely landlocked by lofty mountains. The mountains are clothed with dense green forests, comprising the bamboo, banana, cocoa-nut tree and other palms. Between the months of November and May, fearful hurricanes break over the island, and so powerful is their effect, that they are said by the natives to *skin the land.—Cruise of H.M.S. Fawn*, by T. Hood (Edmonston and Douglas, Edin. 1863).

TU'YERE, the nozzle or small pipe through which the air is forced into a blast-furnace.

TVER, a government of Great Russia, bounded on the N.W. by the government of Novgorod, and on the S.E. by those of Moscow and Smolensk. Area, 25,080 sq. m.; pop. (1880) 1,638,196, mostly Russians. In configuration, the government is an elevated tableland, forming part of the Valdaï plateau, which throws off rivers that run north-west into the Baltic, and south-east into the Caspian Sea respectively. The chief rivers are the Volga, with its affluents, the Tvertza and the Mologa; the Western Dwina, the Msta, and the Tsna. Most of these rivers rise in the north-west of the government, where there are numerous lakes. The climate is somewhat severe; the soil is not fertile, the most of the government being in marshes, and in woods and tracts of turf, the working of which, however, is as yet insignificant. Rye and oats are the only cereals produced with success. The employments of the inhabitants are principally agricultural; but other modes of industry are gradually developing themselves, especially along the great commercial highways of the government; 50,000 men are employed in the lake-fisheries, which are important, and in the conveyance of goods.

TVER, a city of Great Russia, capital of the government of the same name, stands at the confluence of the Volga with the Tvertza, 348 miles south-east of St. Petersburg, by the St. Petersburg and Moscow Railway. The Volga, which is here wider than the Thames at London Bridge, becomes first navigable for steamers at this town, although there is much difficulty in accomplishing the voyage hence to Nijni-Novgorod, when the water is low. Among the important buildings of T. are 2 monasteries, 23 churches, and 47 factories of different kinds, of which the chief is the cotton-mill of Kaoulin and Zologin, in which 1500 people find employment. Nail-making is an important branch of industry. The situation of T. is very convenient as a landing-place, in consequence of the St. Petersburg and Moscow Railway here meeting the Volga, the principal artery of the commerce of the interior of Russia. The commercial prosperity of the town is continually increasing. Cereals and iron brought from Siberia are the chief articles of commerce, and besides the articles already mentioned, linen, leather, and paper are largely manufactured. Pop. (1880) 38,246.

TWEED, the most famous of Scottish rivers, rises in the extreme south of Peeblesshire, at an elevation of 1500 feet above sea-

level. It flows north-east to near Peebles, thence east by south to its junction with Ettrick Water, and thence in an easterly and finally north-easterly direction to its embouchure in the North Sea at Berwick-on-Tweed. The river drains great part of Peeblesshire, traverses the northern districts of Selkirk and Roxburgh shires; and in its lower course it forms the boundary between Berwickshire on the north-west and the English border-land on the south-east. It receives the Ettrick, the Teviot, and the Till from the south; and the Gala, Leader, and Adder from the north. The T. passes Peebles, Innerleithen, Melrose, Dryburgh Abbey, Kelso, Coldstream, and Berwick, where it falls into the sea after a course of 96 miles, and having drained an area estimated at 1870 sq. m.—greater than that of any other Scottish river, except the Tay. The highest regions through which the river flows are for the most part of the nature of moors; the middle course of the river is through narrow valleys, flanked by hills, clothed with woods or in pasture; and its lower course, through widespread valleys, picturesque and beautiful, and through the rich plain of the Merse (see BERWICKSHIRE), has many attractions. The tide is felt at Norham Castle, ten miles from the mouth of the river; but there is little or no navigation above Berwick. Possibly the T. owes its fame more to the associations which connect themselves with it, than to the charms of the scenery through which it flows. Traversing the heart of the 'Borders,' it has been witness to many a foray between the warrior-farmers north and south of its banks, as well as many a deadly struggle between the rival Houses of the south of Scotland; and its name is frequent in ballad and story. The T. is famous as a salmon and trout stream.

TWEE'DMOUTH. See BERWICK-ON-TWEED.

TWEEDS, a name originally given to a certain kind of woollen cloth largely made at Galashiels, Hawick, Selkirk, and other places in the south of Scotland. This kind of cloth was at first known as *tweels* (twills), so called from being woven diagonally; but owing to an accidental misreading of an invoice, *tweels* was superseded by the popular and appropriate name of *tweeds*. This cloth is of an open, soft, flexible nature; differing from English superfine cloth in not being so finely spun or closely woven, and most of all in not being so thoroughly felted. The fabric of broadcloth is not intended to show any appearance of weaving; whereas in tweeds, the whole art of weaving is capable of being developed in novel and fanciful designs, admitting of great variety of texture. Tweeds manufactured in Scotland are further characterized by their purity of color and genuineness of make—shoddy, mungo, and cotton-warp not being yet used in the production of even the cheaper kinds; though such has been the success of the article, that it is now largely imitated in the English manufacturing districts in all qualities of material. The processes of spinning and weaving are similar to those adopted for English broad-cloth, the machinery being, in the main, alike. As a manufacture, it is of comparatively recent date. At the beginning of the present century, the weavers of Galashiels, then a mere village, manufactured, as they had done for more than 200 years, a kind of coarse woollen cloth known as 'Galashiels grays,' made from wool grown on the surrounding hills. Between 1820–30, the first real break from 'Galashiels grays' occurred, when a beginning was made in the manufacture of woollen cloth in the 'shepherd's check' pattern. This fabric, partly by the patronage of Sir Walter Scott and many of his prominent contemporaries, at once, under its new name of tweeds, became popular. The warmth, comfort, and durability of tweeds, as well as their suitability for all seasons, gradually led to their being preferred to the hard tartans, Manchester linens, and Nankeens of former days; and eventually, even to English doeskins. The demand for them rapidly increased.

Galashiels, from a place of 600 inhabitants in 1778, had risen in 1881 to a place of over 15,000 inhabitants. The neighboring towns of Hawick and Selkirk have equally shared in this prosperity. Nor has the manufacture confined itself to Tweedside, but has spread northwards to Aberdeen, Elgin, and Inverness; southwards to Dumfries, and into Cumberland; and westwards to Stirlingshire and Ayrshire, and even to the Hebrides. About 1858, a great impetus was given to the manufacture, by the introduction of improved wool-washing and drying machinery, and especially the successful employment of self-acting mules for the drawing and spinning of the yarns direct from carding-engine, condenser, and rovings. Subsequently, in order to a division of labor and capital, factories were erected for spinning only, and others for weaving and finishing. The wools used in the South of Scotland for the production of tweeds are chiefly those imported from Australia and the Cape of Good Hope; though in some other districts of Scotland Cheviot, Danish, and other wools are also used. This manufacture is now one of the chief staples of Scotland, and its success has been greatly due to the sound quality of the raw material made use of in the Scotch trade, as well as to the good taste and practical knowledge displayed by the makers. The Jury Report on the woollen goods exhibited in the International Exhibition of 1862 says: 'To the Scotch manufacturers belongs the credit of having found out what the public like, and of having led for a considerable period the public taste.' In the last-named year, the total annual value of the tweeds made in Scotland was estimated at £1,600,000; but so great has been the development of the trade, and the increase of the productive power, since then, that the manufactories, when fully employed, were estimated in 1881 to be capable of turning out tweeds to the annual value of £4,500.000. About half this sum would represent the value of the wool used.

TWELFTH-DAY. See BEAN-KING'S FESTIVAL and EPIPHANY.

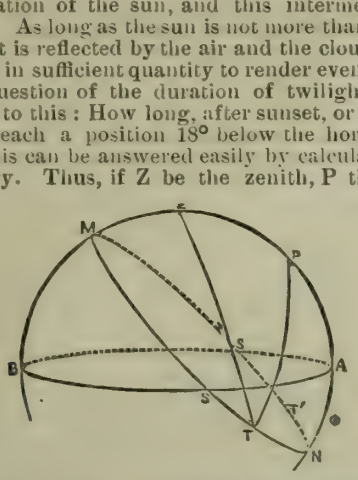
TWELVE TABLES (Lat. *Lex* or *Leges Duodecim Tabularum*), the name given to the earliest code of Roman law. According to the ancient account, the code originated in this wise: In the year 462 B.C., a tribune, C. Terentilius Arsa, brought forward a proposal to appoint five men to draw up a set of laws, with the view of limiting the *imperium* of the consuls. The aristocracy, always furious, selfish, and unwise in their struggles with the commons of Rome, violently resisted this reform, and for eight years a fierce parliamentary warfare—if we may so call it—was carried on between the two orders, which ended in a sort of partial victory for the plebeians; that is to say, in 454 B.C., the senate assented to a *Plebiscitum* (see PLEBISCITE), in virtue of which three commissioners were despatched to Greece to report on the laws in force among the different states there. After a lapse of two years, they returned; and it was then agreed that ten men (*decemviri*) should be selected to draw up a code (*legibus scribundis*); but the patrician or aristocratic party took care that these decemvirs should all be chosen from their body. The story of the political fortunes of the Decemviri (q. v.), and of the fate of the leading decemvir, Appius Claudius (q. v.), are well known, though we believe that it has not come down to us in a very historical dress; indeed, it is politically quite unintelligible in the main. But what concerns us here is not the political career of these men, but the character of the legislation ascribed to them. We say ascribed to them, for the whole story of the foreign travels of the commissioners, and of their eclectic procedure in the matter of the Solonian and other laws, is so completely at variance with the simple, narrow, *home-centered* feelings of the Roman people at that early time, and with the thoroughly *Italian* stamp of the legislation embodied in the 'Twelve Tables,' that it has very reasonably been doubted whether such a commission ever existed, or, if it did, whether it did not acquire its information from the Hellenic cities of Lower Italy. Niebuhr, however, thinks the embassy to Greece just possible, though he is obviously reluctant to go further, and affirm that it really did occur (*Lect. Rom. Hist.*, vol. i. p. 296), and points out very clearly the difference between the Roman and Greek laws. 'All,' says he, 'that is distinctive in the Roman law, is not to be found in the Athenian; and distinctive it is with regard to the rights of persons and things.

'Never had the Greeks the right of paternal authority, like the Romans; never the law, that the wife, by her marriage, entered into the relation of a daughter and co-heiress; never the *jus mancipii*, the formality in the purchase. The difference between property by formal purchase and simple property, between property and hereditary possession, does not exist in the Attic law; the Roman law of inheritance, the Roman law of debt, the Roman system in contracts of borrowing and lending, are quite foreign to the Athenians' (*Lect. Rom. Hist.*, vol. i. pp. 295, 296). These differences, and the number could easily be enlarged, have induced modern historians to adopt the theory—if, indeed, that should be called a 'theory' which, in the eyes of all sound investigators, is a demonstrated fact—viz., that the Twelve Tables, instead of being an eclectic assortment of foreign laws, hitherto unknown to the people of Rome, and imposed on them for the first time, really expressed the first effort towards the codification of the consuetudinary law of the Latin race.

According to Livy (iii. 57) and Diodorus (xii. 56), the laws of the Twelve Tables were cut on bronze tablets (whence their name), and put up in a public place. Whether these tablets were destroyed by the Gauls when they sacked and burned Rome (390 B.C.), is uncertain. At all events, the later Romans entertained no doubt that the collection which existed in their time was genuine. The only portions extant are those which have been quoted by jurists and others. The Twelve Tables is described by Livy (iii. 34) as the *fons publici privatique juris*—the fountain of public and private law. Cicero (*de Or.* i. 43, 44) speaks of them with high praise. In the course of years, the *Jus Publicum*, as could not fail to be the case, was greatly changed, but the *Jus Privatum* of the Twelve Tables continued the fundamental law of the Roman state. See George Long's article 'Lex,' in Smith's *Dic. of Gr. and Rom. Ant.*; Niebuhr's *Lect. Rom. Hist.* (English translation, vol. i. pp. 295—319), Mommsen's *Hist. of Rome* (English translation, vol. i. book i. chap. 11, and book ii. chap. 2.) The most complete essay on the history of the extant fragments of the Twelve Tables is to be found in Dirksen's *Uebersicht der bisherigen*

Versuche zur Kritik, und Herstellung des Textes der Zwölf-Tafel-Fragmente (Leip. 1824).

TWI'LIGHT. If the earth had no atmosphere, we should be involved in total darkness from the instant of sunset till the instant of sunrise. The transition from day to night, and from night to day, occupies an interval which varies with the latitude and the declination of the sun, and this intermediate stage is called twilight. As long as the sun is not more than 18° below the horizon, its light is reflected by the air and the clouds and vapors suspended in it, in sufficient quantity to render even distant objects visible. The question of the duration of twilight is, therefore, simply reduced to this: How long, after sunset, or before sunrise, does the sun reach a position 18° below the horizon of a given place? And this can be answered easily by calculation in spherical trigonometry. Thus, if Z be the zenith, P the pole of the



heavens, ASB the horizon, and MSTN the (small) circle which the sun describes about the pole; there is twilight while the sun moves from T to S. ZT being an arc of 108°. In the spherical triangle ZPT, we know the three sides, for ZP is the colatitude of the place, PT the sun's polar distance, and ZT is 108°. Hence we can calculate the angle ZPT, which is the sun's *hour-angle;* and from this we find at once how long before or after noon the sun passes the point T. If ZT' be also 108°, we see that it is night while the sun moves from T' to T, day while it moves from S (through M, its meridian position) to S', morning twilight from T to S, and evening twilight from S' to T'. Make ZC = 108°, then, if PN be less than PC, but greater than PA, there will be no point of the sun's path (MS'NS) so far as 108° from Z; and therefore the points T and T' will not exist. In this case the sun will set and rise, but there will be *no night*, or, rather, twilight will occupy the whole interval from sunset to sunrise. This cannot occur in low latitudes, but does occur during certain periods of the year in northern and southern countries. For

PN is 90° — sun's declination,
PC is latitude + 18°,

and our condition is, therefore, that 90° — sun's declination, while greater than the latitude, does not exceed it by more than 18°. Or, in a simpler form, the latitude, together with the sun's declination, must lie between 90° and 72°.

Now, the sun's greatest declination is about 23° 30', and therefore, in lat. 48° 30' (72°—23° 30'), there will be one night in the year (at the summer solstice) consisting wholly of twilight; for higher latitudes, more; and for lower, none. Some curious problems on this subject, such as the finding the time of year at which the twilight is longest in a given latitude, were among the early triumphs of the differential calculus. A curious phenomenon, known as the *afterglow*, or second twilight, often seen in the Nubian desert, is referred by Sir John Herschel to a *second* reflection of solar light in the atmosphere. Lambert and others had previously speculated on the possibility of second and even third twilights, but in their time there was no recorded observation of such appearances.

Attempts have been made to deduce from the duration of twilight the height of the earth's atmosphere; and from various measurements which have given results agreeing fairly with each other, 50 miles has been assigned as a probable value. But, till we know more of the law of temperature in the atmosphere, we have no very direct means of testing the correctness of such results. In all probability, they are too small, as, indeed, we might expect, if we suppose the higher regions of the atmosphere to be much attenuated, and, therefore, reflecting little light. Besides, the ignition of meteorites is believed to have taken place at altitudes of more than 50 miles; and auroral arches have been observed at least 60 miles high.

TWILL, a woven fabric, in which the warp is raised one thread, and depressed two or more threads for the passage of the weft: this gives the structure a curious appearance of diagonal lines.

TYBEE', an island and sound at the mouth of the Savannah River, Georgia, U.S. The sound is a bay of the Atlantic, extending from Tybee Island on the south to Hilton Head on the north, opening to Point Royal entrance by Cooper's River, Wall's Cut, Lazaretto Creek and other channels. The island is six miles long by three wide; and was occupied in 1861 by General Sherman, who erected batteries for the reduction of Fort Pulaski, which capitulated April 11, 1862.

TY'BURN, previously to 1783, the chief place of execution in London, was situated near the northeastern corner of Hyde Park, at the western extremity of Oxford Street, and at the point where the Edgeware and Uxbridge Roads unite. It took its name from a small stream which ran from Hampstead to the Thames through St. James's Park, but which has long since disappeared. The gallows seems to have been a permanent erection, resting on three posts, whence the phrase 'Tyburn's triple tree.' Wooden galleries were erected near it for the accommodation of spectators. Hogarth's Idle Apprentice was executed at Tyburn; and the print which represents the scene, gives a good idea of an execution there. The criminal was conveyed all the way from Newgate to Tyburn, a distance of about two miles, by Holborn and the Tyburn Road, now Oxford Street, but in the 17th c. a 'sloughy country road.' As Oxford Street and London generally spread westward, the long procession became inconvenient, and the place of execution was, on 9th December 1783, removed to the Old Bailey, or Newgate, where it has since remained.

In early times, the frequency of executions rendered the office of hangman more important than it has since become. Throughout the reign of Henry VIII. (38 years), the average number of persons executed in England was 2000 annually. In our own time, the corresponding number has sunk to twelve. Formerly, the hangman must have had almost daily work. This fact, taken in connection with the increase of population, and the employment of the Tyburn hangman in state executions, explains the important place he occupied in popular imagination, and the frequent mention of him in contemporary literature. The first on record was 'one Bull,' who flourished in 1593. He was succeeded by Derrick, referred to in the *Fortunes of Nigel*, and mentioned in a political broadside as living in 1647. In the ballad of *The Penitent Tailor*, published in the same year, reference is made to his successor, Gregory Brandon—

> 'I had been better to have lived in beggary,
> Than to have fallen into the hands of Gregory.'

In Gregory's time, it became the custom to prefix 'squire' to the names of the Tyburn hangmen. This is said to have originated in a practical joke played upon the Garter King-of-arms. He was induced to certify the authenticity of a coat-of-arms of a gentleman named Gregory Brandon, who was supposed to reside in Spain, but who turned out to be the hangman. The Garter King was committed to prison for his negligence, and hence the popular error, that 'an executioner who has beheaded a state prisoner becomes an esquire.' Gregory was succeeded by his son Richard. 'Squire Dun' followed; and after him came Jack Ketch, or Squire Ketch, first mentioned in 1678. He was the executioner who beheaded Lord Russell and the Duke of Monmouth. Lord Macaulay, in speaking of the execution of the latter, says: 'He then accosted Jack Ketch, the executioner, a wretch whose name has, during a century and a half, been vulgarly given to all who have succeeded him in his odious office. "Here," said the duke, "are six guineas for you. Do not hack me, as you did my Lord Russell. I have heard that you struck him three or four times. My servant will give you some gold, if you do the work well." '—See *History of England*, vol. ii. p. 205. What followed, it is needless to repeat. After this time, the 'kings of Tyburn' all received the name of Ketch, and their patronymics seem to have been less noted. Jack Ketch's immediate successor was 'one Rose, a butcher;' and the last of the Tyburn hangmen was Edward Dennis, condemned for taking part in the No-Popery Riots, but respited, it is believed, on the ground that his services could be ill dispensed with.

Among the most memorable executions at Tyburn were those of Elizabeth Barton, the Holy Maid of Kent, and her confederates (1534); John Felton, the murderer of the Duke of Buckingham (1628); Jack Sheppard, the highwayman (1724); Jonathan Wild, the thief-catcher (1725); Mrs. Brownrigg, the murderer of an apprentice (1766); Dr. Dodd (q.v.), found guilty of forging a bond for £4200 (1777); and the Rev. Henry Hackman, murderer of Miss Reay (1779). The associations connected with Tyburn have naturally led to the suppression of the name in the street nomenclature of London; but it survives in that given to the quarter of the metropolis described by Mr. Thackeray as 'the elegant, the prosperous, the polite Tyburnia, the most respectable district in the habitable globe.'—See Chambers's *Book of Days*, vol. ii., and *Notes and Queries*, 2d series, vol. ii.

Under a statute of William III. (10 and 11 c. 23, s. 2), prosecutors who secured a capital conviction against a criminal were exempted from all manner of parish and ward 'offices within the parish in which the felony had been committed.' Such persons obtained what was called a 'Tyburn ticket,' which was enrolled with the Clerk of the Peace, and sold like any other property.

The privilege the tickets conferred must have been highly valued, as they sold at a high price. 'Last week,' says the *Stamford Mercury* of 27th March 1818, 'a Tyburn ticket sold in Manchester for £280.' The act under which they were granted was, however, repealed a few months later, by 58 Geo. III. c. 70, passed 3d June 1818; and since then they have ceased to be recognized.—See *Notes and Queries*, 2d series, vol. xi.

TYE, CHRISTOPHER, an English musician of note of the 16th century. He was born at Westminster in 1500, educated in the King's Chapel, and held the office of musical instructor to Edward VI. when Prince of Wales. He received the degree of Musical Doctor from the university of Cambridge in 1545, and from Oxford in 1548. Under Elizabeth, he was organist to the Chapel Royal, and produced various services and anthems, some of which are yet in repute among musicians. Dr. T.'s general scholarship was considerable.

TY'LDESLEY, a well-built and increasing town of Lancashire. Pop. with Shackerley, (1881) 9953.

TYLER INSURRECTION. A poll-tax of three groats, imposed in 1381, during Richard II.'s minority, to defray the expenses of the war with France, roused the spirit of resistance among the common people. An insult offered by one of the tax-gatherers to a blacksmith's daughter in Essex, led to the first open outbreak. The populace rose everywhere, and under the conduct of two peasants, named Wat Tyler and Jack Straw, they mustered in great force at Blackheath, committing violence on all who came into their hands. They had an interview with the king, who, finding resistance vain, promised aquiescence with their demands, which included a general pardon, freedom of commerce, and the abolition of villeinage. Meantime, a party of insurgents had broken into the Tower, and murdered the Primate and Chancellor, and the Treasurer. The king, encountering Tyler at the head of the rioters in Smithfield, invited him to a conference, when he conducted himself with an insolence that led Walworth, the mayor, to despatch him with a dagger. The king immediately, with great presence of mind, offered himself to head the populace, and leading them to the fields of Islington, where a body of troops had been collected for his Majesty's protection, ordered the rioters to disperse. The revolt, however, was not extinguished without considerable bloodshed.

TYLER, JOHN, tenth President of the United States, born in Charles City county, Virginia, March 29, 1790. His father was an officer of the army in the Revolution, and a judge of the Federal Court of Admiralty. John entered William and Mary College at 12, and graduated at 17, was admitted to the bar at 19, and almost immediately entered upon a large practice. At 21, he was elected to the state legislature, supporting the policy of Jefferson, Madison, and the Democratic party. He was almost unanimously elected five times; and in 1816, entered Congress. During his long congressional career, he sustained all the measures of the State Rights party. In 1825, he was elected governor of Virginia; and in 1827, senator in Congress. He supported General Jackson and the Democratic policy; but sided with Mr. Calhoun on the question of nullification. At a later period, however, 1833—1834, he supported Mr. Clay's resolutions of censure on General Jackson for removing the government deposits from the United States bank. From this period, he became an active partisan of Henry Clay, the candidate of the Whig or Republican party; and in 1840, was elected Vice-president of the United States, with General Harrison as President. President Harrison died April 4, 1841, a month after his inauguration, by which event Mr. T. became President. He began his administration by removing Democrats from office, and appointing Whigs, and pronouncing in favor of Whig measures, but soon after vetoed a bill for a United States bank, passed by Congress; several members of the cabinet resigned; and after some changes, John C. Calhoun, the great Southern Democratic statesman, became Secretary of State. The most important act of his administration was the annexation of Texas, March 1, 1845. At the close of his term of office, he retired to private life until 1861, when he was President of a Peace Convention at Washington. Failing in his efforts at a compromise, he gave his adhesion to the Confederate cause, and was a member of the Confederate Congress until his death, at Richmond, Jan. 1862.

TYLO'PHORA, a genus of plants of the natural order *Asclepiadaceæ*, natives of the East Indies, New Holland, &c., with a wheel-shaped corolla, and a 5-leaved fleshy coronet. *T. asthmatica*, a native of the coast of Coromandel, has a high reputation as a medicinal plant. Its root possesses properties similar to those of ipecacuanha, and has been found of great use in dysentery.

TY'MPANUM (Lat. a drum), in Anatomy, the middle ear (see EAR). In Architecture, the flat space left within the sloping and horizontal cornices of the pediment of Classical Architecture, usually filled with sculpture (see GRECIAN ARCHITECTURE, fig. 2); also, the space between the arch and lintel of doorways in Gothic Architecture, which is frequently enriched with sculpture.

TYNDALE, or TINDALE, WILLIAM, an eminent English reformer and martyr, well known as a translator of the Bible, was born about 1484. He was educated first at Oxford, and afterwards at Cambridge, and was, from his youth, as Foxe says, 'singularly addicted to the study of the Scriptures.' After leaving Cambridge, he became tutor and chaplain in the house of Sir John Walsh, a knight of Gloucestershire, where he frequently engaged in religious disputes with the clerical dignitaries of the neighborhood, and soon incurred their wrath by what they deemed the heresy of his opinions. He went to London about the middle of 1523, bent upon the fulfilment of his long-cherished desire of translating the New Testament into English. Failing, however, to obtain the patronage he expected in carrying out this intention, he retired to Germany in 1524. Here his translation of the New Testament was published in 1525 or 1526, and conveyed into England. This work, although denounced by government, was yet so eagerly received by the English, that several reprints of it were produced by the Dutch printers within the next few years. T. continued on the continent, writing tracts in advocacy of the reformed doctrines; in 1530 he published a translation of the Pentateuch, and in 1531, one of the prophet Jonah. In 1533 he took up his abode in Antwerp, where, in 1534 and 1535, he published two revised editions of his New Testament. In 1535 he was treacherously arrested, and, after a confinement of 16 months, was publicly strangled and burned as a heretic at Antwerp in 1536.

T. was a man of great learning as well as talent, and his own writings, in addition to his translations, show how well adapted he was for the great work of his life, so fearlessly carried out. Our modern version of the New Testament is substantially T.'s translation with modernized spelling. See *William Tyndale*, by Rev. R. Demaus, M.A. (1871).

TYNDALL, JOHN, physicist, was born 21st Aug. 1820, at Leighlin Bridge, County Carlow. He had few educational advantages. On returning from the continent, where he received part of his education, he found employment in one of the subordinate grades of the Ordnance Survey. He was afterwards appointed Teacher of Natural Philosophy at Queenwood College, Stockbridge, and there commenced those original investigations which have distinguished him among the explorers of science.

In January 1853, T. communicated his first paper to the Royal Society, *On Molecular Influences—Transmission of Heat through Organic Structures*. It exhibits much of that skill in experimenting and fertility of resource which characterize his subsequent researches, and illustrates certain important questions in natural philosophy.

Year by year from the date above mentioned, T. has extended our knowledge of science. His field of research is wide and varied, as exemplified by the subjects of his papers published in the *Philosophical Transactions—On the Vibrations and Tones produced by the Contact of Bodies having Different Temperatures* (1854); *On the Physical Phenomena of Glaciers* (1857); *On Some Physical Properties of Ice* (1858—1859); *On Transmission of Heat through Gaseous Bodies* (1859); a series on *Radiation*, six papers (1861—1865); *On Calorescence* (1865); *On the Invisible Radiation of the Electric Light* (1865). During the year 1867, he lectured on *Sounding and Sensitive Flames*.

In 1855, and again in 1861, T. was appointed to deliver the Bakerian Lecture to the Royal Society: the subjects were: *On the Nature of the Force by which Bodies are repelled from the Poles of a Magnet;* and *On the Absorption and Radiation of Heat by Gases and Vapors, and on the Physical Connection of Radiation, Absorption and Conduction*, the latter being one of the series on *Radiation* above mentioned. The publication of this series of papers marks a period in the history of scientific research, for the facts therein set forth, and the conclusions drawn from them, demonstrate the relation of aqueous vapor to radiant heat, and elucidate certain meteorological phenomena which connect themselves with some of the profoundest and most interesting questions of cosmical science.

In 1864, the Council of the Royal Society awarded to T. their Rumford medal, in recognition of his scientific researches, particularly as bearing on Light and Heat. As a lecturer on scientific subjects, T. enjoys a high reputation. His lectures at the Royal Institution and the School of Mines have been marked by fullness of knowledge and clearness of illustration. T. has experimented and written on the subject of germs, and on the acoustic transparency or cloudiness of the atmosphere.

In 1852, T. was elected a Fellow of the Royal Society. In 1853, he was appointed Professor of Natural Philosophy in the Royal Institution, where, as successor to Davy and Faraday, he sustains the reputation of the place for original scientific research. His lectures at the School of Mines have been attended by crowds of workingmen. He is LL.D. of Cambridge, and is a member of a number of the scientific societies of the continent. He was chosen

President of the British Association in 1874. Besides his papers for the Royal Society, T. has written articles in the *Philosophical Magazine* and *The Fortnightly Review*. His separate works comprise *The Glaciers of the Alps; being a Narrative of Excursions and Events* (1860); *Mountaineering in* 1861 (1862); *Heat considered as a Mode of Motion* (2d ed., 1865); *Radiation*, being the Rede Lecture, delivered at Cambridge in 1865; *Lectures on Sound* (1867); a memoir of Professor Farraday (1868); *Fragments of Science*, and *Hours of Exercise in the Alps* (1871); *Six Lectures on Light* (1873); *Address delivered before the British Association in* 1874, *with additions* (1874); *Essays on the Floating Matter of the Air* (1881).

TYNE, a river in the north of England, important from the enormously valuable mineral district through which it flows, and for the flourishing towns that line its banks, is formed by the confluence of two head-waters—the North Tyne and the South Tyne. The North Tyne rises on the Scottish border, 11 miles south-east of Hawick. It flows south across Keelder Moor, and south-east to Hexham, after traversing a district abounding in picturesque villages and gentlemen's seats. Its chief affluent is the Reed, which rises on Carter Fell, and flows south-east past Otterburn to Bellingham, where it joins the larger stream. Near Hexham, the North Tyne is joined by the South Tyne, which rises on the slopes of Cross Fell, 11 miles north of Appleby, in Westmoreland, flows north to Haltwhistle, and thence east to Hexham, through a district crowded with old castles and peel-houses. From the junction of the two head-waters, the T. flows east through the south of Northumberland, which presents charming scenery, and is studded with castles and country seats. At Blaydon—about 8 miles above Newcastle—the navigation begins, and from this point, passing Newcastle (q. v.), Gateshead (q. v.), North Shields (q.v.), and South Shields (q. v.), its banks are lined with foundries, furnaces, docks, wharfs, and quays. Total length 80 miles.—See Guthrie's *River Tyne; its History and Resources*, 1880.

TY'NEMOUTH, a small village and parish of Northumberland, takes its name from the river Tyne, on the north bank of which, and near its mouth, it stands. It is 8 miles east of Newcastle by railway, and its light-house is in lat. 55° 1′ N., long. 1° 25′ W. Though itself only a village, it gives name to a township containing above 21,000 inhabitants. Much of this township, however, is comprised in the town of North Shields (see SHIELDS, NORTH), and counts in the population of that town. It also gives name to a parliamentary and municipal borough, containing (1881) 43,863; but including besides the village of T., the large town of North Shields, and the three villages of Chirton, Preston, and Cullercoats. The village of T. is much frequented as a watering-place by the inhabitants of Newcastle. Its sands, about a mile in length, form an excellent bathing-ground. There are many attractive buildings and institutions, as the castle and fortifications, the fine ruins of a priory and Lady chapel, the Master Mariners' Asylum, &c. The borough of T. sends one member to the House of Commons.

TYPE (Gr. *typos*, an impression or stamp), the name given to the stamps or dies which impress the letters on the paper in Printing (q. v.). Printers, in early times, made the letters which they used, but in process of time the necessity for a division of labor created the distinct business of *type-founding*. There is evidence that, at the beginning of the 16th c., the apparatus for type-founding was much the same as up till near the middle of this century. The first step in the process is the cutting of a punch or die resembling the required letter. The punch is of hardened steel, with the figure of the letter cut, the reverse way, upon its point. On this die being finished, it is struck into a piece of copper about an inch and a quarter long, one-eighth of an inch deep, and of a width proportionate to the size of the type to be cast. This copper being so impressed with the representation of the letter, requires to be adjusted to the mould, so that the 'face' or impression of the punch (in the copper) may be brought into such relation with the metal which forms the 'body' or stalk of the type, that when the types are 'set up' they may stand at the proper distance from each other, and be in 'line' or range, and also square to the page; this work is termed 'justifying,' and the copper is now a 'matrix.' The matrix is now fixed into a small instrument or frame, called the mould, which is composed of two parts. The external surface is of wood, the internal of steel. At the top is a shelving orifice, into which the metal is poured. The space within is of the size of the required body of the letter, and is made exceedingly true. The melted metal, being poured into this space, sinks down to the bottom into the matrix, and instantly cooling, the mould is opened, and the type is cast out by the workman. This process of casting types is executed with great celerity. Of course, every separate letter in the alphabet, every figure, point, or mark, must have its own punch and matrix. In casting types, the founder stands at a table, and has beside him a small furnace and pot with heated metal, which he lifts with a small ladle. *Type-metal* was a compound of lead and regulus of antimony, with a small proportion of tin; but in 1856, a new compound was formed by adding a *large* proportion of tin to the lead and antimony, which considerably increased the cost of the metal, but it doubled its durability. The antimony gives hardness and sharpness of edge to the composition, while the tin gives toughness and tenacity, and removes the brittleness which antimony causes when used largely without tin.

Various attempts were made during the early part of this century to cast type by machinery; but the first successful apparatus for this purpose was the invention of Elihu White of New York, which was modified and repeatedly improved upon by David Bruce, a Scotsman resident in America. The type-casting machine was introduced into Great Britain, and patented by Miller and Richard, of Edinburgh, in 1848. This machine, which requires a man to drive it, produces more than double the quantity that the hand-mould did, while the finish and regularity of the type so cast are much more perfect. Another machine was constructed and patented some years after by the same firm, with the view to apply steam for driving, which was successfully completed in 1860, and is now the most advanced and approved system of casting.

The type-casting machine consists, first, of a small melting-pot, which contains the molten metal, and is placed over a small furnace having an outer case of cast-iron. In the interior of

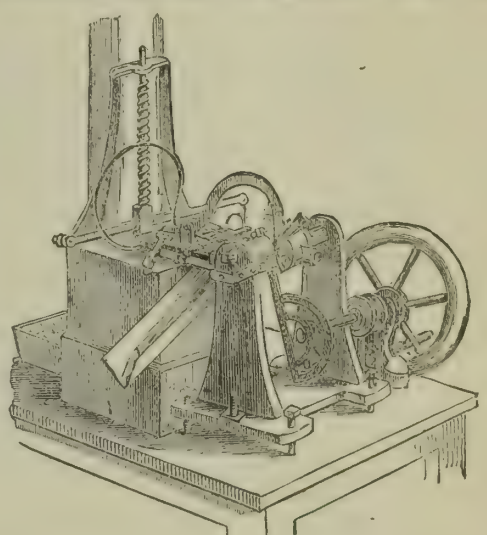


Fig 1.—Type-casting Machine.

the pot is arranged a forcing-pump and valve for admitting the metal under the piston, and also for preventing the return of the metal into the mass in the pot when the piston is depressed, and thus securing the full force exerted upon the piston being transmitted by the piston to the molten metal under it, and forcing it through a narrow channel leading from the bottom of the chamber in which the piston works to the outside of the pot, where a nipple is inserted, with a small hole through it, communicating with this narrow channel. Against this nipple, the mould in which the type is formed is pressed at the moment at which the piston descends, and so receives the molten metal that forms the type.

The second part of the machine is that which carries the mould, and to which the mould is firmly bolted. The mould is similar to the old hand-mould, but modified to suit the machine; it is much stronger; the 'jets' are shorter, and the orifice by which the metal enters is smaller, so that it may be brought exactly coincident with the small hole in the nipple in front of the pot. The mould —as the old hand-mould—is made in halves; the one half being firmly bolted to an arm which, by cams and levers, is made to oscillate, and carry the mould to and from the nipple in front of, and above the pot; the other half of the mould is bolted to another arm, which, by a peculiarly formed hinge, is attached to the first arm, so that the two halves of the mould may be made to open and shut upon each other, like the lid of a snuff-box; and so both sides of the mould oscillate together to and from the nipple in the pot from which they receive the molten metal. The furnace, with the pot and machine carrying the mould, are raised upon cast-iron framing to a height convenient for a man standing to watch the working of the machine. The operation of the machine is as follows: The piston being raised in the chamber of the pump, and the chamber being supplied with metal through the valve, the mould is brought against the nipple; the valve closes, to prevent the metal being forced back into the pot; the piston descends, and forces the metal through the narrow channel into the mould; the mould then recedes from the nipple, and in receding, the two halves separate from each other, and eject the type; the mould

again approaches the nipple, and in approaching, the two halves close together, and are ready for another operation.

A blast of cold air is directed upon each mould, to keep it cool. When the type is cast from the mould, it is in a rough state; and as soon as a heap has accumulated on the caster's table, they are removed by a boy, who breaks off a superfluous tag of metal, or 'jet,' hanging at the end of each type. From the breaking-off boy the types are removed to another place, where a boy rubs or smooths their sides upon a stone. Being now well smoothed, they are next removed to a table, and set up in long lines upon a 'stick;' they are then dressed or finished, and after being examined by a magnifying-glass are ready for use. Whatever be the size of the types, they are all made of a uniform height, and must be perfectly true in their angles, otherwise it would be quite impossible to lock them together. A single irregular type would derange a whole page. The height of type made in this country is $\frac{92}{100}$ds of an inch; those made in France, Spain, and Germany are higher. All the types of one class of any founder are always uniform in size and height; and to preserve their individuality, all the letters, points, &c. belonging to one class are distinguished by one or more notches or nicks on the body of the type, which range evenly when the types are set. These nicks, as we shall immediately see, are also exceedingly useful in guiding the hand of the compositor. Types are likewise all equally grooved in the bottom, to make them stand steadily.

The earliest types used were in the style known as Gothic or Black-letter; which was afterwards superseded, except in Germany, by the Roman letter. See BLACK-LETTER. The varieties of size of types in the present day amount to forty or fifty, enlarging, by a progressive scale, from the minutest used in printing pocket-Bibles, to the largest which is seen in posting-bills on the streets. Printers have a distinct name for each size of letter, and use about sixteen sizes in different descriptions of book-work; the smallest is called *Brilliant*, the next *Diamond*, and then follow in gradation upwards, *Pearl*, *Ruby*, *Nonpareil*, *Emerald*, *Minion*, *Brevier* (the type with which this sheet is printed), *Bourgeois*, *Long Primer*, *Small Pica*, *Pica*, *English*, *Great Primer*, *and Double Pica*. The larger sizes generally take their names thus—*Two-line Pica*, *Two-line English*, *Four*, *Six*, *Eight*, or *Ten line Pica*, &c. Other nations designate many of these sizes by different names. Some of these names were given from the first maker; others from the books first printed with the particular letter. Thus, *Cicero* is the name of a type in France and Germany, with which Cicero's letters were first printed (Rome, 1467); *Pica* is from the service of the mass, termed *Pica* or *Pic; Primer*, from *Primarius*, the Book of Prayers to the Virgin; *Brevier*, from *Breviary; Canon* from the *canons* of the Church, &c.

All kinds of types are sold by weight by the founders, the price varying in amount according to the size of the letter. The smallest size, *Brilliant*, costs about 10*s*. per pound; *Diamond*, about 6*s*. per pound; *Brevier*, about 1*s*. 6*d*.; *English*, 1*s*.; and so on in proportion for all intermediate sizes. Expensive as types thus are, their prices will not appear too high, considering the immense outlay in cutting the punches and the general manufacture. In the *Diamond* size, 2800 go to a single pound-weight of the letter *i*, and of the thinnest *space* about 5000.

A complete assortment of types is called a *Fount*, which may be regulated to any extent. Every type-founder has a scale showing the proportional quantity of each letter required for a fount; and a peculiar scale is required for every language. For the English language, the following is a typefounder's scale for the small letters of a fount of types of a particular size and weight:

a	8500	h	6400	o	8000	v	1200
b	1600	i	8000	p	1700	w	2000
c	3000	j	400	q	500	x	400
d	4400	k	800	r	6200	y	2000
e	12.000	l	4000	s	8000	z	200
f	2500	m	3000	t	9000		
g	1700	n	8000	u	3400		

It will be seen from this scale that the letter *e* is used much more frequently than any other character.

Type-founding originated in Germany along with printing; as early as 1452, P. Schöffer (see GUTENBERG) had substituted types of cast-metal for the original wooden types. The earliest and best punch-cutters were in Nürnberg, which continued for a considerable time to supply the type-founders throughout Germany with punches. Bodoni (b. 1740, d. 1813) in Italy, the Didots (q. v.) in France, and Breitkopf (b. 1719, d. 1794) in Leipzig, are the most distinguished names in the subsequent history of type-making on the continent. The art made little progress in Great Britain from the time of Caxton, and the types used were mostly imported from Holland until about the year 1720, when William Caslon, originally an engraver of ornamental devices, turned his attention to letter-cutting, and soon established such a reputation as not only put a stop to the importation of foreign types, but caused his own to be frequently sent to continental countries.

The foundry established by Caslon in London is still in existence. Baskerville (q. v.) is the next greatest name in the history of the art in England. The types produced by Alexander Wilson of Glasgow became the foundation of the fame of the Foulis (q. v.) as printers. The type-foundry of Miller and Richard in Edinburgh has enjoyed a well-merited reputation for half a century and more.

The large letters used in posting and hand-bills were formerly manufactured chiefly in London and Sheffield, but are made now also in Edinburgh. In this kind of types, very great improvements have also been made in recent times; and the varieties are becoming yearly more numerous and ornamental in character. The letter used in printing in North America is made principally at New York; and the style of both typography and press-work in that country is rapidly improving.

Type-setting, or 'Composing.'—All the types used in printing-offices are sorted in cases, or shallow boxes, with divisions. There are two kinds of cases—the *upper* and *lower case;* the latter lying

Fig. 2.

nearest the compositor upon the frame for their support. The annexed illustration exhibits the arrangement of the cases and position of the compositor—the lower case being immediately under his hand, the upper case directly above in a slanting position, and the under part of the frame stocked with cases of different founts. In the upper case are placed all the capitals, small capitals, accented letters, a few of the points, and characters used as references to notes. In the lower case lie all the small letters, figures, the remainder of the points, and spaces to place betwixt the words. In the lower, no alphabetical arrangement is preserved; each letter has a larger or smaller box allotted to it, according as it is more or less frequently required; and all those letters most in request are placed at the nearest convenient distance to the compositor. By this ingenious and irregular division of the lower case, much time is saved to the compositor, who requires no label to direct him to the spot where lies the particular letter he wants. To a stranger, nothing appears so remarkable as the rapidity with which a compositor does his work; but habit very soon leads the hand rapidly and mechanically to the letter required. When *italic* letters have to be introduced, they are taken from a separate pair of cases of the same fount.

The process of composing and forming types into pages may now be adverted to. Placing the copy or manuscript before him on the upper case, and standing in front of the lower case, the compositor holds in his left hand what is termed a composing-stick. Sometimes this instrument is of wood, with a certain space cut in it of a particular width; but more commonly it is made of iron or brass, with a movable slide, which, by means of a screw, may be regulated to any width of line. In either case, the composing-stick is made perfectly true and square. One by one the compositor lifts and puts the letters of each word and sentence, and the appropriate points, into his stick, securing each with the thumb of his left hand, and placing them side by side from left to right along the line. When he places a letter in the stick, he does not require to look whether he is placing it with the face in its proper position; his object is accomplished by looking at what is called the *nick*, which must be placed outward in his composing-stick. (See adjoining representation of a type.) This is one of those beautiful, and at the same time simple, contrivances for saving labor which experience has introduced into every art, and which are as valuable for diminishing the cost of production as the more elaborate inventions of machinery. When he arrives at the end of his line, the compositor has a task to perform in which the carefulness of the workman is greatly exhibited. The first letter and the last must be at the extremities of the line: there must be no large spaces left in some

Fig. 3.

instances, and crowding in others, as we see in the best manuscript. Each metal type is of a constant thickness, as far as regards that particular size of letter; though all the letters are not of the same thickness. The adjustments, therefore, to complete the line with a word, or at any rate with a syllable, must be made by varying the thickness of the spaces between the words. A good compositor's work is distinguished by uniformity of spacing; he will not allow the words to be very close together in some instances, and with a large gap between them in others, as is evident, for instance, in this sentence.

In composing poetry, or similar matter, where there is always a blank space at one of the ends of the line, spacing is very easily accomplished by filling up the blank with larger spaces, or *quadrats*. But whether prose or poetry, the matter of each line must be equally adjusted and *justified*, so as to correspond in point of compactness with the previously set lines. The process of composing is greatly facilitated by the compositor using a thin slip of brass called a *setting-rule*, which he places in the composing-stick when he begins, and which, on a line being completed, he pulls out, and places upon the front of the line so completed, in order that the types he sets may not come in contact with the types behind them, but glide smoothly into their places to the bottom of the composing-stick.

When the workman has set up as many lines as his composing-stick will conveniently hold, he lifts them out by grasping them with the fingers of each hand, and thus taking them up as if they were a solid piece of metal. He then places the mass in an elongated board, termed a *galley*, which has a ledge on one or perhaps both sides. The facility with which some compositors can lift what is called a *handful* of movable type without deranging a single letter, is very remarkable. This sort of skill can only be attained by practice; and one of the severest mortifications which the printer's apprentice has to endure, is to toil for an hour in picking up about a thousand letters, and then see the fabric destroyed by his own unskilfulness, leaving him to mourn over his heap of broken type, technically denominated *pie*.

Letter by letter, and word by word, is the composing-stick filled; and by the same progression the galley is filled by the contents of successive sticks. When the compositor has set up as many lines as fill a page, he binds them tightly round with cord, and removes them from the galley.

Sometimes, as in the case of newspaper and similar work, the *handfuls* of type are accumulated till they fill the galley, and in that form are prepared for press. After the matter is thus far prepared, it is the duty of the pressman to take an impression or *first proof* from the types, in order that the first-proof *reader* may compare with 'copy,' or MS.; after which it is handed to the compositor, so that he may correct the errors which are sure to have been made. Proofs are usually taken by a press kept for the purpose. After the galley matter is corrected and re-corrected by the compositor, it is divided into pages of the size wanted; and head-lines or figures indicating the number of the page, being added, the pages are arranged upon a large firm table, and there securely fixed up in an iron frame or *chase*, by means of slips of wood and wedges, or *quoins*. The annexed cut is a representation of a small *form*, consisting of four pages of type.

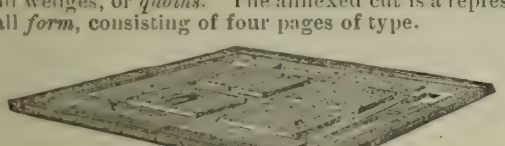

Fig. 4.

This process, which is called *imposing*, being completed, and the face of the types being leveled by a *planer* and mallet, the *form*, as it is called, is proved, and prepared for press. Proof-sheets being taken, they are subjected to the scrutiny of a *reader* employed in this peculiar function in the office, the author himself having previously given effect to his corrections or emendations. When the *reader* has pointed out words and letters to be altered or corrected, the compositor once more goes over the form, correcting the errors by lifting out the letters with a bodkin, and, when revised, the sheet is pronounced ready for printing. The imposing-table at which all these corrections are made is usually composed of smooth stone, or marble, or cast-iron on the top, and requires to be a substantial fabric. See TYPE-SETTING MACHINES.

TYPE-SETTING MACHINES. The first type-composing machine on the records of the English Patent Office appears to be that of Mr. W. Church, and the specification of his patent is dated March 1822. This, after a lapse of twenty years, was followed by a number of others, scarcely a year passing without one or more being made the subject of a patent. Moreover, some of them, among others those of Young and Delcambre, were for a long time before the public For at least half a century, therefore, the construction of a useful type-setting machine has been a problem which a number of ingenious men have tried to solve, but it is only within the last year or two that there has been anything more than the mere appearance of success. If the reader will look carefully at a page of printed matter, he will notice that the spaces between the words are not equal, and he will easily understand that to reduce this inequality to a minimum, requires skill and experience if the work is to go on swiftly. It is in the doing of this, which is called 'justifying,' where a machine fails, because another operator must afterward space the machine-setting into lines of equal length. It is comparatively easy to construct a machine which will, by some mechanical arrangement, drop any required letter from a series of files or reservoirs of types, through a channel which conveys it to a composing-stick—that is, which will set up type, in any required order, but with *exactly equal spaces* between the words; but the difficulty of justifying has not yet been got over. Still, as that operation can be performed by girls at comparatively little cost, there is a decided advantage in favor of the machine.

In the early composing-machine by Church, 'the types are arranged in files in a case at the top, each file being directly over a slit in a horizontal frame. One of a number of jacks protrudes through each of these slits, each jack being connected with a key in a manner somewhat similar to the jacks and keys of a harpsichord.' On the depressing of any particular key, the undermost type of the file is pushed into a race, from which it passes to a composing-stick. It is suprising how closely this description conveys to us the leading idea in most of the type-composing machines invented since 1822. Hattersley's machine, for example, which was patented in 1857, has somewhat analogous movements, but the keys are arranged more like those of a *concertina*, and the details are different. This machine, which occupies a space of about 2 feet by 3, has a horizontal top stage on which is placed a partitioned tray, containing the rows of types running from back to front, each row being of course all the same letter. Descending vertically along the front of this tray is a series of as many wires with pistons as there are rows of types, and these pistons are depressed by the keys acting by bell-cranks, and then return to their first position by means of india-rubber bands or springs. A propeller kept in a state of tension by an india-rubber string is placed in the rear of each row of types, and draws them forward to the piston. When the girl working the machine presses down, say an *e* key, it depresses the *e* piston, which pulls down with it an *e* type, and drops it into a tube or channel which conveys it to what represents the composing-stick, and so on with every other letter, figure, comma, or 'space.' The series of channels converge to a focus or common outlet, through which every type in succession passes to its proper place. Machines on Hattersley's principle, with the details much improved by Mr. Fraser of Edinburgh, are at present in use by a large printing firm there.

With one of these machines a girl can compose from 'copy' at the rate of from 10,000 to 12,000 types per hour, but this rate can hardly be maintained continuously, the strain of such rapid setting being too great for the operator. The types are set in long lines, and require afterwards to be 'justified.' This is done by another girl, who, with the aid of a slip of brass of the desired length of line, forms the matter into pages, spacing out each line as she proceeds.

The want of an efficient distributing machine has hitherto been the great drawback to the adoption of composers, but Mr. Fraser has met this difficulty by constructing a distributer which bids fair to supply the want. It separates the different letters by a series of switches acted upon by keys similar to those of the composing-machine. On the depression of a key, the corresponding switch is opened, and the type guided to its proper compartment in the composing-machine reservoir. Type setting and distributing machines like the above in their plan of working, have been in operation for several years in the *Times* office, one of which was exhibited at South Kensington in 1872. Another composing-machine, by Mr. Mackie of Warrington, deserves notice for the ingenuity shown in its construction. It is much more elaborate than any of those above referred to. The first operation is to perforate slips of stiff paper, which is done by a separate machine. These slips, when perforated, represent the words to be composed, and are then passed to the composing-machine proper. In it the types are placed by hand in a series of boxes above the circumference of a large wheel, which is made to revolve, and at each revolution a certain part, acting in concert with the previously perforated paper, comes in contact with mechanism which releases the desired types at the proper time, and carries them forward to a point, where they are pushed off into lines in the composing-stick.

TYPE, in Theology, an image or representation of some object which is called the antitype. In theological use, it is applied chiefly, although not exclusively, to those prophetic prefigurings of the persons and things of the New Dispensation which are

found in the ritual, and even in the history, of the Old Testament. Under the heads HERMENEUTICS. EXEGESIS, have been explained the different senses of which the literal text of Scripture is considered susceptible. Of one of these, the 'mystical,' the 'typical' sense forms a further subdivision. The word 'type' itself is used as well by the writers of the New Testament (Acts, vii. 43; Romans, v. 14; Philippians, iii. 17) as by the Jewish historians, for instance, Philo, *Opp.* t. i. p. 108; and while St. Paul and other sacred writers speak of the ancient types of things to come, St. Peter completes the parallelism by describing baptism as the antitype of the ark of Noah, 1 Peter, iii. 21. Of the types of the Old Testament, many are directly pointed out as such in their very institution; many also are distinctly applied in the New Testament. There is a large class, however, which more properly fall under the mystical sense of Scripture, and which are called indirect, that is to say, 'adaptive' or 'applied' types. In the application and interpretation of these, many of the Fathers, and especially Augustine and Gregory the Great, are most elaborate and ingenious.

TYPES, CHEMICAL. The idea of referring organic bodies to some simple type or representative, has attracted the attention of many chemists, amongst whom Dumas, Sterry Hunt, Laurent, and Gerhardt, especially deserve notice. As our limited space prevents us from attempting to trace out the history of the theory, we shall confine ourselves to a statement of the outline of the doctrine as laid down by Gerhardt, and now adopted in most recent books on organic chemistry. The four principal types, to which most of the chemical compounds are referred, are the following: (1) The hydrogen or metallic type, $\left.\begin{matrix}H\\H\end{matrix}\right\}$; (2) The hydrochloric acid or chloride type, $\left.\begin{matrix}H\\Cl\end{matrix}\right\}$; (3) The water or oxide type, $\left.\begin{matrix}H\\H\end{matrix}\right\}O_2$; and (4) The ammonia or nitric type $\left.\begin{matrix}H\\H\\H\end{matrix}\right\}N$.

The reason why the equivalents of the hydrogen in the hydrogen type, and of the water in the water type, are doubled, is as follows: an accurate study of the volumetric relations of nearly all organic compounds, shows that their molecules furnish equal volumes of vapor, and that the gaseous volume occupied by each molecule will occupy 4 volumes, if oxygen represent the unit of volume. Taking the volume of oxygen, O, as 1, those of hydrogen, H, and of water, HO, are, as is well known, 2. Hence, to fix the standard of comparison at 4 volumes of oxygen, we must write H_2 or $\left.\begin{matrix}H\\H\end{matrix}\right\}$, or H_2O_2, or $\left.\begin{matrix}H\\H\end{matrix}\right\}O_2$, instead of the apparently simpler forms, H and HO. In the other cases, this modification is unnecessary, as the gaseous volumes of hydrochloric acid (HCl) and ammonia (NH_3) are in accordance with the general laws, and are equal to four standard volumes.

1. The *hydrogen type*, $\left.\begin{matrix}H\\H\end{matrix}\right\}$, includes, according to Gerhardt, the radicals of the alcohols, marsh gas, and the hydrocarbons homologous with it, the aldehyds, &c. Thus, marsh gas (or hydride of methyl), C_4H_4, is written $\left.\begin{matrix}C_4H_3\\H\end{matrix}\right\}$, according to the type-theory, and aldehyd (hydride of acetyl), $C_4H_4O_2$, is written $\left.\begin{matrix}C_4H_3O_2\\H\end{matrix}\right\}$; or both the upper and lower equivalent of hydrogen in the typical formula may be repeated. Thus, acetone or methylide of acetyl, $C_6H_6O_2 = \left.\begin{matrix}C_4H_3O_2\\C_2H_3\end{matrix}\right\}$. Amongst the compounds of inorganic chemistry belonging to this type, Gerhardt places the hydrides, arsenides, and antemonides of the metals.

2. The *hydrochloric acid type*, $\left.\begin{matrix}H\\Cl\end{matrix}\right\}$, is removed by many chemists from the primary or principal types, and is regarded as a derived type from the preceding one, one equivalent of H being here replaced by one of chlorine. It includes the chlorides, fluorides, iodides, bromines, cyanides, the ethers of the hydracids, &c. As examples, we may take chloride of benzoyl, $C_{14}H_5O_2Cl = \left.\begin{matrix}C_{14}H_5O_2\\Cl\end{matrix}\right\}$, hydrochloric ether, $C_4H_5Cl = \left.\begin{matrix}C_4H_5\\Cl\end{matrix}\right\}$, and iodide of ethyl, $C_4H_5I = \left.\begin{matrix}C_4H_5\\I\end{matrix}\right\}$.

3. The *water type*, $\left.\begin{matrix}H\\H\end{matrix}\right\}O_2$, includes the oxides (in which term are embraced acids, bases, and salts), the sulphides, the alcohols, the simple and compound ethers, the monobasic organic acids, &c. The following are a few examples: methyl alcohol or wood-spirit, $C_2H_4O_2 = \left.\begin{matrix}C_2H_3\\H\end{matrix}\right\}O_2$; common alcohol, $C_4H_6O_2 = \left.\begin{matrix}C_4H_5\\H\end{matrix}\right\}O_2$; acetic acid, $C_4H_4O_4 = \left.\begin{matrix}C_4H_3O_2\\H\end{matrix}\right\}O_2$; acetate of potash, $KO,C_4H_3O_3 = \left.\begin{matrix}C_4H_3O_2\\K\end{matrix}\right\}O_2$; acetic ether, $C_4H_8O,C_4H_3O_3 = \left.\begin{matrix}C_4H_3O_2\\C_4H_5\end{matrix}\right\}O_2$; common ether $(C_4H_5O)_2 = \left.\begin{matrix}C_4H_5\\C_4H_5\end{matrix}\right\}O_2$, &c.

4. The *ammonia type*, $\left.\begin{matrix}H\\H\\H\end{matrix}\right\}N$, includes the nitrides and phosphides, the compound ammonias, and the amides; as, for example, ethylamine or ethylia, $C_4H_7N = \left.\begin{matrix}C_4H_5\\H\\H\end{matrix}\right\}N$; trimethylamine or trimethylia, $C_6H_9N = \left.\begin{matrix}C_2H_3\\C_2H_3\\C_2H_3\end{matrix}\right\}N$; benzamide, $C_{14}H_7NO_2 = \left.\begin{matrix}C_{14}H_5O_2\\H\\H\end{matrix}\right\}N$, &c.

Besides these three or four principal types, there are *derived types*, *multiple types*, and *mixed types;* and under one or other of these types, primary and derived, multiple and mixed, all organic compounds can be arranged; and the theory of types leads to the general conclusion, that all organic compounds, or, more strictly speaking, their molecules, may be regarded as molecules of hydrogen, water, ammonia, hydrosulphuric acid, &c., in which the hydrogen is entirely, or in part, replaced by organic radicals.—For further information on this subject, the reader is referred to Odling's *Lectures on Animal Chemistry;* to the second volume of Gorup Besanez, *Lehrbuch der Chemie* (of which the chapter 'On Types' was reprinted separately); and to the other more recent treatises on chemistry, English and foreign.

TY'PHA, a genus of plants, belonging to the natural order *Typhaceæ* of some botanists, which, according to others, is a suborder of *Araceæ*. The *Typhaceæ* all inhabit marshes or ditches. They have nodeless stems, unisexual flowers arranged on a spadix without a spathe, the spadix of the male flowers being situated at the summit of the stem, above that of the female flowers, the perianth consisting of scales or lax hairs, the anthers on long filaments, the fruit dry, consisting of the seed with adherent pericarp. They are found in very different climates, and scattered over the world. Two species of T. are found in Britain, *T. latifolia* and *T. angustifolia*, and are popularly known as CAT'S-TAIL or REEDMACE. *T. latifolia* is the most common. It is sometimes called Bulrush. It grows to the height of five or six feet. The root-stocks are astringent and diuretic, and abound in starch. The young shoots both of this and *T. angustifolia*, a smaller plant, are much eaten by the Cossacks of the Don; and are sometimes used in England under the name of *Cossack Asparagus*. The pollen of T. is inflammable, like that of *Lycopodium*, and is used as a substitute for it. *T. angustifolia* and *T. elephantina* are employed in India for making mats and baskets.

TYPH-FEVER is a term which has sometimes been used to designate continued low fever. The best-marked varieties of this affection are known as typhus and typhoid fevers, which in typical cases are easily distinguished from one another, but not unfrequently so merge into one another that it is difficult to decide whether the disease should be classed as typhus or typhoid fever; and hence the general term typh-fever is a very convenient one in doubtful cases. All the typh-fevers belong nosologically to the miasmatous order of zymotic diseases.

TY'PHON, in Egyptian Mythology, was the Greek name of a son of Seb (Kronos) and Nut (Rhea). The latter gave birth to five children on the last five days of the year; first, Osiris, and Haroeris, then T., and lastly Isis and Nephthys. The Egyptian name of T. was Set, also Suti, and Sutech, and in the earliest times he was a highly venerated god. He often appears on the monuments in the form of a beast, the cunning crocodile, the dreaded hippopotamus, or the obstinate ass, and with yellow hair and long blunted ears. From him the kings of the 19th dynasty, Seti (Sethos, Sethosis, changed by Herodotus, into Sesostris), derive their names. The city of Ombos was a special seat of his worship. In later times, however, either about the close of the 21st dynasty or afterwards, his worship was abandoned, and his figure and name were obliterated from many of the monuments. The cause of this curious religious revolution is unknown, but at any rate, T. came to be regarded as a god hostile to the Egyptians, and was gradually developed into a personification of the principle of Evil—in short, the Egyptian Devil, the opponent of holy doctrine, and adversary of Osiris—the god of the waste howling wilderness, of the salt lakes, of drought and of scorching heat.

The connection between the Egyptian *Set* and the Greek T. is not very easy to trace, but it undoubtedly existed. According to Homer, T. (called also Typhāon) was a huge giant, chained under the earth in the country of the Arimoi, and lashed by the lightnings of Zeus. Hesiod makes him a son of Typhōeus and a hur-

ricane, and, by the snake-goddess, Echidna, the father of the Chimæra, the many-headed dog Orthus, the hundred-headed dragon that guarded the apples of the Hesperides, the Colchian Dragon, the Sphinx, Cerberus, Scylla, Gorgon, the Lernæan Hydra, the Eagle that consumed the liver of Prometheus, and the Nemean Lion. Typhōeus, again, was the youngest son of Tartarus (Hell) and Gæa (Earth), or, as others say, of Hera (Juno) alone. At a later period, the father and son coalesced into one person.

Pindar describes T. as a monster with a hundred dragon-heads, fiery eyes, a black tongue, and a terrible voice. He sought to wrest the sovereignty of the world from Zeus, but after a fearful struggle, he was subdued by a thunderbolt from Olympus, and hurled into Tartarus, or buried under Ætna. The later poets modify the older myth with fabulous additions of their own. They connect T. with Egypt—a proof, perhaps, that he had come to be identified with the Egyptian *Set*. According to Ovid and others, all the gods fled before him into Egypt, and through fear, changed themselves into animals, excepting Zeus and Athene. After an appalling struggle, in the course of which Zeus was once hamstrung, and carried off by the daring monster, T. was vanquished, but not before he had hurled all Mount Hæmus against his adversary, in a paroxysm of supernatural rage. It is very possible that the fierce *physical* opposition of T. (especially when the monster came to be identified with *Set*, the Egyptian Devil) may have had (along with other causes) a material influence in determining that popular conception of 'Satan' which reigned both in patristic and medieval times, and of which Milton has so largely availed himself in his *Paradise Lost*.

TYPHOO'NS (Chinese *Tei-fun*, i. e., 'hot wind;' the word, it need scarcely be said, has no connection with the Typhon of mythology) are violent storms which blow on the coast of Tonquin and China as far north as Ningpo and the south-east coasts of Japan. Varenius, in his *Geographia Naturalis*, describes them as 'storms which rage with such intensity and fury that those who have never seen them can form no conception of them; you would say that heaven and earth wished to return to their original chaos.' They occur from May to November; but it is during the months of July, August, and September that they are most frequent. They resemble the storms of Western Europe (see STORMS) in their general characteristics, with this difference, that the main features are more strongly marked. There is a depression of the barometer, over a space more or less circular in form, accompanying the typhoon, but it is generally more contracted in area, and deeper and more abrupt than in European storms. It is not uncommon for the barometer, at the center of the depression, to read 28·3 inches, and on rare occasions to fall even as low as 27 inches; and the changes of pressure are very rapid, frequently ·2 or ·3 inch in an hour.

It is this enormous difference of atmospheric pressure between neighboring places, and the consequent rapidity of the fluctuation, which give to these storms their terribly destructive energy—the law regulating the strength of the wind being, that it is proportioned to the difference of pressure between the place from which it comes and the place toward which it blows. The low pressure in the center is confined to a very limited space, and since all round this space the pressure is greater, it follows that the level of the sea there will be higher. Hence, a high wave is frequently found to accompany these storms, advancing inland, carrying with it ruin and dismay, and not unfrequently bearing ships far over the level fields, where they are left stranded a considerable distance from the sea.

Typhoons have their origin in the ocean to the east of China, especially about Formosa, Luzon, and the islands immediately to the south. They thence proceed, in four cases out of five, from east-north-east toward west-south-west, more rarely from east-south-east to west-north-west, and scarcely ever from north to south, or from south to north; in other words, their course is generally along the coast of China. The body of the storm advances at the rate of 12 miles an hour and upwards, within which the winds blow often from 80 to 100 miles an hour, whirling round the center of atmospheric depression in a direction contrary to the motion of the hands of a watch, as all storms in the northern hemisphere do. They thus rotate in the direction south, east, north, west; and travel along the coast, so that the coast feels the northern side of the storm, while at a distance from the coast the southern side is alone experienced. The south-west Monsoons (q. v.) prevail in summer over Southern Asia, to the eastward of which are the north-east trade-winds. See WINDS Here, then, are two great aerial currents flowing contiguously, *but in opposite directions*, each highly charged with moisture, especially the south-west current, which they have taken up from the oceans they have traversed. It is highly probable that the typhoons take their origin from these opposing currents, as whirlpools do at the meeting of two sea-currents; and their intensity is aggravated by the large quantity of heat disengaged in the condensation of the vapor of the atmosphere into the deluges of rain which fall during the storm—10 and 12 inches of rain frequently falling in one day.

Much yet remains to be done towards the examination and explanation of this remarkable class of storms, the first and essential step being the establishing of meteorological stations on the Chinese coast, in Japan, in Formosa, and in Luzon.

TY'PHUS AND TY'PHOID FEVERS have so much in common, that, to avoid repetition, we shall discuss them in one article. Until comparatively few years ago, it was generally believed that no definite distinctions could be drawn between the various forms of continued low fever met with in this country. In 1840, Dr. A. P. Stewart, lately one of the physicians to the Middlesex Hospital, pointed out the differences which are now almost universally recognized between typhus and typhoid fevers; but his views received little attention till 1848—1850, when Dr. Jenner,* Physician to her Majesty, published two papers on *The Identity or Non-Identity of Typhus and Typhoid Fevers*, and on *Diseases commonly confounded under the term Continued Fevers*. In these memoirs, Dr. Jenner shows, by evidence which must be satisfactory to every unbiased mind, that typhus and typhoid fevers differ, as Dr. Watson observes, 'notably and constantly in their symptoms and course, in their duration, in their comparative fatality, in the superficial markings which respectively belong to them, and which warrant our classing them amongst the exanthemata, in the internal organic changes with which they are severally attended, and (what is the most important and the most conclusive) in their exciting causes.'—*Lectures on the Principles and Practice of Medicine*, 4th ed., 1857, vol. ii. p. 795. In addition to typhus and typhoid, there is a third well-marked variety of continued fever, known as *Relapsing Fever*, which has been considered in a special article.

Typhus Fever sometimes commences to show itself by certain premonitory symptoms, due to the depressing action of the poison—which, as will presently be seen, is the cause of the disease—upon the nervous system before it begins to affect the circulation. The patient, in these cases, is listless, unwilling to make any bodily or mental exertion, loses appetite, feels wandering pains over the body, is drowsy during the day, and restless at night. More commonly, however, the disease begins suddenly, a shivering fit being the first symptom. Severe headache, especially across the forehead, is another common early symptom. The muscular power rapidly becomes enfeebled, and the patient very soon feels compelled to take to his bed. As in typical cases of the disease, there are three sets of symptoms, each of which occupies about a week, it is convenient to divide the description of continued fever into that of three weekly stages. In the first week, in addition to the symptoms already noticed, the heat of the skin becomes increased, and the pulse, which at first is hard, becomes soft and weak, and more frequent than in health, often now rising to 120, and in severe cases reaching 130 or 140 beats in a minute. According to Dr. Jenner, the pulse in uncomplicated *typhus* gradually rises to maximum, preserves that rate for a variable time, and then slowly falls; while in *typhoid* it rises and falls irregularly. There is considerable thirst; the tongue becomes clammy and dry, and its center is covered with a white fur, which is often mesially divided by a straight brown streak, which is the first step to the blackness of that organ which afterwards ensues. The intelligence is blunted; but on being sharply spoken to, the patient still gives rational answers. As the week advances, the strength is so reduced, that he lies on his back, and is unable to turn about in bed without assistance. In the second week, the pulse becomes more frequent, weaker, and more compressible, and the tongue grows drier and browner. The teeth and lips are invested with dark sordes, consisting of morbid epithelium that had been shed; and the weakness is now so extreme, that the patient sinks down in his bed. His voice becomes very feeble, and in bad cases he cannot swallow, nor can he put out his tongue.

The two most remarkable symptoms of the second week are the delirium which seems to replace the headache, and about the ninth day ensues, and the appearance of the charcteristic eruption. The delirium usually appears on the patient's awakening from sleep. He is inattentive to all that goes on around him, and usually lies still, muttering disjointed sentences, like a man talking in his dreams. Sometimes, however, he is more actively delirious, talking loudly, and trying to leave his bed. He may sometimes be roused by a strange voice, but soon relapses into his previous state. The senses are in a disturbed condition, the patient being commonly deaf, and, in advanced cases, often suffering from *Muscæ Volitantes* (q. v.), which gives rise to attempts to grasp these visionary objects, or to pick them from the bedclothes. This symptom, which is known in medical language under the name of *Floccitatio*, is almost certainly indicative of a fatal result. The characteristic eruption which Dr. Jenner calls the *mulberry rash*, may show itself as early as the fifth day, but most commonly appears at the beginning of the second week, and sometimes a lit-

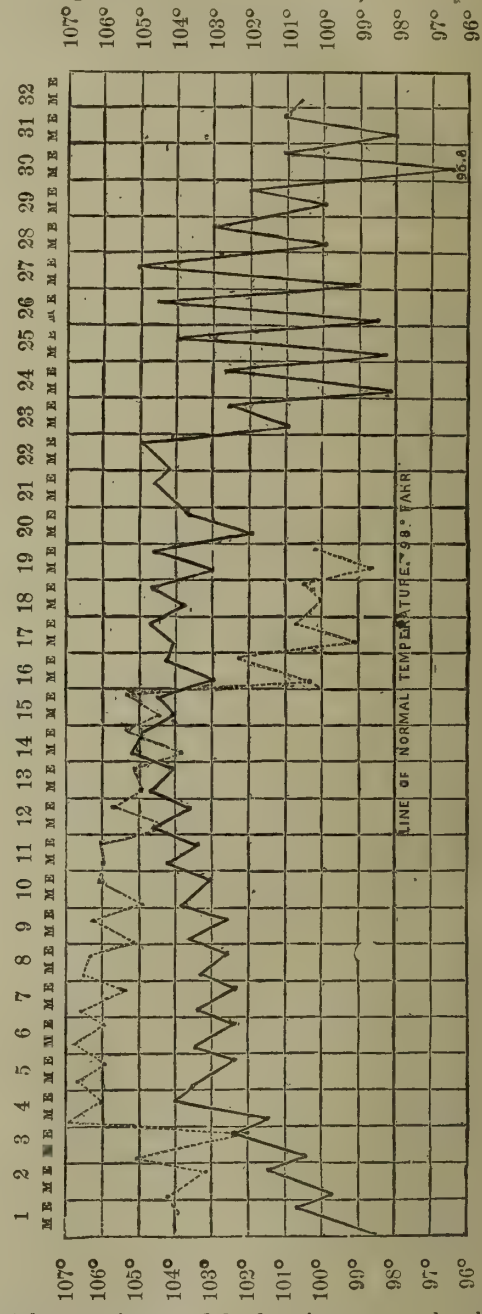
* Now Sir W Jenner, Bart.

tle later. The characters of the rash vary with its age. It consists of very slightly elevated spots of a dusky-pink color. Each spot is flattened on its surface, irregular in outline, with no well-defined margin, but fades insensibly into the hue of the surrounding skin, disappears completely on pressure, and varies in size from a point to three or four lines in diameter. In two or three days, these spots undergo a marked change. They no longer remain elevated above the surrounding cuticle; their hue becomes darker and more dingy than at first, and they now only fade on pressure, instead of completely disappearing. From this state they commonly grow paler, pass into faintly marked reddish-brown stains, and finally disappear. The spots composing this mulberry rash are generally very numerous, close together, and occasionally almost covering the skin. Sometimes, however, they are very few in number, situated at some distance from one another, and not to be distinguished at first from the *rose-spots* which, as will be presently seen, occur in typhoid fever. The mulberry rash is usually situated on the trunk and extremities, but is occasionally limited to the trunk, and in rare cases is seen on the face.

No fresh spots appear after the third day of the eruption, and the rash subsides between the fourteenth and twenty-first days. The mulberry rash, though characteristic of typhus when it occurs, is not an essential symptom of the disease. Dr. Jenner states, that in patients less than 15 years old, in whom the mortality is not more than 2 or 3 per cent., it is mostly either absent, or pale in hue and scanty in quantity; while in persons upwards of 50 years of age, in whom the mortality is about 56 per cent., the rash is always present, and usually dark and abundant. Hence, as in the case of small-pox, the degrees of development of the eruption may be taken as a direct measure of the intensity of the disease. It is in the course of this second week that death is most apt to occur. Amongst 25 fatal cases noted by Jennar, nine deaths only occurred after the 15th day, and not one after the 20th. If the case is going to terminate fatally, symptoms commonly and expressively termed *putrid*, set in; a peculiar fœtor is exhaled from the breath and the surface of the body; the tongue is dry, black, and fissured; the teeth are covered with dark sordes, and sloughing bed-sores occur. The prostration increases to the last degree, and *subsultus tendinum*, or involuntary twitchings of the muscles of the face and arms, make their appearance. In some cases, the ordinary stupor is replaced a day or two before death by the condition known as *coma vigil*. In this condition the patient never sleeps, but lies on his back, with the eyelids widely separated, the eyes staring and fixed in vacuity, the mouth partially open, and the face pale and devoid of expression. He is totally incapable of being roused to give a sign of consciousness, the pulse and breathing are hardly perceptible, and the skin is cool. The occurrence of death is only marked by the eye losing its slight lustre, and the chest ceasing its slow and feeble movements. During the third week, the symptoms gradually abate in those cases which are going to end in recovery. The patient often falls into a profound, quiet, and prolonged sleep between the 14th and 17th day, from which he awakes with a decided general improvement. The complexion is clearer, the delirium has disappeared, the pulse has fallen, and the tongue begins to show signs of moisture at the edges. In a few days, the tongue gradually becomes clean, the appetite becomes ravenous, and from that time the patient rapidly gains strength. In many cases, the amendment is so gradual, that it is impossible to say when it begins; and occasionally the favorable crisis is preceded by a temporary aggravation of the symptoms. A profuse sweat sometimes accompanies the favorable change. In the cases that terminate fatally, there is no rallying from the symptoms described as occurring in the second week.

The fact that the difference between typhus and typhoid fevers was first recognized only a few years ago, affords sufficient evidence that the symptoms of these diseases must be very similar. In describing *Typhoid Fever* it will consequently be sufficient if we indicate the leading points in which it differs from typhus. Amongst the earlier symptoms (although they are sometimes postponed to the end of the first week), the most characteristic are abdominal pains and diarrhœa. These are due to an ulcerated condition of the intestines, which will be presently noticed. The diarrhœa is either spontaneous, or continues after the operation of a purgative. The stools are loose and frequent; and either of a dark color and fœtid, or of a yellow pea-soup-like appearance. The abdomen is found on examination to be unnaturally hard and resisting, tympanitic, and sometimes much distended; its shape, as Dr. Jenner was the first to remark, 'is invariably the same, and somewhat peculiar. Its convexity is from side to side, and not from above downwards. The patient is never pot-bellied, but tub-shaped; the cause probably being that the flatus occupies the colon, ascending, descending, and transverse.' Pressure over the region of the cæcum frequently excites uneasiness, and usually gives rise to a peculiar gurgling movement, which is both audible and palpable, and doubtless arises from the intermixture of liquid and gaseous matters in the bowels. This gurgling is a still more common symptom at a more advanced stage of the disease, and is of the greater importance since it is rarely met with in typhus or any other disorder. An eruption usually appears at from the 8th to the 12th day of the disease. This typhoid rash is very different from that occurring in typhus; it consists of slightly elevated papulæ or pimples, with their heads rounded, and their bases gradually passing into the level of the surrounding cuticle. These papulæ are circular, and of a bright rose color, which fades insensibly into the hue of the surrounding skin. Throughout their whole course, they disappear completely on pressure, and reappear when the pressure is removed. Each papula lasts three or four days, and fresh ones make their appearance every day or two after their first eruption. The number present at a time is usually from six to twenty, but the limits may range from 1 to more than 100.

Their average size is a line in diameter, and they chiefly occur



on the abdomen, chest, and back. As a general rule, no fresh spots occur after the 30th day. The diarrhœa, to which reference has already been made, continues with the progress of the disease, the patient often having from three to six evacuations daily, and often unconsciously passing them in bed. This persistence of the diarrhœa is one of the results of ulceration of the bowels. Another result of this ulceration is the occurrence of hæmorrhage from the bowels, which is one of the most alarming of the symptoms of typhoid fever. It occurs most frequently during the third

and fourth weeks, and varies from a mere stain to a large amount. Sometimes the blood thus poured out by the ulceration of the mesenteric veins is retained in the bowel, and is only discovered after death; the clots being unable to pass through the valve of the cæcum. This hæmorrhage is always an extremely bad symptom, and may either cause immediate death by fainting, or may so weaken the patient as to cause him to succumb to the disease.

The ranges of temperature in typhoid and typhus fever differ very considerably, and although the range in a mild case of either of these diseases differs considerably from the range in severe cases, the foregoing diagram, copied by Dr. Aitken from Wunderlich and Traubeo, shows the typical ranges of temperature in these diseases contrasted throughout their course, from the beginning to the end of the disease. The records indicate morning (M) and evening (E) observations. The *dotted lines* indicate the *Typhus* range, and the *continuous dark lines* indicate the range in *Typhoid*. This diagram is so plain as to require no explanatory details. It is worth while, however, to direct the reader's attention to the rapid changes which in typhoid occur on and after the 22d day, and in typhus about the 15th day. With regard to the duration of the two diseases, Dr. Jenner found that the average duration of *fatal* cases of typhoid was 22 days, and of typhus 14 days; the former disease may terminate *favorably* during the fourth week, and the latter from the 13th to the 17th day.

In cases of recovery from typhoid, a remarkable fatuity remains for a considerable time; a childishness of mind often remaining for more than a month after apparent restoration to health. 'The patient,' says Dr. Aitken, 'generally wakes up, as it were, from the fever, a complete imbecile. The whole man is changed. He seems to have renewed his youth. Childhood and infancy return, and the greatest care is necessary to prevent untoward events. *No man can be considered as fit for work or for general military service for three or four months after an attack of severe typhoid fever.*' —*The Science and Practice of Medicine*, 3d ed., vol. i. p. 382.

Typhoid fever is essentially a disease of childhood and adolescence, the average age at which it occurs being 21¼ years, and it being very rarely that a person aged more than 50 is attacked; while typhus attacks persons of all ages, from early infancy to extreme old age.

The appearances presented on the examination of the body after death are very different in these diseases. While in *typhus* the most common morbid appearances are a fluid condition of the blood; hyperæmia of the cerebral membranes, and increase of inter-cranial fluid; bronchial catarrh and pulmonary congestion, especially at the posterior part of the lungs, which are more or less collapsed; softening of the heart, liver, and spleen, and enlargement of the kidneys: in *typhoid*, there is one constant and characteristic lesion, viz., a morbid condition of the agminated glands (or glands of Peyer) and solitary glands of the small intestine, and especially of the former. These morbid changes may be briefly summed up as follows: thickening, redness, tumefaction, and finally ulceration or sloughing of the glands, the ulceration always occurring in the lower third of the small intestine. On the assumption that the natural office of Peyer's glands is, as Dr. Carpenter suggests, to separate noxious matters from the blood, and to discharge them into the intestinal canal, Dr. C. J. B. Williams suggests that the ulceration so constantly met with in typhoid fever may result from the continued operation of the poison of that disease, thus escaping. When these changes proceed as far as ulceration, the case is one of extreme danger, although death does not necessarily ensue, because the scars left by healed ulcers are often seen when patients, who have had typhoid fever, have subsequently died from some other disease. The existence of these ulcers is, however, likely to prolong the illness after the fever itself has ended; to protract convalescence, and to hinder recovery; and to endanger life, even in cases of apparent convalescence, by causing hæmorrhage or perforation of the bowel. This perforation, which gives rise to intense peritonitis, occurs in about one in five fatal cases, and generally takes place through the ileum near the valve.

We now proceed to notice the origin and mode of propagation of these two diseases, beginning with *typhus*. There is undoubted evidence that all the forms of continued fever are contagious, and it may now be regarded as an established fact, from the investigations of Dr. Jenner, that one species of fever cannot generate another, but that each is produced solely by its like; that typhus, for example, always propagates typhus, and never any other form of fever, as typhoid or relapsing fever. Some persons may, by some peculiarity of constitution, be able to resist the action of the poison, while others are peculiarly susceptible to it. An attack of fever generally exerts a certain amount of protective power against another attack of the same kind of fever; and *habit* has a good deal of power in fortifying the system against contagion, just as confirmed drunkards or opium-eaters can with impunity swallow doses of their respective poisons which would prove highly dangerous to a novice. 'Upon this principle,' says Dr. Watson, 'has been explained the comparative immunity from contagious diseases, under like circumstances of exposure, of medical practitioners and nurses; of the keepers of filthy lodging-houses, while the new-coming inmates suffer; and even of prisoners, who, without having had the disease themselves, may nevertheless carry forth and communicate the infection, as is said to have happened at the celebrated "black assizes" at Oxford, and again at the Old Bailey in the year 1750.'—*Lectures on the Principles and Practice of Physic*, 4th ed. vol. ii. p. 829. Whether typhus can be generated *de novo* by great over-crowding and vitiation of air, by the organic impurities emanating from the respiratory and other functions, is still a disputed question. The conditions essential to its propagation are (1) overcrowding, combined with deficient ventilation; (2) personal filth, and clothes saturated with cutaneous exhalations; and (3) an impaired condition of the system, such as may result from insufficient food, scurvy, and any other debilitating causes. The patient is most dangerous as a focus of infection after the end of the first week to the period of convalescence, the peculiar odor from the skin and lungs being then the strongest. If the poison be very concentrated, the disease may be caught by exposure to it for only a few minutes. The infected person may actually be conscious when the poison is taken in.

Dr. Banks of Dublin, in an excellent lecture which he delivered on 24th April, 1866, in the theater of the Richmond Hospital, 'On the Origin and Classification of Fevers,' states that this happened in his own case, while examining the chest of a person laboring under the disease. 'The patient,' he observes, 'was seized with cough, and I was so placed that I must have inhaled his breath. The odor was peculiar and intolerably offensive. I was certain that I had imbibed the poison; and after a latent period of three days, I exhibited the usual train of symptoms which usher in typhus of the severest form.' The most common latent period is nine days.

From the investigations of various physicians, amongst whom Dr. William Budd deserves especial notice, it appears that the living human body is the soil in which the specific poison of *typhoid* fever breeds and multiplies. The origin of the disease is unknown, but the poison is communicated or contained in the diarrhœal discharges which issue from the diseased intestine. These discharges, as they dry up, preserve the germs of the disease; and if, through atmospheric or other agencies, these germs enter the living body, they communicate the disease, and diarrhœa soon commences. As the evacuations contain the specific virus of typhoid fever, the disease may be propagated amongst healthy persons (1) by percolation through the soil into the wells which supply drinking-water; (2) or by issuing, through defects in the sewers, into the air which is inspired; or (3) by exhalation through the apertures of small ill-trapped water-closets or privies, which are at once the receptacles of the discharges from the sick, and the daily resort of the healthy. Atmosphere thus infected with the poison is far more dangerous than that immediately surrounding a fever-patient.

For a knowledge of the means of checking the spread of typhoid fever, society is deeply indebted to Dr. Budd's researches; and provided these means are thoroughly and efficiently carried out, it is believed by many of the most eminent physicians that the recurrence of this disease might be entirely prevented. In order to judge of the extent of the infection to be destroyed, there are two points to be considered—viz., *first*, the amount and duration of the intestinal discharge in each case, and *secondly*, the number of cases actually occurring. With regard to the first point, the diarrhœa lasts on an average fifteen days. With regard to the second point, the Reports of the Registrar-general show that at least 100,000 to 150,000 cases of typhoid fever occur annually in England alone; or, in Dr. Budd's emphatic words, 'every year in England, more than 100,000 human intestines, diseased in the way already described, continue each, for the space of a fortnight or thereabouts, to discharge upon the ground floods of liquid charged with matters on which the specific poison of a communicable disease has set its most specific mark.' He suggests the following details of procedure, which should be invariably attended to as soon as this disease appears: 1. All discharges from the fever-patient should be received, on their issue from the body, into vessels containing a concentrated solution of chloride of zinc. 2. Two ounces of a caustic solution of chloride of zinc should be put in the night stool on each occasion before it is used by the fever-patient. 3. All tainted bed or body linen should immediately on its removal be placed in water strongly impregnated with the same agent. 4. The water-closet should be flooded several times a day with a strong solution of chloride of zinc; and some chloride of lime should also be placed there, to serve as a source of chlorine in the gaseous form. 5. So long as fever lasts, the water-closet should be used exclusively as a receptacle for the discharges from the sick. For further details as to the various precautions to be taken with a view of checking the spread of this and other epidemic diseases, the reader is referred to Mr. Simon's 'General Memorandum,' published (in 1860) in his *Third Report on the Public Health in England*.

Although typhoid is contagious, Dr. Jenner holds that it is 'infinitely less so than typhus.' Hence in typhus a large room should, if possible, be selected for the patient, and the air should be kept fresh by having a window or a door, or both, open. Curtains, carpets, and all superfluous furniture should be removed, and the body of the patient should be kept as clean as possible by ablution, and his sheets and night-shirt frequently changed; the latter being at once plunged into water containing chloride of zinc. As the susceptibility to the disease diminishes with the advance of life, middle-aged attendants should be selected; and all who approach the sick-bed should avoid as far as possible inhaling the patient's breath or the emanations from his skin. Friends occasionally visiting the patient should do so after a meal and a glass of wine or ale. Formerly it was the practice to distribute cases of typhus fever in the general wards of hospitals—the rule being to distribute them scantily amongst the general patients. This practice came to be looked on as unadvisable; and now each hospital is provided with its fever-house to which cases of typhus are strictly limited.

From a most careful critical study of the history of fever generally, including chemical and microscopical examination of the excretions, Dr. Parkes arrives at the conclusion, that the *general treatment of fever*, including typhus and typhoid fevers, may be summed up 'as being a combination of measures to *reduce excessive heat, to insure proper excretion*, and *to act on the semi-paralysed nerves*.' The special indications for the treatment of *typhus* are: 1. To neutralize the poison, and to correct the morbid state of the blood. Hydrochloric acid is strongly recommended for this purpose; it may be given to the extent of a fluid ounce of the dilute acid daily, mixed with a quart of barley-water sweetened with syrup of ginger, and flavored with lemon peel. 2. To eliminate the poison and the products of the destructive metamorphosis of tissue. For this purpose, alkaline salts may be prescribed to act on the kidneys and skin, and purgatives are often useful. 3. To reduce the temperature.

4. To sustain the vital powers, and to obviate the tendency to death: nourishment in the form of milk and water, coffee, broth, beef-tea, &c., must be administered at least once in every three or four hours, after the fourth day of fever, and alcoholic stimulants are usually serviceable about the seventh or eighth day. Great discrimination is required in prescribing them, and we are mainly indebted to the Dublin school—to Graves and Stokes—for pointing out the importance of the cardiac and radial pulses as guides for the use of alcohol in fevers. When the cardiac impulse becomes weak, and when the first sound of the heart is impaired or absent, stimulants should be freely given; and an irregular, intermitting, abnormally slow, or imperceptible pulse affords a similar indication. 5. To relieve the distressing symptoms, such as the headache, sleeplessness, and delirium; and 6. To avert and subdue local complications.

In *typhoid fever*, the chief indications of treatment are (1) to reduce the temperature, and subdue any vascular excitement that is present in excess; (2) to restrain excessive diarrhœa, for which purpose milk and lime-water in equal parts may be taken as a drink. The discharge ought not to be altogether checked, and Professor Gairdiner prefers giving saline laxatives to astringents, and at the same time recommends that the lower bowels should be unloaded by warm-water injections, to which a little asafœtida or aniseed is added. In cases in which it is doubtful whether to check or encourage diarrhœa, the physician will generally be on the safer side if he discourages the action of the bowels. (3) To stimulate the nervous system by proper food, and possibly by stimulants; (4) to maintain the free action of the kidneys, which is best effected by the administration of small doses of the alkaline carbonates, or of cream of tartar; (5) to influence the elimination of morbid matter from the affected intestinal glands. For this purpose, 1 or 2 grains of calomel should be given twice a day till about the tenth day, but not later. Special symptoms, such as great inflation of the abdomen (known as meteorism), hæmorrhage from the intestines, &c., must be treated by the ordinary rules. Probably the best single remedy for this form of hæmorrhage is oil of turpentine in doses of from 5 to 20 drops every hour or two. It is best administered in the form of an emulsion with gum-arabic, white sugar, and water.

The diet is a subject of the utmost importance from the beginning of the disease till complete recovery ensues. From the various forms of farinaceous food, such as arrow-root, rice, sago, tapioca, bread, &c., from eggs beaten into custard, and milk with or without lime-water (or, preferably, effervescing Carrara water), an abundant, bland, and nourishing dietary can be selected. All animal food, excepting eggs and milk, must be rigidly prohibited. Even beef-tea and mild broths have often been found to exert a special irritant action on the over-charged glands of the ileum. During the period of convalescence, no meat should be allowed till at least a week has elapsed after all the febrile symptoms have vanished, and the only admissible means of opening the bowels are by castor oil or simple enemata.

Both typhus and typhoid fever have been described under various names. Typhus has been popularly known as the jail fever, hospital fever, putrid fever, brain fever, bilious fever, spotted fever, camp fever, &c.; while from the peculiar lesions which are associated with it, the terms enteric fever and intestinal fever have been suggested as appropriate synonyms for typhoid. Its latest name, for which Dr. Murchison is responsible, is pythogenetic fever, or fever born of putrescence. If the term *intestinal fever*, suggested by Dr. W. Budd, were adopted, much confusion would be prevented.*

Had our space permitted, we should have given a brief historical sketch of the principal epidemics of typus fever. To confine ourselves to the present century, it may be mentioned, that during its first fifteen years the ravages of typhus in the armies of Napoleon, and among the population of the countries which were the seat of war, were perfectly appalling. In May 1812, the Bavarian army serving with the French numbered 28,000 men; in February 1813, the number was reduced to 2250, the great destroyer being typhus. In Mayence alone, of 60,000 French troops composing the garrison in 1813—1814, there died of typhus alone, in six months, 25,000 men. During the spring of 1856, more than 17,000 men of the French army in the Crimea perished from this disease in less than three months. According to Parkes, typhus fever occupies the fourth place amongst the causes which have produced loss of life in the British army, the three more potent causes being (1) a defective commissariat; (2) undertaking military operations in an unhealthy site, and with an unhealthy season impending; and (3) exposure to cold, with insufficient clothing and food. The present article, comparatively long as it is, contains but a very meagre outline sketch of the history and treatment of two of the most important diseases affecting the human body.—For further details, the reader is referred to Aitken's *Science and Practice of Medicine*, 3d ed., vol. i. pp. 374—474, and to Dr. Murchison's *Treatise on the Continued Fevers of Great Britain* (1863).

TYR is the old Norse name of a god, who, however, did not belong exclusively to the northern mythology, but was common also to the German, being called in old High German *Ziu* or *Zio*, and in Ang.-Sax. *Tiv*. He was the son of Odin, and was the god of war and of fame, which idea is expressed in old Norse by the word *tyr;* and when the Romans and Greeks speak of a Mars or an Ares among the Germans, it is Tyr that is meant. According to the Edda, he was single-handed. When the Asa-gods persuaded the wolf Fenrir to allow himself to be bound with the bandage Gleipnir, Tyr put his right hand in the wolf's mouth, as a pledge that he would be loosened; and when the gods refused to release him, the wolf bit off Tyr's hand to the wrist, which was called, in consequence, *Ulflithr*, or the Wolf's Joint. In the twilight-battle of the gods, he meets his death at the same time with his enemy, the monster dog, Garmr.

The old Norse Runic character ↑ bore the name of the god. The third day of the week, too, the *Dies Martis* of the Romans, is called after him, in old Norse, *Tyrsdagr;* Ang.-Sax. *Tivesday* (from which our English *Tuesday*); old Friesic, *Tysdei;* old High German, *Ziuwestac;* in the north of Germany, *Tiestac* or *Diestac*, from which the German of the present time, *Dienstag*. Places, and in particular hills and plants, were named after him. The word Tyr appears in epithets of Odin, signifying god in a general sense; as, for example, *Sigtyr*, that is to say, the god of victory; also in epithets of Thor, as *Reidhartyr*, the god of the chariot or of thunder.

TYRANT (Gr. *tyrannos*, Doric for *koiranos*, from *kuros* or *kurios*, a lord or master), a name given in modern times to an arbitrary and oppressive ruler, but originally applied, not necessarily to one that exercised power badly, but merely to one that had obtained it illegally, and therefore equivalent to our word *usurper*. The ancient Greek 'republics,' it must be remembered, were generally aristocratic and even oligarchic in their constitution. When the 'governing families' among the Athenian or Syracusan nobles, for example, quarreled with each other, it was natural, if they could not otherwise agree, that the boldest and most reckless of the set should seek for success by allying himself with the masses of the people, should figure as their champion, promise to redress their wrongs or increase their comforts, and when a fitting occasion presented itself, should, by a clever if somewhat violent stratagem—*coup d'état*, it is now called—deliver them from the domination of his order by himself grasping possession of absolute power, and ruling without any other restraint than the necessity of retaining his popularity imposed—even this limitation being frequently absent when a body-guard of foreign mercenaries rendered it superfluous.

If the political adventurer who thus rose on the ruins of the constitution happened to be a man of sense, and wisdom, and generosity, his 'tyranny' might prove a blessing to a state torn by the animosities of selfish oligarchs, and be the theme of praise in

* Cases of continued low fever, whether typhus or typhoid, are frequently spoken of popularly and vaguely as *gastric* fevers; but the term is not recognized by the medical profession.

after-ages, as was the case with the 'tyrannies' of Peisistratos (q. v.), Gelon (q. v.), Hiero II. (q. v.), and many others; but if he was insolent, rapacious, and cruel, then he sought to reduce the citizens to a worse than Egyptian bondage, and his name became infamous to all time. Such has been the fate of most of the 'Thirty Tyrants of Athens' (q. v.), more particularly of the blood-thirsty Critias, of Alexander of Pheræ, of Dionysius the Younger, &c. It was the method of exercising authority pursued by these and similar usurpers that latterly, even in ancient times, gave the word tyrant that evil significance it has ever since uninterruptedly retained.—See Plasz, *Die Tyrannis bei den Griechen* (Bremen, 1852); Wachsmuth, *Hellen. Alt.*, vol. i. pp. 279—288; and the Histories of Thirlwall and Grote.

TYRANT SHRIKE, the popular name of a section of the Shrike family (*Laniadæ*), connecting that family with the Fly-catchers (*Muscicapidæ*), and entirely American. In the genus *Tyrannus*, the bill is straight, rather long, strong, the upper mandible rounded above, the point suddenly hooked. The birds of this genus are remarkable for their fierce and bold disposition. They are always ready for battle, and often engaged in it. In defence of their young, they rush against any aggressor. The T. S., TYRANT FLYCATCHER, or KING-BIRD (*T. intrepidus*) of North America, has no hesitation in attacking an eagle, rising above him, and pouncing down upon him. This species migrates northwards in summer as far as lat. 57°. It feeds much on the larvæ of insects, but has an unfortunate fondness for bees, and will take its post on a fence or bush near a hive, to dart upon them as they depart or return; on which account it is disliked by American farmers. The true Tyrant Shrikes (*Tyrannus*) have the plumage of white and black, variously blended; but in the genus *Tyrannula*, which approaches more to fly-catchers, the plumage is almost always olive-colored, serving for their concealment among foliage.

TYRCONNEL, RICHARD TALBOT, DUKE AND EARL OF, born early in the 17th century. In his youth, according to Lord Macaulay, he was 'one of the most noted sharpers and bullies of London.' Soon after the Restoration, he endeavored to obtain the favor of the royal family by blackening the reputation of Anne Hyde, so as to furnish the Duke of York with a pretext for breaking his promise of marriage to her. Though unsuccessful in this, he succeeded in gaining the favor of the duke, and contrived to make himself welcome at the palace both as a votary of its pleasures and as a counselor in affairs of state. Immediately on the accession of James II., he was made Earl of T., and put in command of the troops in Ireland; and in 1687, by fawning, bullying, and bribing, he got possession of the office which had long been the object of his ambition—he was appointed Lord-deputy of Ireland. His arrival in that country spread terror and dismay through the English Protestant population, who had already suffered somewhat under his military rule. Events quickly justified their terrors. Nearly every office of dignity in the country was soon transferred to the hands of the Roman Catholics. The Protestant party, so long dominant complained bitterly that they had become a laughing-stock even to their own servants, and that to appeal to law was vain; judgment in every case being given for the native against the Englishmen. But this state of matters did not last long. The revolution of 1688 had a sudden and sobering effect upon the rule of the Lord-deputy; and there can be little doubt that he would have submitted to William III.; but the Irish people threatened that if he dared to sell them for wealth or honor, they would burn the castle and him in it, and put themselves under the protection of France. On the arrival of James in Ireland in 1689, he created the earl Duke of Tyrconnel.

After the fatal battle of the Boyne, at which he held high command, he retired to France. In 1691, he returned to Ireland, with a view to furthering the efforts in favor of James, which were still being made by his adherents. Notwithstanding the defeat of Aghrim (12th July 1691), and the capitulation of Galway, he made preparations for the defence of Limerick, binding himself and his countrymen by an oath not to surrender until they received permission from James, then at Saint Germain. He at the same time despatched a letter in which he stated his conviction that all was lost. On the 11th August, before an answer could arrive, he was struck with apoplexy. He died on the 14th of the same month. He has been characterized by Macaulay as 'the fiercest and most uncompromising of all those who hated the religion and liberties of England.' He was survived until 1730 by his wife—'La belle Jennings' of the court of Charles II. This lady, so famed for her beauty and fascinating manner, entered life as maid of honor to the Duchess of York; in which position she conducted herself with a propriety which, time and place considered, may almost be pronounced unique. As wife of the Duke of T., during his rule in Dublin, her conduct seems to have been characterized both by dignity and purity. It is narrated that when James and her husband, fleeing from the defeat of the Boyne, reached her residence so bespattered with mud as to be scarcely recognizable, she dressed herself richly, and received the fugitive king and his attendants with all the splendor of court etiquette. She died in a small private nunnery in Dublin in circumstances of great poverty.—See Macaulay's *History of England*, vols. ii., iii., and iv.; Chambers's *Book of Days*, vol. i. ed. 1863, p. 310; Mrs. Jameson's *Memoirs of Beauties of the Court of Charles II.*, vol. ii., p. 223.

TYRE, (Phœn. *Sûr* or *Sôr*, rock), a city of ancient Phœnicia situated in lat. 33° 12′ N., which probably derived its name from the double rock on which it was first founded. It was a matter of doubt among the ancients themselves whether T. or Sidon was the older of the two, and the question is one not easily to be settled. So much, however, seems certain, that T. had existed already independently for a long time, when Sidon, defeated by Ascalon, transferred herself almost bodily to the former (see PHŒNICIA). There were two towns of T. closely connected together in historical times; one on the continent, the other on the island opposite, together embracing about 19 Roman miles. The more important of the two was the continental town, called Palæ Tyrus; while the island-town served more or less for the purpose of store-houses, manufactories, arsenals, and the like. The situation of the entire city was one of the most fertile, and its magnificent combination of land and sea scenery formed the theme of many an ancient poet and seer.

Nothing but myths have come down to us respecting the earlier period of its existence. History begins to dawn upon us with Abibal, the predecessor of the biblical Hiram, under whose rule (980—947 B.C.) T. attained to its full glory and renown. An alliance with Solomon was also entered into; trading expeditions were undertaken jointly by the Israelites and the Phœnicians, and Solomon is supposed even to have married Hiram's daughter. During Hiram's reign, T. was much enlarged and embellished; and its two roadsteads and harbors, the wonders of the ancient world, probably date from the same period. He was followed, according to ancient writers, by Balæastartus; after him reigned, for brief periods, his four sons, by the murder of the last of whom the throne became hereditary in the House of Ithobaal, the Ethbaal of Scripture, whose daughter was married to Ahab. T. then appears to have gained the supremacy over Sidon, and also spread her colonies far and wide.

Shortly after the death of this king, Carthage was refounded by Elissa (Dido), about 813 B.C., in consequence of a popular demonstration, which deprived her of the throne in favor of Pygmalion. This 'new city' gradually diminished the importance of the old one; at least T. seems to have been weakened to such an extent by the emigration of its best elements, that it disappears from history until the three great powers, Chaldæa, Assyria, and Egypt, by turns endeavored to make themselves masters of the Tyro-Phœnician coast, with its eastern and western trade. Shalmaneser, king of Assyria, reduced T., after a long siege; and the whole of Phœnicia, the most important places of which had already thrown off their allegiance to T., was rendered tributary to Assyria. During the Chaldæo-Egyptian struggle, T., again at the head of the country, sided with Egypt, and was conquered by the Chaldæans. Once more the Phœnicians attempted to throw off the foreign yoke, and Nebuchadnezzar marched against them at the head of his armies. Having taken Jerusalem (587 B.C.), he reduced the whole sea-coast, except T., which stood a thirteen years' siege by water and by land, ending, not in subjection, but only in a kind of apparent submission, leaving the native sovereigns on their thrones, and their wealth and power untouched. In 538 B.C., Cyrus became master of Phœnicia, which at that time again stood under Babylonian supremacy, and the hegemony was bestowed upon Sidon. For a long time, Phœnicia prospered under wise Persian rulers; but when Xerxes, in his Greek wars, had completely destroyed the Phœnician fleet, and exhausted nearly all her resources, the exasperated inhabitants rose once more, but only to be utterly crushed. Sidon, at the head of the revolution, was fired by its own inhabitants, and once more T. resumed the lead (350 B.C.). Having refused to pay allegiance to Alexander the Great (after the battle at Issus), it was besieged by him in 332 B.C., and fell after a seven months' hard resistance.

Alexander replaced the old inhabitants by new colonists, chiefly Carians, and though the city had sustained all but complete destruction, it yet rose again after a very brief period to wealth and power, and already in 315 B.C., was able to hold out for 18 months against Antigonus. Under the Romans, Cleopatra received T. as a present from Antony; but the last trace of its independent existence was taken from it by Augustus. A Christian community was founded there at an earlier period. The trade and manufacture of T., aided by her exceptionally favorable naval position, insured for it, even under Roman dominion, a high place among its sister cities; and once more, in 193 A.D., it even took an active part in the contest between Septimius Severus and Pescennius Niger, which, resulting in the success of the former, brought back to it some of its ancient distinction. In

St. Jerome's time, it was again the noblest and most beautiful city of Phœnicia, nay, one of the most prosperous and noble cities of the whole East. In the 7th c., it came under the dominion of the Saracens, and so remained until taken by the Crusaders; and in 1192 A.D., became the northern boundary of Christian territory in Palestine. It continued to flourish—still chiefly through its world-renowned purple—until 1516 A.D., when the conquest of Selim I., together with the newly discovered route to Asia by the Cape of Good Hope, put an end to its wealth and commerce, and almost to its existence. Although there has been a slight improvement in its prospects of late, the desolation and wretchedness of that once magnificent city are still most striking. From 3000 to 4000 inhabitants now dwell among the ruins of its ancient glory, finding scanty livelihood in insignificant exports of tobacco, cotton, wool, and wood. Frederick Barbarossa and Origen are both buried here.

TY'RNAU (Magyar *Nagy-Szombath*), a town of Hungary, county of Ober-Neutra, on the river Trna, about 30 miles northeast of Presburg. It has so many churches and convents that it has been nicknamed 'Little Rome.' T. carries on manufactures of cloth, linen, woad, &c., and has a tolerably lively general trade, especially in wine. From 1635 to 1774, it possessed a university, which in the latter year was transferred to Pesth. T. is likewise famous for a huge cask, which can hold twice as much as the Heidelberg one. Pop. (1880) 10,824,

TYRO'L (in German more commonly spelt *Tirol;* not spoken of as *das T.*, though usually called in England *The T.*) forms with Vorarlberg the most westerly province of the Austro-Hungarian monarchy, and borders N., W., and S. on Bavaria, Switzerland, and Italy. Area, including Vorarlberg, 11,280 square miles; pop. in 1880, 912,549.

Surface.—The T. may be regarded as an eastern continuation of Switzerland. It is traversed from east to west by the great chain of the Alps, and is encircled on all sides by lofty ranges. It consists, however, almost entirely of three great valleys—(1) one running east and west north of the Great Alps, and drained by the Ine; (2) one south of the Alps, also running east and west, and drained by upper tributaries of the Adige or Etsch; (3) one running south from the middle of the last, and drained by the main stream of the Adige. These valleys are surrounded by a circuit of mountains. The northern valley is separated from Bavaria by the Algau Alps. The southern valley is bounded on the E. by the Trent Alps; on the W. by the Ortler Alps, which, like protecting walls, run south into the plain of Lombardy. The main chain is crossed towards the center of the T. by a deep depression, in which lies the Brenner Pass (elevation, 4657 feet). It is the lowest of the great passes of the Alps, and that over which runs the great commercial route connecting Italy and Germany.

The dialect and manners of the Bavarians prevail in the northern and middle valley. The dialect and manners of Lombardy, on the other hand, have crept up the third valley to a boundary-line which rests upon the mountains which bound the middle valley on the south. Hence the most important divisions of the T. are into the German Tyrol and the Italian Tyrol. The German T. is divided into (1) the Oberinnthal, or the Upper Inn Valley; (2) the Unterinnthal, or the Lower Inn Valley; (3) the Vintschgau; (4) the Etsch district; and (5) the Pusterthal, the three last belonging to the middle valley of the Tyrol. Beyond the geographical limits of the T., the Austrian province of the T. includes (6) the Vorarlberg, a district drained by streams which fall into the Lake of Constance, and in which a dialect is spoken resembling those of German Switzerland; and (7) the Lienz district, on the Drave, in which the language of the people is Austrian. The Italian T. is divided into (1) a northern valley, or that of Trent; (2) a southern valley, or that of Roveredo; (3) the valley of the Sarca, or district of Riva, on Lake Garda.

Geology and Soils.—The rocks of the T. are chiefly crystalline Silurian and Secondary, with obtruding granites and traps. The chief mineral products are iron, rock-salt, worked near Innsbruck, and marble, quarried in the south. The Tertiary strata of the Swiss and Swabian plains are totally wanting; and it is only along the water-courses that level tracts of recent formation are found. These tracts are the only parts of the country admitting of cultivation by the plough, and they very seldom attain a width of more than half a mile. Taken altogether, they do not form more than one-tenth of the whole country.

Climate.—The loftiest mountains of the T. are in the main chain of the Alps—the Gross Glockner (12.776 feet), east of the Brenner Pass, and Mount Gebatsch (12.276 feet) west of it, and, in the Ortler chain, the Ortler Spitz (12,818 feet). These mountains are covered with vast glaciers, which descend, like those of Switzerland, far into the valleys. Between 6000 and 5000 feet, snow disappears in summer, and alpine plants and grass cover the hills, diversified here and there with stunted bushes. Into this region the herds are driven, as in Switzerland, during the summer months. Below 5000 feet, the fir-woods abound; potatoes and a few vegetables are cultivated, and houses permanently occupied make their appearance. The beech replaces the fir at 4000 feet, and agriculture begins, the chief grains being rye and barley. Wheat is not cultivated with success at a higher elevation than 2000 feet. In the lower part of the southern valley, the temperature is highest, and indeed the climate is that of Northern Italy; tobacco, the fig, the olive, and the mulberry being enumerated among the chief objects of cultivation. Out of every 100 acres of the T., 30 are inaccessible mountain-tracts, 40 forests, 20 commons and meadows, and 10 corn-fields and gardens.

Industry.—The industry of the T. is not important. There are, however, glass and paper factories near Innsbruck; and carpets, linens, gloves, and straw-hats are manufactured extensively for home consumption. Wooden ware is also largely produced. The rearing of canaries is a business which was long a monopoly of the northern Tyrolese, who supplied all Europe with these birds. The exports from the T. consist of cattle, cheese, timber, wine, tobacco, silk, iron, and salt. The imports are grain and manufactured goods. The transit-trade between Italy and Germany gives employment to a large number of the inhabitants. Thousands migrate annually into neighboring countries, to sell their wood-wares, gloves, and carpets. Railways have for a number of years connected Innsbruck with Munich, and Botzen with Verona; and in 1867 the section between Innsbruck and Botzen, over the Brenner Pass, was opened, which completed the first railway communication between Italy and Germany.

Inhabitants.—The northern or German Tyrolese bear to the southern, or Italian, the proportion of three to two; and the habits and language of the people resemble those of the adjoining parts of Italy and Germany. In the T., according to the census, the inhabitants are all Catholic, with the exception of 358 Jews, 1235 Protestants, 29 Greek Christians, and a few members of other sects. The Tyrolese have an independent national diet, meeting at Innsbruck, in which are represented all classes of the population, the clergy, the nobility, the people of the country, and those of the towns. There are, to some extent, separate administrative arrangements for the Italian districts. Education is now very generally diffused, and one of the nine Austrian universities is at Innsbruck.

History.—The history of the T. is partly German and partly Italian. In early times, the T. formed part of Rhætia, and was conquered by the Romans, 15 B.C. Subsequently it was overrun by various German tribes; still later the southern valley fell to the share of the Lombards, the two northern valleys to the Bavarians. The latter valleys were divided into *gaus*, which ultimately became petty lordships, acknowledging the supremacy of the dukes of Bavaria. These lordships, however, in the course of time, came to be represented by two families who intermarried. Then the whole German T. was governed by one family of counts, whose paternal abode was the mountain fortress of Terioli, or Tyrol, near Meran. The last count, who died in 1335, left one daughter, Margaret Maultasche. She bequeathed her rights to her cousins, the dukes of Austria, who, in consequence, acquired possession of the T. in 1363. The Italian valley formed the bishopric of Trent. During the wars of Napoleon, the German T. was ceded to Bavaria, much to the discontent of the population, who were warmly attached to the House of Austria. They made a gallant resistance to the French in 1809, under Andreas Hofer, but were defeated; and the Northern T. was not restored to Austria until the treaty of Paris in 1814. The Southern T., which had been annexed to Italy, was restored to Austria in the following year. An application was made by the inhabitants of the Italian T., a few years ago, to the Austrian government to be rendered entirely independent of the German inhabitants of the northern valleys; but it led to no important change in the administration. It showed, however, the desire of the Southern Tyrolese to be considered Italians rather than Germans, and it was believed that on the event of a successful war for the recovery of Venice, the whole of the Southern T. would be handed over to the kingdom of Italy. This expectation has not been realized. By the treaty of peace between Austria and Italy, at the conclusion of the war through which Venetia again became Italian, it is declared that the frontiers of the Venetian provinces ceded to Italy are the administrative frontiers of these provinces under the Austrian rule. Even the shores of Lake Garda remain Austrian. How long this arrangement will last, it is hard to predict.

The trade of the Southern T. is entirely with the south, its wood and cattle being exchanged for the corn of Lombardy. Of late there has repeatedly been an agitation in Italy with the view of securing the incorporation with the kingdom of what is called *Italia Irredenta* ('Unredeemed Italy'), which includes, with Trieste and part of the Dalmatian seaboard, the *Trentino* and Southern Tyrol.

TYRO'NE (*Tir-owen*, 'Owen's country'), an inland county of Ulster, Ireland, bounded N. by Londonderry, E. by Armagh and

Lough Neagh, S. by Monaghan and Fermanagh, and W. by the last-named county and Donegal. A portion of Lough Neagh is assigned by the Ordnance Survey to this county; and, including this portion, the whole area is 1260 sq. m., or 806,640 acres, of which 450,286 are arable, 311,867 uncultivated, 31,796 under water, 11,981 in plantations, and 710 in towns. Of the arable land, about 260,000 acres are usually under the various kinds of crops. The pop. in 1861 was 238,500; in 1871 it had decreased to 215,766, of whom 119,937 were Roman Catholics, 49,201 Protestants of the Anglican Church, 42,156 Presbyterians; pop. in 1881, 197,719. The surface, in general, is hilly, and often extremely picturesque, this county lying for the most part between the two great mountainous districts which traverse Ulster from east to west. With the exception of Lough Neagh, the lakes, which are numerous, are small. The principal rivers are the Blackwater, the Camowen, and the Ballinderry, of which the former two are navigable.

The county is traversed by railways, which connect it with Dublin, Belfast, and the sea-coast at Dundalk. The geological structure is very much diversified. The north-western mountains are chiefly mica-slate, with primitive limestone, and rise in Slieve Sawel to a height of 2236 feet. Those on the north-east are of greenstone, with granite and occasional red sandstone. The plain, of which Omagh is the center, is a Tertiary formation, with irregular beds of lignite, red marl, and new red sandstone; and between Dungannon and Stewartstown there is a small coal-field, the produce of which is rich, and resembles the coal of Ayrshire. The rest of the plain belongs to the general limestone district. The climate is moist, and the low lands are often flooded. The soil of the plain is a fertile loam; that of the hilly districts, sandy or gravelly. There is a large proportion of bog, the turf of which supplies the chief part of the fuel consumed by the population.

The chief towns are Omagh, Strabane, Dungannon, Cookstown, Aughnacloy, Castlederg, and Clogher, which gives its name to the episcopal see. T. returns three members to the imperial parliament, two for the county, and one for the borough of Dungannon.

T. was anciently known as the district of Hy-Briun and Hy-Fiachra; and in later Celtic times was called Kinel Eogain, or Tir-owen, whence its modern name. See ULSTER.

TYRRHE'NIAN SEA (anc. *Tyrrhenum Mare*), that part of the Mediterranean Sea (q. v.) between the islands of Corsica, Sardinia, and Sicily on the west, and the Italian peninsula on the east.

TYRTÆ'US, famed for his political elegies and marching-songs, was the son of Archembrotus, of Aphidnæ, in Attica; according to another conjecture, he was a Lacedæmonian; while the story which represents him as a lame schoolmaster, of mean family, whom the Athenians (ignorant of his lyric power, and jealous of Lacedæmonian domination in the Peloponnesus) sent to the Lacedæmonians, during the second Messenian war, as the most inefficient commander they could select, must be received as a fiction of later times. He rendered, however, to the Lacedæmonians a kind of assistance which the Athenians little foresaw; and while by his elegies he stilled their dissensions at home, by his war-lyrics, he so animated their courage in the field, that they were finally triumphant in their conflict with the Messenians, whom they reduced to the condition of Helots. This success of his poems T. lived to see, and must accordingly have flourished down to 668 B.C., the last year of the second Messenian war. The best edition of the text of T. is that of Bergk in his *Poetæ Lyrici Græci*.

TY'TLER, WILLIAM, the author of several literary works of considerable merit, the principal being an *Inquiry, Critical and Historical, into the Evidence against Mary Queen of Scots*, in which it is attempted to vindicate that unhappy princess from the charges brought against her by Robertson and Hume. T. was born at Edinburgh in 1711, educated in Edinburgh, admitted a member of the Society of Writers to the Signet in 1742, and died in 1792. He was father of Alexander Fraser Tytler, Lord Woodhouselee, and grandfather of Patrick Fraser Tytler the historian. T. was an accomplished musician, and distinguished for his general culture and taste in the fine arts.

TYTLER, ALEXANDER FRAZER, a historical writer, and a judge of the Court of Session in Scotland under the title of Lord Woodhouselee. He was the eldest son of William Tytler (q.v.), the vindicator of Queen Mary, and was born at Edinburgh in 1747, educated principally in Edinburgh, and admitted to the Scottish bar in 1770. He obtained, in 1780, the professorship of History in the university of Edinburgh; in 1790, the office of Judge-admiral of Scotland; and in 1802, was raised to the bench of the Court of Session. His acquirements were of the most varied kind, embracing most departments of literature and the fine arts. His writings include a biography of Henry Home, Lord Kames; a Dictionary of Decisions of the Court of Session; and the work by which he is best known, his *Elements of General History*, first published in 1801, which has been translated into most of the languages of Europe, and even into Hindustani. He died in 1813.

TYTLER, PATRICK FRASER, an eminent historical writer, fourth son of Alexander Frazer Tytler, Lord Woodhouselee. He was born in 1791, educated partly in Edinburgh, partly in England, and called to the Scottish bar in 1813. Of his various literary and historical works, the most valuable is his *History of Scotland*, beginning at the accession of Alexander III., and terminating at the union of the crowns, a book of more critical research than any work on the same subject that had preceded it. His writings also include a life of the Admiral Crichton, a life of Wickliffe, a memoir of Sir Thomas Craig, and a collection of original letters, illustrative of the reigns of Edward VI. and Mary. In consideration of his merits as a historian, Sir Robert Peel's government conferred on him a pension of £200 a year. He died at Malvern, 24th December 1849. His talents were such as qualified him in a remarkable degree to shine in society, and his amiable and excellent private character have been the subject of deserved eulogy.—See Burgon's *Life of Patrick Frazer Tytler* (1859).

TZETZES, JOHANNES, a Byzantine (Greek) author, flourished during the latter half of the 12th c., is known as the author of certain works in prose and verse, which, though excessively dull, and without a vestige of literary genius, are valuable as storehouses of classical information, not elsewhere to be had. The principal are—1. *Iliaca*, consisting of three distinct poems, entitled *Ante-Homerica*, *Homerica*, and *Post-Homerica;* or in Greek, *Ta pro Homerou*, *ta Homerou*, *kai ta meth' Homeron;* a complete edition of which was first published by Fr. Jacobs (Leip. 1793), but the most critical edition is that of Bekker (Berl. 1816); 2. *Biblos Istorike*, more commonly called *Chiliades*, or a collection of more than 600 stories, mythical, legendary, &c.; best edition that of Kiessling (Leip. 1826), written in that worthless sort of verse, called *political*, which had regard only to syllables, and not to quantity; besides commentaries on Homer, Hesiod, and the *Cassandra* of Lycophron. Several poems and commentaries of T. exist in MS. that have never yet been published.—T. had a brother, ISAAC, who probably had some share in the commentary on the *Cassandra*.

U.

THE twenty-first letter of the English alphabet, represents in that language three distinct sounds, as heard in *tube*, *tub*, and *full*. The last is its primitive sound, which it had in Latin, and which it has preserved in German and Italian, but which is oftener denoted in English by *oo*. In *tube*, it does not mark a pure vowel sound; it is aspirated, as if *y* were prefixed—*tyub*. The sound heard in *tub* is characteristic of English; and, owing, perhaps, to the decided emphasis given to one syllable of a word at the expense of the rest, there is a tendency to allow the other vowels, *a*, *e*, *o*, when unaccented, to degenerate into this indistinct, stifled sound: *cavalry*, *sister*, *fashion* are pronounced almost, if not altogether, as if written *cavulry*, *sistur*, *fashun*. This is especially the case with *o*; and in this vowel the degeneracy is not confined to unaccented syllables; in a whole host of words, the accented *o* is exactly equivalent to *u*—e. g., *come*, *money*, *among*.

Perhaps a similar tendency in Latin may account for the prevalence of *u* in that language as compared with Greek—e. g., Lat. *genus* = Gr. *genos*; *volumus* = *boulometha*; *spatula* = *spatale*; *scopulus* = *skopelos*. *U*, in Latin, sometimes goes into the still thinner sound of *i*; thus *maxumus*, *caputis*, degenerated into *maximus*, *capitis*. Of the labial series of vowels (see LETTERS), *u* approaches nearest to the labial consonants; so much so,

that in Latin the vowel *u* and the consonant *v* were both denoted by the same character, *v*, of which *u* is only a later modification. In the middle ages, the two characters were used indifferently whether as vowel or consonant; and it was only in the 16th c. that the Dutch scholars fixed the use of the character *u* for the vowel, as distinct from *v*.

UBE'DA, a town of Spain, Andalusia, in the modern province of Jaen, stands on an olive-clad slope in a cultivated plain, 26 miles north-east of the town of Jaen. It contains some fine specimens of architecture, of which the chief is the cathedral. It was built by the Moors, and under them it is said to have contained 70,000 inhabitants. There are now only about 18,000, who are engaged in agriculture, in the manufacture of porous vessels, made of red and white clay, and in trade in the products of the fertile vicinity.

UCAY'ALI, a great river of South America, one of the chief head-waters of the Amazon. It joins the Amazon from the south, in south latitude 4° 40′, and west longitude 73° 30′, opposite the town of Nauta in Ecuador; but the whole course of the river is in Peru. It is the largest river that joins the Amazon above the Brazilian territory, and on account of its length, has been regarded by some as the main stream of the Amazon, but at its mouth it is not above half the width of the Amazon. The Maranon and Huallaga from the south, with many smaller but still large rivers from the north, have united to form the Amazon. The sources of the U. are in the Andes, Cuzco being situated on one of its feeders, which rises considerably further south; whilst another has its rise on the western side of the Andes, to the north-west of Lima, and after flowing southward for about 150 miles, makes its way through a cross valley, and takes a northward course.

Attention has of late been very strongly directed to the U. as affording means of communication between the western parts of Peru and the Atlantic Ocean. It was partially explored by the Count de Castelnau and others in 1846, by Lieutenant Herndon and Mr. Gibbon of the United States navy in 1851, and more recently by an expedition sent out by the Peruvian government. It has been found to be navigable by steamers from its mouth to towns not far distant from Lima, 3700 miles from the mouth of the Amazon. On the branch which comes from Cuzco, there are falls and rapids, which form an impediment to navigation more than 100 miles below that city. The course of the U. is winding, but generally northward. Without regard to any but its principal windings, the length of its course is not less than 1100 miles. It receives many large branches. The name U. is not given to any of its head-waters, the chief of which is the Tambo, formed by the junction of the Mantaro, a river which has its sources to the north-west of Lima, and the Apurimac, which comes from a more southern region. The greater part of the country through which the U. flows is covered with forest; but it seems very suitable for colonization, if easy communication with the rest of the world were established, the soil being fertile, whilst the mountains abound in valuable minerals.

U'DAL RIGHT, in the Law of Scotland, means that right in land which may be completed without charter and sasine by undisturbed possession provable by witnesses before an inquest. Though dependent on the crown as superior, the vassal pays only a tribute called skat. The right is said to have been the old tenure prevalent in Britain before the feudal system was introduced, and prevails chiefly in Orkney and Shetland. The lands held on udal right are now commonly converted into feus.

UDI'NÉ, a city of N. Italy, Venetia, in the province of the same name, formerly called also the province of Friuli, situated in a fertile plain, about 75 miles north-east of Venice by railway. It is a walled town, 4 miles in circumference, with wide, handsome streets and squares. The castle, which stands on a hill in the midst of the city, was formerly the residence of the patriarchs of Aquileia and is now the seat of the tribunals. The Antonini Palace is a work of the architect Palladius. U. trades in silk, in copper utensils, and rosolio. There are leather, paper, and silk factories. Pop. (1881) 32,020. Two miles from U. stands the village of Campoformio, where, in 1797, the treaty between Bonaparte and Austria was signed, by which Venice was ceded to the latter. Pop. of prov. (1881) 501,649.

U'FA, a government of Russia, formed in 1865 out of the five north-western districts of Orenburg, and separated from the present government of Orenburg by the south-west branch of the Ural Mountains. Pop. (1880) 1,648,753. See ORENBURG.

UFA, capital of the government of the same name, on the right bank of the Biélaia, or White River. It was built in 1573, in the reign of Ivan IV. It contains 12 churches and 24 manufactories, the principal articles of trade being honey, wax, fat, furs, and skins. The Biélaia, an affluent of the Kama, and thus connected with the Volga, is here navigable for large ships. Pop. (1880) 20,917.

UGANDA, an African empire extending along the north-west shore of the Victoria Nianza; the name of its late king, Mtesa, has become well known through Stanley and other recent travelers. The people of U. proper are estimated at 500,000; with subject tribes, perhaps 2,000,000.

UGLI'TCH, a town of Great Russia, in the government of Jaroslav, on the right bank of the Volga, 488 miles south-east of St. Petersburg. In early times it was the chief town of an independent principality. In 1592, most of the inhabitants were banished, and the town, formerly prosperous, became deserted. Linen, weaving, and tanning are the principal branches of industry. Pop. (1880) 13,100.

UGOLI'NO DELLA GHERARDESCA, COUNT, an Italian nobleman of the 12th century, chiefly known for his cruel death, which Dante has immortalized in his *Inferno*. U. was for a time the head of the party of the Guelphs at Pisa, but a conspiracy, led by Archbishop Ubaldini, a Ghibeline leader, was formed against him, and with his sons and grandsons he was cast into the tower of Gualandi, and left to perish miserably by starvation.

UHLAND, JOH. LUDWIG, a celebrated German poet, was born at Tübingen, 26th April 1787, and studied at the university of his native city. He began to publish ballads and other lyrics in various periodicals, the first collection of which, under the title of *Gedichte*, appeared in 1815. To this he kept adding all the rest of his life, and it is on these *Gedichte* that his fame rests. Their popularity has been, and continues to be as great as it is merited, upwards of a dozen editions having been published. Other productions of U.'s are his admirable essays, *Ueber Walther von der Vogelweide* (Stuttg. 1822), and *Ueber den Mythus der nord. Sagenlehre vom Thor* (Stuttg. 1836), a masterly collection of old popular songs, *Alter hoch und niederdeutscher Volkslieder* (Stuttg. 1844—1845); and two dramas, *Herzog Ernst von Schwaben* (Heidelb. 1817), and *Ludwig der Baier* (Berl. 1819). He died at Tübingen, 13th November 1862. U. was a patriotic politician as well as a poet. He entered the representative assembly of Würtemberg in 1819 as deputy from Tübingen, and proved an active member of the liberal party. He was also a delegate to the Frankfürt Assembly of 1848; but though Germany has reason to be grateful for his services to the cause of constitutional liberty, it is as a poet he will be best remembered. His pieces are full of spirit, imagination, and truth, finely picturesque in their sketches of nature, and exquisite in their varied tones of feeling. Nothing, indeed, can surpass the brevity, vigor, and suggestive beauty of his ballads, in which a romantic sweetness of sentiment and a classic purity of style are happily combined. U. is the acknowledged head of the 'Suabian School' of German poets. See Pfizer's *Uhland und Rückert* (Stutt. 1837), and Mayer's *U.* (1867). Longfellow has translated some of U.'s ballads, in his *Hyperion*, into English; and translations by Platt, Skeat, and Sanders have also appeared.

U'HLANS (a Polish word signifying 'lancers'), light cavalry of Asiatic origin, were introduced into the north of Europe along with the colonies of Tartars who establishad themselves in Poland and Lithuania. They were mounted on light active Tartar horses, and armed with sabre, lance, and latterly with pistols. Their lance was from 5½ to 6½ feet in length, and like that of the modern 'lancers,' was attached to a stout leather thong or cord, which was fastened to the left shoulder, and passed round behind the back, so as to allow the lance to be couched under the right arm. Immediately below its point was attached a strip of gaudy-colored cloth, the fluttering of which was designed to frighten the enemies' horses. The early dress was similar to that of the Turks, and the regiments, or *polks*, were distinguished from each other by the red, green, yellow, or blue color of their uniforms. The Austrians and Prussians were the first to borrow this species of cavalry from the Poles. In 1734, an attempt was mode by Marshal Saxe to introduce the U. into France, and a 'polk' of 1000 men was formed; but it was disbanded at its author's death. The Prussian Uhlans won great renown in the Franco-German war of 1870—1871 by their bravery and marvelous activity. The Prussians applied the term, however, rather loosely, including all their light cavalry under the designation.

UIST, NORTH AND SOUTH, two islands of the Outer Hebrides, are situated from 15 to 18 miles west of the Isle of Skye, from which they are separated by the Little Minch. Unlike the other islands of the Hebrides, the east coasts of North and South U. are much and deeply indented, while the west coasts are, as a rule, almost unbroken.—NORTH U., between which and *South U.* the island of Benbecula intervenes, is 18 miles long from west to east, and from 10 to 3 miles in breadth. The eastern half of it is so cut up by lochs and watercourses as to have the appearance of an archipelago. This region is a brown, peaty, dreary bog, partly relieved, however, by a line of low hills running along the coast at the distance of about 2½ miles. In the west part, which, as a rule, is hilly, there is a tract of uneven, low land, exceedingly

beautiful in certain seasons, rendered fertile by the drifting of shell-sand from the coast, and producing good clover and grain crops. Pop. (1881) 3371.—SOUTH U., 20 miles long, and 7 miles broad. Its east coast is much indented by the lochs Skiport, Eynort, and Boisdale. The eastern district is upland; the western is alluvial and productive, under proper treatment. Pop. (1881) 3825, engaged, like the inhabitants of North U., in fishing and agriculture.

UJEI'N, one of the seven sacred cities of Hindustan, in Sindia's dominions, of which it was formerly capital, stands on the right bank of the Sipra, 35 miles north-north-west of Indore. It is surrounded by walls with round towers, is six miles in circumference, contains the grand palace of the head of the Sindia family, several mosques and mausoleums, an observatory, and an antique gate. The number of the inhabitants is not ascertained.

U'JHELY-SATORA'LYA, a market-town of Hungary, 105 miles N.W. of Pesth. It is noted for its wine-culture. Pop. (1880) 11,264.

UJIJI, a small country or district on the eastern shore of Lake Tanganyika. The chief town in it, Kawélé, is the terminus of the great caravan route from Zanzibar, and is an important Arab station.

UKASE, or UKAS (Russian *ukasat*, to speak), a term applied in Russia to all the orders or edicts, legislative or administrative, emanating from the government. The ukases either proceed directly from the emperor, and are then called *imenny ukas*, or are published as decisions of the directing senate. Both have the force of laws till they are annuled by subsequent decisions. Many ukases are issued in the course of one reign; and as an immense chaos of ukases had accumulated since 1649 (the date of the last codification of laws), the Czar Nicholas ordered (1827) that a collation of them should be made. The result was a collection of laws in 48 volumes, which has been supplemented year by year by volumes of new ukases, and which, after the elimination of such ukases as are unimportant or of temporary authority, constitutes the present legal code (*svod*) of the Russian Empire. The *prikases* are imperial 'orders for the day,' or military orders given during a campaign.

UKRAI'NE (Slav. a frontier country or March), the name given in Poland first to the frontiers towards the Tartars and other nomads, and then to the fertile regions lying on both sides of the middle Dnieper, without any very definite limits. The U. was long a bone of contention between Poland and Russia. About 1686 the part on the east side of the Dnieper was ceded to Russia (Russian U.); and at the second partition of Poland, the western portion (Polish U.) also fell to Russia, and is mostly comprised in the government of Kiev. The historic U. forms the greater part of what is called Little Russia (a name which first appears about 1654), which is made up of the governments of Kiev, Tchernigov, Poltava, and Kharkov.

ULCERA'TION is 'that part or effect of an inflammatory process in which the materials of inflamed tissues liquefy or degenerate, are cast off in solution or very minute particles from free surfaces, or, more rarely, are absorbed from the substance of the body.'—Paget on 'Ulcers,' in Holmes's *System of Surgery*, vol. i. p. 197. Generally speaking, however, the name of ulcer is not applied to any inflammatory result, unless the substance of a tissue deeper than the epithelial is exposed; and when the cast-off particles are only epithelial, the result is termed desquamation, abrasion, or excoriation, although the process may be essentially the same. Ulceration is closely allied to gangrene, the two processes differing in degree rather than in kind. 'When the degenerate or dead substance,' says Sir J. Paget, 'is cast off in one or more portions visible to the naked eye, the process is usually called gangrene; when the portions are not so visible, or are quite dissolved, it is called ulceration.' The degenerate tissues are always suspended or dissolved in a liquid, termed the 'discharge,' or 'ichor,' which varies in appearance and properties according to the cause and characters of the ulcerative process. 'From some ulcers, e.g., the primary syphilitic, it is contagious; from many, it appears corrosive, exciting by its acridity inflammatory changes in the tissues with which it is in contact.'

U'LCERS (derived from the Latin *ulcus*, a wound) may be arranged either according to the constitutional or specific disease from which they are derived, or according to the characters which they present. According to the first system, we speak of ulcers as healthy, inflammatory, strumous, &c.; while, according to the second, they are named irritable, chronic, sloughing, &c. In this article, we shall adopt the former of these arrangements, as being, upon the whole, the most satisfactory, although each possesses its own advantages.

A *common, simple or healthy ulcer* is such as is left after the separation of an accidental slough in a healthy person, and is merely a healthy granulating surface, tending to cicatrization. Its edges shelve gently down to the base, and are scarcely harder than the adjacent healthy skin. Their surface near the border is of a purplish blue tint where the young epidermis modifies the color of the healing granulations; and within this, the granulations have a deeper hue than those at the center, being most vascular where the cuticle is being chiefly developed. The discharge from such an ulcer is healthy or 'laudable' pus. The only treatment required is a little dry lint, if there is much discharge; or the water-dressing, if the sore is comparatively dry. When the granulations are too luxuriant, they must be touched with nitrate of silver, and dressed with dry lint. *Inflammatory ulcers* differ less than most kinds from the above described common or healthy ulcers. They commonly arise from some trifling injury, such as a blow or slight abrasion of the skin, which, to a healthy person, would have done no harm. Their most common seat is on the lower half of the leg or shin. Their surface is red, and bleeds easily; the discharge is thin and watery; the edges irregular or shreddy; and the surrounding skin shows a red tinge, and is the seat of a hot and aching sensation. This ulcer most commonly occurs in the infirm and old, the ill-fed and overworked. Hence constitutional treatment, good diet, and complete rest (with elevation of the limb) are here demanded, in addition to water-dressing or lead-lotion applied warm. *Senile ulcers* usually present very little discharge, exhibit granulations of a rusty red tint, and are surrounded by a dusky red area. Nourishing food, wine, bark, and the mineral acids are here required, and opium in small repeated doses is often serviceable. The local treatment must be of a stimulating nature; and in bad cases, Sir. J. Paget recommends strapping the leg daily with a mixture of resin ointment and Peruvian balsam spread on strips of lint. *Strumous* or *scrofulous ulcers* usually occur as the consequence of scrofulous inflammation in the subcutaneous tissue or lymphatic glands. They most commonly occur in the neck, groins, cheeks, scalp, and the neighborhood of the larger joints. The discharge is thin, and of a greenish-yellow tint. These ulcers are seldom very sensitive or painful. The general treatment must be that recommended for constitutional Scrofula (q. v.). Iodine, in some form or other, is the best local application.

A poultice of bruised and warmed sea-weed is a very popular remedy; but there is probably nothing so efficacious as tincture of iodine diluted with water till it causes only a slight discomfort, and applied three or four times a day. (About 30 drops of the tincture may be added to an ounce of water, to begin with.) Of the numerous other species distinguished by Sir J. Paget, we shall briefly notice the *Varicose*, *Indolent*, and *Sloughing Ulcer*. *Varicose Ulcers* are connected with an enlarged or varicose state of the veins of the lower extremity, which weakens the parts, and renders them especially liable to ulceration. See VARICOSE VEINS. The *chronic, indolent, or callous ulcer*, beyond all doubt, gives more trouble to the poor-law medical officer and the workhouse surgeon than any other half-dozen surgical affections. It is usually seated in the lower half of the leg, and is most commonly of an oval form, with its long axis parallel to that of the leg. 'Its base lies deep, and is flat, pale, or tawny and dusky, with very minute or no visible granulations. The margin is usually abrupt, or unequally shelving, and in its most characteristic form, strictly overlaid with opaque, white, dense epidermis.'—Paget, *op. cit.*, p. 217. Many volumes have been written on the proper means of treating this form of ulcer. The distinguished surgeon from whose Memoir we have so largely quoted, especially recommends opium, regulated pressure, and blistering. A grain of opium night and morning is usually sufficient. The pressure is applied with straps of adhesive or lead plaster on linen. The object of blistering is not only to stimulate the ulcer, but to soften its callous edges by causing absorption of part of the exudation with which they are infiltrated, and desquamation of the cuticle which covers them. The expediency of healing old ulcers of this kind has often been called in question, inasmuch as apoplexy, palsy, mania, and other serious diseases are said to have followed the healing of such ulcers. In the following cases, it may be decided that a cure should not be attempted. (1) If the ulcer be affected by the gout, having regular attacks of pain, returning at stated periods, and similar to what the patient has experienced from gout in other parts. (2) If an ulcer habitually occur whenever the constitution is disordered. (3) If the patient be very infirm and old; for under these circumstances the removal of a habitual source of irritation, or the diversion of a habitual efflux of blood, may prove fatal; and especially as very old ulcers have been known to heal spontaneously a short time before death. To these cases, specified by Sir E. Home, Dr. Druitt adds (4) that of ulcers on the legs of stout women about the critical period of life, and displaying a tendency to discharge profusely as the menstrual discharge diminishes. To counteract these dangerous tendencies, the bowels should be freely purged during, and for some time after, the cure of an old ulcer; and if there are any symptoms of congestion in the head, a seton should be inserted in the back of the neck.

For the treatment of *Sloughing Ulcers*, we must refer to the article SYPHILIS.

U'LEABORG, a seaport town of Russian Finland, capital of the government of the same name, stands on the south bank of the Ulea, on the eastern shore and near the head of the Gulf of Bothnia. It was founded in 1605, and the privileges of a port were granted to it in 1715. In 1822, it suffered severely from fire. The harbor has of late years become so shallow, that vessels are obliged to unload in the roadstead, four miles from the town. Pop. (1880) 9705, who are engaged in the dockyards, sawmills, and breweries of the town. In 1854, an English flotilla burnt the government property in the place.

ULE'MA, the collective name of a certain class of theological jurists in Turkey, who, as is the case in Mohammedan countries, derive their decisions from the Koran and its commentaries. The Ulema enjoys many privileges; he pays no taxes, cannot be condemned to death or deprived of his property by any court of law. He can only—eventually—be deposed and banished. The ulemas have to recognize, save their two immediate superiors (the *kadiasks* or *kadilesks*), only the mufti as their chief authority, whilst they are the superiors of all the Mollahs (q. v.) in the different provinces. The kadis form the lowest judicial class, and are subject to the mollahs in every respect.

U'LEX. See FURZE.

ULFILAS (*Ulphilas*, *Wulfilas* = little wolf), the celebrated translator of the Bible into Gothic, was born about 318 A.D., of Marcomannian parents, north of the Danube, among a Gothic population. Consecrated bishop in 348, he was expelled by his heathen compatriots from his native place, and sought refuge, together with a number of newly-converted Christians, in Lower Mœsia, at the foot of the Hæmus, where he remained for thirty years. In 388, he went to Constantinople (whither he had gone once before to assist at a council, in 360), and died there shortly afterwards. He was one of the chief lights of Arianism (see ARIUS), in the interest of which he exerted himself with the utmost energy. Nor was his political influence less felt among his Gothic countrymen; and the contemporaneous Greek historians, no less than those that followed within a short time after his death, are unanimous in attributing to him the largest share in the religious and social development of the Gothic population. His greatest work, however—one which will render his name famous for all ages—is his Gothic translation of the Bible, a work by which he contrived both to fix the Gothic language and to perpetuate Christianity among the Gothic people. Familiar with Latin, Greek, and Gothic, and accustomed to write in each of them, he undertook to render the whole Bible, with the exception of the two warlike books of Samuel and Kings—the influence of which he feared for his easily inflammable people—into a language which till then had, as far as we know, never been used for any literary composition of importance. Up to the 9th c., this sacred and national work accompanied the Goths in all their migrations. But from that period forth, nothing was known of it beyond what was found stated in the ancient ecclesiastical accounts. It was not till the end of the 16th c. that Arnold Mercator discovered in the Abbey of Werden the four Gospels of Ulfilas. Thence it found its way to Prague, where it remained till 1648, when the Swedes took it as a spoil to Upsal, where it still remains in the University Library, under the name of the *Codex Argenteus*. In 1818, further remnants of the work—a great portion of the Letters of St. Paul—were discovered by A. Mai and Castiglioni, on palimpsests, in a Lombardian monastery, which, added to a few minor fragments, bring the New Testament somewhat near completion. But hardly anything—save a few passages from Ezra and Nehemiah—has survived of the Old Testament. The immense importance of this sole Gothic remnant for Teutonic philology cannot well be overrated. It is principally through it that the wonderfully fine structure of Gothic—a Germanic dialect of surpassing wealth and purity—has become known.

U'LLSWATER, after Windermere, the largest of the English 'Lakes,' lies between the counties of Cumberland and Westmoreland, 10 miles east of Keswick. Length, 9 miles; breadth, 1 mile. Its scenery has none of the soft beauty of that of Windermere, but is rugged and grand. One of the chief features of the landscape is the lofty mountain Helvellyn, which rises from the southwest extremity of the lake.

ULM, the second city of Würtemberg, in 49° 54′ N. lat., and 8° 8′ E. long., was, till the war in 1866, a stronghold of the Germanic Confederation, garrisoned by troops of Würtemberg, Austria, and Bavaria. It was long one of the most important imperial free cities. U. is situated at the junction of the Blau with the Danube, which then becomes navigable, 53 miles west of Augsburg by railway. Two bridges unite the city with New Ulm, a village on the Bavarian side of the river. The streets are narrow, and the buildings old. Pop. (1871) 26,290; (1880) 32,669. The environs of U. are flat. The cathedral, which is a Protestant church, is remarkable for architectural beauty, and is, next to the cathedral of Cologne, the largest church in Germany. It is 475 feet in length, 165 in breadth, and 140 in height, the unfinished tower over the main entrance being 320 feet. The building was begun in 1377, and finished in 1494. There are good schools for the people, a gymnasium, high school, and trades' school, a public library, an agricultural society, and many charitable institutions. Leading industries are weaving linen, cotton, woollen, and mixed fabrics; bleaching; making paper, leather; beer-brewing; ship-building; book-printing, &c. U. is famed for ornamental pipe-bowls, and pastry called Ulmer bread. Around the city, gardening is extensively carried on, and asparagus especially cultivated.

The Romans had a settlement at this important point. In 1531, the city accepted the Reformation, and the majority of the people have since been Lutherans. In 1802, U. was attached to Bavaria, and became part of Würtemberg in 1810.

ULMA'CEÆ, a natural order of exogenous plants, regarded by some botanists as a sub-order of *Urticaceæ*. They are trees or shrubs, having rough alternate leaves, each leaf with a pair of deciduous stipules. The flowers are small and in loose clusters. The perianth is small, membranous, bell-shaped, irregular; the stamens equal in number to the lobes of the perianth, and inserted into their base; the ovary superior. The fruit is 1—2-celled, nutlike, or compressed and winged. There are about 60 known species, natives of temperate parts of the northern hemisphere. See ELM, NETTLE-TREE, and ZELKOUA.

U'LMIN. See HUMUS.

U'LNA. See ARM.

ULODE'NDRON, a singular genus of coal-plants, founded on stems which occur chiefly in the roof-shales. The stems are covered with small rhomboidal scars, as in Lepidodendron, formed by the bases of leaves or scales; but they differ remarkably from that genus in having a double series of large oval or circular markings, arranged linearly on the opposite sides of the trunk. These markings are variously interpreted as representing the cicatrices produced by the bases of cones, by branches, or by leaf-stalks. It is, like many of the coal fossils, an extremely enigmatical plant; and it is difficult to determine its position in the vegetable kingdom. It is probably an ally of Lepidodendron, and that is known to be a vascular cryptogam nearly related to Lycopodium. Seven species are known.

ULPIA'NUS, DOMITIUS, a celebrated Roman jurist, of Tyrian extraction, flourished in the early part of the 3d century. The exact date of his birth, however, is unknown. He appears to have held juridical offices during the reigns of Septimius Severus and Caracalla, of which he was deprived by Elagabalus; but, on the accession of Alexander Severus (222 A.D.), he became the principal adviser of that emperor, who appointed him *scriniorum magister* (keeper of the public records), a *consiliarius* (public assessor), and *præfectus annonæ* (superintendent of the corn market). He also held, during the reign of Alexander Severus, the important post of prefect of the Prætorian Guards, though it is uncertain whether that monarch first conferred it upon him. He was murdered by his own soldiery, 228 A.D. U. was both a voluminous and a valuable writer.

In the *Digest* of Justinian, there are no fewer than 2462 excerpts from him, many of which are of considerable length. Altogether, they form about a third of the whole body of the *Digest*. Unfortunately, the originals have almost entirely perished. The principal were—*Ad Edictum* (83 books), *Ad Sabinum* (51 books), *Ad Leges Juliam et Papiam* (20 books). The so-called *Fragmenta* of U. (first published at Paris by Tilius in 1549) consist of 29 titles, whence they are called in the Vatican MS. *Tituli ex Corpore Ulpiani*. The best edition is Böcking's (Bonn, 1836).

ULRIC, ST., Bishop of Augsburg, and venerated as one of the Fathers of the German Church, was born at Augsburg about the year 890. His father, Hupald, was one of those counts of Dillingen who play so important a part in medieval German history, and U. himself owed part at least of the extraordinary influence which he exercised in his time, to the distinguished rank of his family. He was educated in the celebrated Benedictine monastery of St. Gall (q. v.) in Switzerland; but his later life, and the character of his mind, as well as the tendency of his religious views, appear to have been influenced less by his monastic instructors, than by the counsels of a remarkable female recluse named Wiborada, whose cell was in the vicinity of St. Gall, and with whom he formed a close association. It was by her counsel that, instead of adopting the Benedictine habit at St. Gall, he devoted himself to the secular ministry, and returned to his native diocese of Augsburg, where he received holy orders. In accordance with the usage of his time, he made a pilgrimage to Rome, and soon after his return, was consecrated Bishop of Augsburg, on the death of Hiltine in the year 923. The details of his history as administra-

tor of this church, which had suffered serious disorganization through the Magyar invasion and other wars, would be out of place here; but they are related with much circumstantiality by his contemporary biographer; and they throw so much light as well on the externals of the religious life of the time, as on the moral and spiritual character of the people, laity as well as clergy, as to merit the most serious consideration of every student of medieval history.

Bishop U. bore an important part in the public affairs of the empire during the reign of Henry I. and his son Otho; and he was the guiding spirit of the several councils in Germany which, in the 10th c., labored at the work of reformation. He died in 973.—See the ancient *Vita S. Oudalrici Episcopi*, which is edited by Mabillon, by the Bollandists, and recently by Dr. Pertz. Some letters and sermons, still extant, have been ascribed to U., but they are regarded as spurious by Mabillon and Pertz, as well as by the Bollandists.—See Braun's *Geschichte der Bischöfe von Augsburg*.

ULRICI, HERMANN, a German philosopher, born at Pförten in Lower Lusatia, 23d March 1806, studied at Halle and Berlin, and after a brief career as a lawyer, devoted himself exclusively to literature and philosophy. In 1834 he was appointed a professor-extraordinary at Halle, where he still occupies a chair. His first work was his *Geschichte der Hellenischen Dichtkunst* (1835), which was followed by a very ingenious essay on the dramatic art of Shakspeare (*Ueber Shakspeare's dramatische Kunst*, 1839; Eng. transl., 1846). Other works of U.'s are his *Ueber Princip und Methode der Hegel'schen Philosophie* (1841); *Das Grundprincip der Philosophie* (1845–6); a *System der Logik* (1852); *Gott und die Natur* (1862; 2d ed. 1866), *Gott und der Mensch* (1866), in which U. develops a system of theistic philosophy, in opposition to materialism and anti-ethical pantheistic speculation. Further Shakspearian studies we have in *Romeo und Julia*, and a *Geschichte Shakspeare's und seiner Dichtung* (1867).

U'LSTER (Lat. *Ultonia*), a province of Ireland, the most northern of the four provinces which compose that kingdom (see IRELAND), is divided into nine counties—Antrim, Armagh, Cavan, Donegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone, each of which is described under its proper head.

The territorial distribution under which U. formed a province, or at least a distinct territory, is of very ancient origin. It formed one of the five ancient divisions of Ireland, and was the seat of the Hy-Nialls or O'Neills, as well as of the lesser septs of O'Donnell, O'Cahan, O'Doherty, Maguire, MacMahon, &c. The north-eastern portion, now the county of Down, was early overrun by John de Courcy, and subsequently by Hugh de Lacy, and was the most permanent seat of English power in the north. The Antrim coast was occupied by a Celtic colony from Scotland and the Isles; but although various efforts were made by the English to effect a permanent settlement in the north and north-west, the success was but nominal until the reigns of Elizabeth and of James I., when the Plantation of U. was effected. Of this gigantic scheme of colonization, the chief seat was the county of Londonderry (q. v.). In U., the Celtic race, owing to the frequent and large infusions of a foreign element, is found in a much smaller proportion. In 1861, the whole population was 1,910,108, the Roman Catholics numbering 963,687. These proportions, owing to emigration, were reversed in the returns of 1871—total, 1,833,228, of whom the Catholics were only 897,230. Of the total population in 1881, 1,739,542, the Protestants of all denominations made up 907,014; the Roman Catholics, only 831,784. Of the former, the greater number, viz., 466,107, were Presbyterians, 377,936 belonged to the Episcopalian Church, and the rest were Protestants of other denominations.

ULSTER BADGE. On the institution of the order of Baronets in England by James I., a sinister hand, erect, open, and couped at the wrist gules, the armorial ensign of the province of Ulster, was made their distinguishing badge, in respect of the order having been intended for the encouragement of plantations in the province of Ulster. This badge is sometimes borne in a canton, sometimes on an escutcheon, the latter placed either in the fess point or in the middle chief point, so as to interfere as little as possible with the charges of the shield.

ULSTER KING-OF-ARMS, the king-of-arms, or chief heraldic officer of Ireland. A king-of-arms called Ireland existed in the time of Richard II., but the office seems to have fallen into abeyance in the following century. Ulster was created to supply his place by letters-patent of Edward VI. in 1552. Ulster holds his appointment from the crown, and acts under the immediate direction of the Lord-lieutenant of Ireland. His office is in the Record Tower of Dublin Castle; and the professional staff under him consists of two heralds, four pursuivants, one registrar, and one clerk of records. The records of Ulster's office comprise pedigrees of the nobility and gentry of Ireland, certificates of their deaths and funerals, and grants of arms. The official arms of Ulster King-of-arms are: Argent, St. George's cross gules, on a chief of the last a lion passant gardant between a harp and a portcullis or.

ULTIMA'TUM, in Diplomacy, the final conditions or terms offered by one government for the settlement of its disputes with another: the most favorable terms which a negotiator is prepared to offer, whose rejection will generally be considered to put an end to negotiation.

U'LTIMUS HE'RES, in the Law of Scotland, means the crown, which is the last heir after all the kin have become exhausted, and succeeds to the property of those who die without leaving next of kin, or who, being bastards, have no next of kin.

ULTRAMARI'NE, a beautiful blue pigment, formerly obtained only from the very valuable mineral, lapis-lazuli; but an artificial kind is now made so cheaply, and is so good, that it is generally used instead. The true ultramarine, from its costly nature, was only used by artists; the artificial sort is, however, extensively used by house and ship painters, and is as cheap as it is beautiful. Many artists still insist upon having the former kind, which is prepared as follows: Fine lapis-lazuli is broken up into very small pieces, so as to enable the operator to see and pick out the small white portions which occur in it. Of the pieces of pure blue which remain, a pound-weight is then taken, and in a carefully covered crucible, is heated to redness, and then thrown into cold water. It is next reduced to an impalpable powder, and mixed with six ounces of finely powdered resin, as light in color as it can be obtained, and two ounces each of spirits of turpentine, bees-wax, and linseed oil, all previously melted together.

When these ingredients are thoroughly worked into a mass, portions of it are taken and kneaded in clean water; as long as any blue color is given out, this is continued, until every portion has been so treated. The blue water is then allowed to rest, and the sediment is collected and washed in water several times. The first washing removes a considerable quantity of dirt and other foreign matters, and is consequently rejected. The second, after being well agitated, is decanted; and from it is obtained the highest quality of the pigment. That which remains, usually has two other washings, each of which gives a product of a less value than the operation which preceded it. The product obtained by sediment from each of the waters used, is carefully dried, and is then employed either to make cakes for water-color painting, or a mixture for oil-painting, the value being about £1 per ounce. ARTIFICIAL ULTRAMARINE.—The French chemists Clement and Desormes, in studying the curious process of obtaining ultramarine from lapis-lazuli by mixing it with resin, &c., were led to an analysis of the coloring matter that suggested to Guimet the idea of composing it artificially. In this he succeeded, and obtained for his discovery the prize of 6000 francs offered by the *Société d'Encouragement des Arts*. Almost simultaneously, Gmelin in Tübingen gave an analysis and a synthetic process which also succeeded, and artificial ultramarine is now a regular article of manufacture. Chemical skill, however, is necessary to success, and the manufacturers' formulas are very various—differing in the quantities of the ingredients, and the order of mixing them.

The German manufacturers are very successful, and some of them have recently produced a fine green ultramarine. The following formula is one of the simplest: 100 parts of finely washed kaolin or porcelain clay (silicate of alumina), 100 of carbonate of soda, 60 of sulphur, and 12 of charcoal, are mixed and exposed in a covered crucible to a bright heat for 3½ hours, when a green, unfused residue should be left. This residue, after being well washed and dried, must be mixed with a fifth of its weight of sulphur, and exposed in a thin layer to a gentle heat, so as just to burn off the sulphur. When this is accomplished, more sulphur must be added, and the washing repeated; and so on, until the mass acquires a light blue color, which is usually the case after the third roasting. In 1872, however, Fürstenau introduced improvements into the manufacture of ultramarine, showing how the blue tint could be produced in one calcination. There is reason to believe, from the experiments of Wilkens, that ultramarine is composed of two portions—one of which is constant in its composition, and is the essential coloring matter, containing about 40 of silicic acid, 26 of alumina, 13 of sulphur, and 21 of soda, arranged as a mixture of two silicates of alumina, sulphite of soda, and sulphide of sodium—the blue coloring principle being a compound of the latter two; while the other portion differs from the former in resisting the action of hydrochloric acid, and contains a variable amount of sand, clay, oxide of iron, and sulphuric acid. Ultramarine, if heated in the air, gradually assumes a dull green tint; and it is quickly decomposed by the action of the mineral acids and chlorine.

The term *Yellow Ultramarine* is sometimes given commercially to chromate of baryta, a yellow insoluble powder used as a pigment.

ULTRAMO'NTANE (Lat. beyond the mountains—the Alps—namely, in relation to France), that party in the Church of Rome

which assigns the greatest weight to the papal prerogative. The pope, according to the U. doctrine, is superior to general councils, and independent of their decrees; he is considered to be the source of all jurisdiction in the church; and it is through him, and not directly in virtue of their episcopal office, that the bishops derive their powers of 'jurisdiction' as distinguished from those of 'order.' See ORDERS. The U. school has been the opponent of those doctrines and views which favor the right of self-government by national churches. The school opposed to the U. is called the Gallican. See GALLICAN CHURCH.

ULUGH-BEG, the grandson of Timûr (q. v.), governed Western Turkestan as regent for his father Shah Rokh, while the latter was employed in regulating the affairs of the southern half of the empire, and succeeded, in 1447, to the imperial throne on his father's death. He was a successful warrior, as was of necessity every ruler of this period; but happening, unfortunately, to conceive suspicions of the loyalty of his eldest son, suspicions founded only upon astrological indications, the offended and injured prince rebelled, defeated and captured his father, and soon after caused him to be put to death, thus fulfilling the prediction, 1449 A.D.

U. is known to posterity as the founder of the observatory at Samarkand, as the liberal patron of astronomers, and as himself a most diligent observer. The astronomical tables which bear his name, in all probability compiled by himself and his two fellow-laborers, Salah-ed-din Cadizadeh al Roumi and Gaiathed-din Mohammed Jerusheid al Coushgi, enjoy a high reputation for accuracy, considering the time when they were compiled, and the means of observation in the hands of astronomers. The astronomical works of U. were written in Arabic, afterwards translated into Persian, and thence the chronological portion of them rendered into Latin (Lond. 1650), by Greaves, who followed with a Latin version of the geographical part in 1652. An independent version of the same work in Latin and Persian was published by Dr. Thomas Hyde, at Oxford, in 1665. A new edition of U.'s catalogue of stars will be found in the *Memoirs of the Royal Astronomical Society*, vol. xiii.

ULULA'TION (Lat. howling). It sometimes happens that articulate sounds or cries resembling, perhaps imitative of those of animals, or mere shrieking and howling, form the sole or chief symptom and characteristic of a morbid mental state. The act is automatic, and may be regarded as indicative of grave changes in the physical and moral nature. In the middle ages, during great religious excitement, and those mental epidemics which involve large communities, such phenomena appear to have been of frequent occurrence. It appears that in the 18th c., a family of five sisters, in the county of Oxford, were affected with a modification of hysteria, during which they howled or barked like a dog, and that, about the same period, a large religious community of females in France, one and all, and at the same hours, shrieked or mewed like cats; and were only reduced to sobriety and to silence by the presence of military.—Laycock on *Nervous Diseases of Females*, p. 286; Calmeil, *De la Folie considérée sous le point de Vue Pathologique, Philosophique, Historique, et Judiciare*, t. ii. p. 310.

U'LVA. See LAVER.

U'LVERSTON, a small but important market-town and seaport of Lancashire, in the district of Furness, 22 miles by railway north-west of Lancaster. It stands in an extensive agricultural and mining district, and is the center of commerce for Furness, and for parts of Cumberland and Westmoreland. It contains cotton and paper mills, and carries on manufactures of linen, ropes, and woollen yarn, and has a coasting-trade in iron and copper ores, limestones, grain, and gunpowder. Pop. (1871) 7607; (1881) 10,001.

ULY'SSES, ULYXES, AND ULIXES, the Latin forms of the Greek ODYSSEUS, i. e., the 'Angry,' the name of one of the most celebrated heroes of the Trojan war. Different accounts are given of his parentage; but according to the oldest legend, the Homeric, he was the son of Laertes, Prince of Ithaca (one of the Ionian Isles), and of Anticleia, daughter of Autolycus. According to a later account, his father was the crafty Sisyphus; whence he is sometimes called, by way of reproach, Sisyphides. He married Penelope (q. v.), by whom he became the father of Telemachus. While still a youth, he had acquired a reputation for courage, eloquence, and address. When the expedition against Troy was resolved on, Agamemnon visited Ithaca, and prevailed on U., though with difficulty, to take part in it. Later traditions, or, as in this case, perhaps we ought to call them *inventions*, go on to exaggerate the reluctance of U. to leave his home, and represent him as feigning madness—an artifice which did not, however, succeed. Before hostilities broke out, U., in conjunction with Menelaus and Palamedes, was sent to Troy, with the view of persuading the Trojans to give up Helen and her treasures; but this little bit of diplomacy having failed, the Greek princes assembled their fleets in the port of Aulis, and sailed for Troy, U. bringing with him twelve ships. During the siege, U. performed important services for the Greeks. In prudence, ingenuity of resource, and *finesse*, he was the foremost of the Hellenic chiefs, while in courage he was inferior to none. After the fall of Troy, the most interesting part of U.'s career begins, and forms the subject of the Homeric poem called the *Odyssey*. Several of his adventures are manifestly of eastern origin, and closely resemble those of *Sinbad the Sailor*. Setting sail for home, his ships were driven by a storm on the coast of Thrace, where he plundered the town of Ismarus, but lost a number of his crew.

Having re-embarked, a north wind blew them across the Ægean and the Levant, to the country of the Lotophagi (the 'Lotus-eaters'), on the coasts of Libya, where the companions of U. ate of the wondrous fruit, and wished to rest for ever. (Our readers will remember Tennyson's delicious rendering of this episode.) But their leader compelled them to leave the land 'in which it alway seemeth afternoon;' and sailing north again, they touched at the 'island of goats,' where U. left all his ships but one. Thence he proceeded westward, till he reached the 'Island of the Cyclopes' (Sicily), where occurred the incident narrated under POLYPHEMUS (q. v.). The island of Æolus, and the city of the Læstrygones (a race of cannibals), whither fortune and the winds next carried the Hellenic chief, are supposed to be only names for particular parts of Sicily. Thence he sailed westward to the island of Ææa, inhabited by the sorceress Circe (q. v.). After a year's sojourn, he departed, and sailing still further west, crossed Oceanus, the 'ocean-stream,' into the country of the Cimmerians (q. v.), where darkness reigns perpetually. Here (following the advice of Circe) he descended into Hades (q. v.), and inquired at the blind seer Teiresias how he might get back to his native land. Teiresias disclosed to U. the fact of the implacable enmity of Poseidon (Neptune), on account of his having rendered Polyphemus (who was a son of Poseidon by the nymph Thoosa) blind, but encouraged him at the same time with the assurance that he would yet reach Ithaca in safety, if he would not meddle with the herds of Helios (the sun-god) in Thrinacia.

U. now retraced his course, and once more visited Circe, the kindly sorceress, who forewarned him of the dangers he would yet have to encounter, and how to act. A west wind blew them past the perilous island of the Sirens (q. v.) to the coasts of Italy. In passing between Scylla and Charybdis, the monster that inhabited the first of these rocks devoured six of U.'s companions. He next came to Thrinacia, which he would fain have passed by, but his crew insisted on landing, and in spite of their oath, killed some of the cattle of Helios while U. was asleep. The anger of Zeus was kindled. When they had sailed away, a fierce storm arose, and Zeus sent forth a flash of lightning that destroyed the ship. Every one on board was drowned except U. himself, who, after many dangers, reached the island of Ogygia, the abode of the nymph Calypso, with whom he lived for eight years. After his departure (which was commanded by Zeus, who had promised to Athene that U. should one day see Ithaca again—the poet always represents him as having a longing after his native isle), Poseidon persecuted him with a storm, and cast him on the shores of Scheria, the island of the Phæacians, in a very forlorn and indescribable condition. He was, however, very kindly received by Nausicaa, daughter of King Alcinous; and having revealed his name at a feast, the monarch provided him with a ship to carry him home. U. was asleep when the vessel approached the coast of Ithaca; and the Phæacian sailors who had accompanied him bore the unconscious hero to the shore, and left him there. When he awoke, he did not at first recognize where he was; but Athene appearing, informed him, and of all that had happened to Penelope (q. v.) in his absence. Disguised as a beggar, he repaired to his own court, where he was recognized by his nurse, and, as Homer touchingly describes, by his old dog, Argus.

Aided by Telemachus, and the swine-herd Eumæus, he took vengeance upon the insolent suitors of his wife, all of whom, without exception, he slew. Homer records nothing more of U.'s history; but he makes Teiresias prophesy, in the 11th book, that the hero would meet a painless death in a happy old age. Another tradition says that he was slain by Telegonus, his son by Circe. Later poets, e. g., Virgil and Ovid, represent U. as a much less noble and valiant character than he appears in Homer; his wisdom and subtlety are changed into cunning and deceit; and instead of heroic courage, he displays the spirit of a coward.

UM is a Kaffir or Zulu word signifying river, and is used as prefix in the names of most of the rivers on the south-east coast of Africa, from the Great Kei, where the names of Hottentot origin appear to cease, as far to the north-east nearly as the Sofala coast, where the names Imhambane, Imhampoora, have the same prefix in a corrupted shape. Amongst the principal rivers on this coast bearing this prefix may be mentioned the Umgazi, Umbashee, Umtata, Umzimvoobo, and Umzimculu, draining Independent Kaffraria; the Umcomanzi and Umtugela, in the colony of Natal;

and the Umfolusi, Umhlatoozi, and Umapoota, between Natal and Delagoa Bay. The Hottentot word Kei has the same meaning, and is still preserved in the Kei and Keiskamma rivers, the Keriega, Keisuga, and other streams on the east-coast of the Cape Colony.

UMA is, in the epic and Purânic mythology of India (see *Religion*, under INDIA), one of the principal names of the consort of the god S'iva. Other names by which she is also usually designated are *Durgâ*, *Devî*, *Kâlî*, *Pârvatî*, *Bhavânî*, while there are many more belonging to her which are of less frequent occurrence, as *Kâtyâyanî*, *Ambikâ*, *Haimavatî*, *S'ivâ*, &c. As S'iva is not yet a deity of the Vedic period of India, such of these names as are met with in Vedic writings have there a different import from that assigned to them by the later mythology. Thus *Ambikâ* is, in the Yajurveda, a sister of *Rudra* (q. v.); *Kâlî*, a word which occurs in the Mun'd'aka Upanishad (q. v.), is there the name of one of the seven flickering tongues of Agni, the god of fire; *Durgâ*, in a hymn of the Taittirîya Aran'yaka, is an epithet of the sacrificial flame; and *Umâ*, when mentioned in one recension of the same Aran'yaka (see VEDA and UPANISHAD), and in the Kena Upanishad, means the Brahma-science, or the knowledge of what is the nature of Brahman, the Supreme Soul; and in this sense she is identified in the Taittirîya Aran'yaka with Ambikâ. But since Rudra is in later mythology a name of *S'iva*, and the Vedic Rudra is a form of Agni, the fire, more especially of the fire of the sun; and since Umâ, in the Kena Upanishad probably designates the power of Sûrya, the sun, it becomes intelligible that S'iva (q. v.), who, at a later period of Hindu religion, is both the type of destruction and contemplation, had then associated with him deities which originally represented the energy of the fire and the power or wisdom of the sun, and that those deities were afterwards held to be merely different forms or names of one and the same deity, viz., his female energy (see S'AKTAS), or wife.

Though this double character of the consort of S'iva is not always discernible in the myths which are connected with special designations of hers, and though at a late period the popular creed looked upon her far more as the type of destruction than as that of divine wisdom, yet the works devoted to her praise never fail to extol her also as the personification of the highest knowledge. Thus, in the *Devîmâhâtmya*, the Rishi Mârkan'd'eya, in reply to a question of King Suratha, says: 'By Devî, this whole universe, with what is movable and immovable, has been created, and, when propitious, she who bestows blessings leads men to their eternal bliss; for she, the eternal goddess, is the highest wisdom, the cause of eternal bliss, and also the cause of bondage for this world; she, who lords over the Lord of the universe.' And in another passage of the same work, she is invoked thus: 'O Devî, thou art the seed of the universe, the highest Mâyâ (q. v.); all this world is bewildered, but, descending on earth, thou art the cause of its final liberation; all the sciences are merely different modes of thyself.' Similarly, also, in the *Mahâbhârata* (q. v.), Arjuna says to her: 'Of sciences thou art the Brahma-science,' &c.; and in the *Harivans'a*, Vishn'u addresses her as Saraswatî, the goddess of eloquence, as Smriti, tradition, and, of sciences, as the Brahma-science, &c.

The myths relating to this goddess, who is worshiped in various parts of India—particularly, however, in Bengal (see S'AKTAS)—are met with in the great epic poems and Purân'as, in poetical works, such as the *Kumârasambhava* (see KALIDASA), and in modern popular compositions; but the text-book of her worshipers is the *Devîmâhâtmya*, or 'the majesty of Devî'—a celebrated portion of the *Mârkan'd'eya Purân'a*, and considered to be of especial holiness by the worshipers of this goddess. In the *Râmâyan'a* (q. v.), she is spoken of as the daughter of Mount Himâlaya (her names *Pârvatî*, *Haimavatî*, *Adrijâ*, *Girijâ*, and similar ones, mean 'the mountainous or the mountain-born'), and of the nymph Menâ, whose elder daughter, however, was the Ganges.

According to the Vishn'u and other Purân'as, she was in a former life *Satî*, the daughter of Daksha, who abandoned her corporeal existence in consequence of having been slighted by her father when he performed a great sacrifice, and did not invite S'iva to share in it; but it was only as Umâ that she bore children to her husband, viz., *Ganes'a*, the god of wisdom, and *Kârttikeya* (q. v.), the god of war. According to the *Harivans'a*, she was, in another life, born as the daughter of Yas'odâ, and exchanged for *Vishn'u*, when in his incarnation as *Kr'ishn'a*, he was born as a son of Devakî. See VISHN'U. On that occasion she was killed by *Kansa* (q. v.); but as soon as he had dashed her to the ground, she rose to the sky, leaving behind her corporeal frame, and became a divine virgin, to whom the gods addressed their praises. Hence her names *Kanyâ*, *Kumârî*, &c., the virgin. This connection between the legendary history of Umâ and Vishn'u is also briefly referred to in the *Devîmâhâtmya*, though this work is chiefly concerned in the narrative of the martial feats of the goddess. The latter consisted in the destruction by her of two demons, *Madhu* and *Kait'abha*, who had endangered the existence of the god Brahman; and of the demon *Mahisha* or *Mahishâsura*, who, having conquered all the gods, had expelled them from heaven, and who met Devî, assisted only by her lion, with a numberless host of demons; moreover, in her defeating the army of *Chan'd'a* and *Mun'd'a*, two demon-servants of S'umbha and Nis'umbha; in her killing the demon *Raktavîja*, who had a sort of charmed life, each drop of his blood, when shed, producing hundreds of demons like himself; and ultimately, in her destroying the demons *S'umbha* and *Nis'umbha* themselves. In commemoration of her victory over Mahishâsura, a festival called the *Durgâpûjâ*, or *Durgotsava*, is annually celebrated in Bengal. 'The goddess,' the Rev. Mr. Banerjea relates in his introduction to the *Mârkan'd'eya Purân'a*, 'is there represented with ten arms, trampling upon the demon, who is also attacked by her lion, and wounded in the chest by her spear. She has also laid hold of him by the hair, and is about to chop off his head.

'The most popular commemoration of this event takes place in the autumn, about the time of the equinox; and if the practice may be supposed to be 800 or 1000 years old, it is not inconceivable that it was originally fixed at the equinox, though the precession has since made it a few days later. The calculation of the day depends, however, on a certain lunar day; but it can never be earlier than the seventh of As'win, which is about the time of our present equinox; nor can it be more than a month later than that date. The idea of the possible connection of the *Durgâpûjâ* with the equinox, is suggested by the fact, that there is a corresponding festival about the time of the vernal equinox too, in which, though it is not so popular as the autumnal *pûjâ*, the same group of figures is constructed, and the image of the goddess is in the same attitude, with the same attendance, and the same enemy.' (For a somewhat more detailed account of this festival, see Moor's *Hindu Pantheon*, p. 156.) Three weeks after the *Durgâpûjâ*, another festival in honor of this goddess, called the *Kâlîpûjâ*, takes place, to commemorate her victory over *Chan'd'a* and *Mun'd'a*. 'The sable goddess,' Mr. Banerjea says, 'is represented holding the severed head of Chan'd'a in her hand, with the heads of his soldiers formed into a garland suspended from her neck, and their hands wreathed into a covering round her loins—the only covering she has in the image constructed for the *pûjâ*. The worship

Kali (after the figure in Coleman's *Mythology of the Hindus*).

of *Kâlî* (i. e., the Black), to which the narrative (of her victory over Chan'd'a and Mun'd'a) has given rise, is considered by the Hindus themselves as embodying the principle of *tamas*, or darkness. She is represented as delighting in the slaughter of her foes, though capable of kindlier feelings to her friends. She is, however, styled the Black Goddess of Terror, frequenting cemeteries, and presiding over terrible sprites, fond of bloody sacrifices; and her worship taking place in the darkest night of the month.' (For this worship, see also the article THUG.) With S'iva, she resides on Mount *Kailâsa*, the northern peak of the Himâlaya, or in her own palace on the Vindhya mountain, where she amuses herself with hunting. Her representations are numerous and various. Sometimes she is seen riding on a bull, with a trident in her hand, a serpent as bracelet, and a half-moon on her forehead; sometimes, when in the act of fighting Mahishâsura, she rides on her lion (*Manastâla*), the latter standing between the frontal bones of her elephant. Or, as *Bhadra-Kâlî*, she is represented 'eight-handed, two of her hands being empty, pointing upward and downward, one of her right hands holding something like a caduceus, its corresponding left hand, a cup; the next right and left hands, a crooked sword, and a shield with an embossed flower or fruit; the superior right hand, an agricultural implement; and the left, the noose to strangle victims with [see THUG]. Her person is richly dressed and ornamented; between her full breasts, a five-headed serpent uprears itself; she has a necklace of human heads; her ear-drops are elephants; and a row of snake-heads peeps over her coronet. Her forehead is marked either with S'iva's third eye, or her own symbol; and her open mouth shows her teeth and tusks, giving her a fierce and threatening aspect.' See Moor's *Hindu Pantheon*, where, besides, other descriptions of images of this goddess are given.—For the myths relating to her, see John Muir's excellent work, the *Original Sanskrit Texts*, vol. iv. (Lond. 1863; the *Harivans'a*, translated by A. Langlois (Paris, 1834—1835); and the *Mârkan'd'eya Purân'a*, in the *Bibliotheca Indica*, edited, with an elaborate Preface, by the Rev. K. M. Banerjea (Calcutta, 1862).

UMA'N, a town of Russia, in the government of Kiev, 120 miles south of the town of Kiev, on the Umanka. It is enclosed by earthen ramparts. Pop. (1880) 15,393.

UMBA'LLA, or AMBA'LA, a walled town of India, in a division of the same name in the Punjab, 120 m. N.N.W. of Delhi. Under the walls of the fort are the British cantonments. Pop. (1868) of city, 24,040; of cantonments, 16,622; of division, 1,652,728.

U'MBEL. See UMBELLIFERÆ.

UMBELLI'FERÆ (*Apiaceæ* of Lindley), a large and important natural order of exogenous plants, containing more than 1000 species, abounding chiefly in the temperate regions of the northern hemisphere. A peculiar regularity distinguishes the inflorescence of most of this order; a number of stalks, radiating from a common center at the top of the stem, or of a branch, each of which bears a flower at its extremity, thus forming what is called an *umbel*. The umbel is often compound, the primary stalks dividing in a radiated manner, and forming *secondary umbels* or *umbellules*. The flowers are generally small, although the umbel which they compose is often large. They are generally white, rarely yellow, still more rarely red, though frequently tinged with pink at the edges; have a 5-toothed calyx, often obsolete, or nearly so; a corolla of five petals, inserted in the top of the calyx, and alternating with its teeth, five stamens, an inferior germen, and two styles. The fruit is very peculiar, and consists of two one-seeded, unopening carpels, rarely fleshy, touching one another on the inner side, and there attached to a little column (the *carpophore*), their common axis. Each carpel has five primary and four secondary longitudinal ridges, more or less distinct; and beneath the separating furrows there are often linear receptacles of essential oil, called *vittæ*. The U. are mostly herbaceous plants, rarely shrubby. They generally have divided or compound, rarely simple leaves. They generally abound in a resinous secretion, and a volatile oil, from which many of them derive poisonous and medicinal properties, which are more or less common to all parts of the plant, and often highly developed in the seeds.

Acridity is their general characteristic. Some are pleasantly aromatic, others have a powerful and disagreeable smell. In the roots of some, especially when enlarged by cultivation, starch and sugar are secreted, so that they become useful for food, although the peculiar flavor of the essential oil is still retained. The systematic arrangement of the U. has been found difficult by botanists. Sprengel, De Candolle, Koch, and others, have devoted much attention to this order. Of esculent-rooted U., the carrot and parsnip are the best known examples. Skirret, earth-nut, and arracacha are also of some value. The roots of *Anesorhiza Capensis* and *Fœniculum Capense* are used as esculents at the Cape of Good Hope. The roots of *Chærophyllum tuberosum*, or SHAM, are used in the Himalaya. The herbage of *Prangos pabularia* is so bland that it is much used in the temperate parts of the East Indies for feeding cattle, and made into hay for winter fodder. It is said, however, to be injurious to horses, although oxen and sheep are rapidly fattened by it. The blanched stems of celery, enlarged by cultivation, are a favorite salad, and those of Alexanders (*Smyrnium olusatrum*) were formerly used in the same way. The candied stalks of eryngo were once much esteemed, and those of angelica are still used. The leaves of parsley, chervil, fennel, &c., are used for flavoring. Lovage (*Levisticum officinale*) is sometimes cultivated as a salad plant. The seeds of anise, caraway, coriander, &c., are used as carminatives. Hemlock, water hemlock, water parsnip, fool's parsley, and many others, are narcotic poisons—asafœtida, galbanum, sagapenum, and opoponax are medicinal products of this order.

U'MBER (*Scopus umbretta*), an African bird of the family *Ardeidæ*, allied to the storks, but having a compressed bill with sharp ridge, the tip of the upper mandible hooked, and the nostrils

Umber (*Scopus umbretta*).

situated in a furrow which extends all the length of the bill. It is about the size of a crow, with umber-colored plumage, and the male has a large crest on the back of the head.

UMBER, a minerel used as a pigment, a variety of the iron ore called Hæmatite (q. v.), and consisting chiefly of oxide of iron, with some oxide of manganese, silica, alumina, and water. It is soft and earthy, of a dark brown color, and has a conchoidal fracture. It readily imbibes water, and falls to pieces, like newly-burnt lime. It is found in Cyprus in beds. When roasted, it becomes reddish brown in color, and in that state is also used as an artist's color.

UMBI'LICAL CORD, or NAVEL STRING, the bond of communication between the fœtus (which it enters at the umbilicus, or navel) and the placenta, which is attached to the inner surface of the maternal womb. It consists of the umbilical vein lying in the center, and the two umbilical arteries winding from left to right round the vein. Contrary to the usual course, the vein conveys arterial blood to the fœtus, and the arteries return venous blood to the placenta. These vessels are imbedded in a yellow gelatinous matter, known from its first describer (in 1659) as Wharton's gelatine. Nervous filaments have been traced into the cord; but the presence of lymphatics is doubtful. The whole is invested by a membrane (the amnion), and its ordinary length is about 20 inches. As soon as a child is born, and its respiration fairly established, the umbilical cord is tied, and divided near the navel, which spontaneously closes, the fragment of attached cord dying away. See the articles FŒTUS (in which there is a figure of the umbilical cord) and PLACENTA.

UMBILICAL CORD, in Botany, the connecting link between the placenta of the ovary and the ovule, through which pass the vessels which nourish the ovule till it ripens into the seed. In some plants, the ovules are so closely connected with the placenta, that no umbilical cord can be said to exist; in others, it is of considerable length.

UMBILICAL HERNIA is the term applied to the protrusion of intestine at the navel or umbilicus. It is for obvious anatomical reasons, of most frequent occurrence shortly after birth; but it is not uncommon in women who have been frequently pregnant. If the hernia is reducible, and the patient an infant, the ordinary course of treatment is, after returning the parts to their proper position, to place the convex surface of an ivory hemisphere on the navel, and to retain it there either with strips of adhesive plaster, or with a bandage. Special trusses are made for the treatment of this affection in adults. In cases of irreducible hernia, a large hollow pad should be worn. If it becomes strangulared an operation may become necessary.

UMBILI'CUS is the anatomical term for the navel.
